Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

+ *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.
+ *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.
+ *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.
+ *Manténgase siempre dentro de la legalidad* Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

Acerca de la Búsqueda de libros de Google

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página `http://books.google.com`

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

ELECTRICITY,

A Popular Electrical and Financial Journal.

PUBLISHED WEEKLY BY

Electricity Newspaper Co.,

136 LIBERTY STREET,

NEW YORK.

VOLUME XIX.

Nos. 1 to 26 inclusive.

JULY 11, 1900, TO JANUARY 2, 1901.

A

Accidents in Electricity Works, 316.
Advance in Telephone Rates, 123.
American Bell Telephone Company—President pro tem, 223.
American Street Railway Association Convention, 229, 247.
American Telephone & Telegraph Company, 271.
American Motors for European Canals, 350.
Another Independent Company for Minnesota, 335.
AUTHORS:—
Adams, Alton D.: Materials Used in the Construction of Marine Dynamos and Their Engines, 361.
Addenbrooke, G. L.: The Accurate Measurement of Alternating and Multiphase Currents, 251.
Aldridge, J. G. W.: The Automobile for Electric Street Traction, 184.
Allingham, G. C.: Interior Wiring, 235.
Baily, Prof. F.G.: Dirt Marks and Electrical Conductors, 116.
Bancroft, C. F.: Comparisons of the Various Systems of Electrical Distribution for Street Railways, 264.
Barwell, H. G.: An Explanation of a Common Phenomenon Noticed in Cable Work, 217.
Barker, T.: A Combination Integrating Wattmeter and Maximum Demand Indicator, 197.
Bean, W. Worth: Advantages of Recording Wattmeters on Switchboards, 21.
Behr, F. S.: Manchester & Liverpool Railway—Brakes and Signals, 197.
Bleyer, J. Mount, M. D.: The Bleyer Electro-Arc Chromolumes for Generating Colored Light Rays, 364.
Blondel, Prof. Andre: Progress in Electric Lamps, 313.
Brook, E.: Electrically-Driven Shops, 72.
Burgher, Charles: Automatic Fire Alarm Systems, 233.
"Busyback ": Some Interesting Faults on Telephone Circuits, 88.
Camp, W. J.: The Use of the Dynamo and Storage Battery in Telegraph Offices, 216.
Cowper-Coles, Sherard: Practical Methods of Overcoming the Vibrations Caused by Motors, 361.
Danforth, Richard E.: Snow and Snow Plows, 284.
Davies, F. W.: A New Constant-Potential Continuous Current Transformer, 283.
Davidson, A.: Recorder Working on Composite Landline and Cable Circuits, 411.
Eaton, R. Max: ELECTRICITY's Educational Series, 296, 312, 327, 344, 360, 376, 392, 408.
Edgar, William H.: Wet Steam, 6.
Fletcher, Spencer L.: Some Notes on Dr. R. C. Shettle's View of the Ultimate Nature of Electricity, 133.
Floy, Henry: The Plant of the St. Croix

Digitized by Google

Power Company of Wisconsin, 348.
Fournier, L.: The Electric Station of the Eiffel Tower, 318.
Gunderloch, F.: The Relative Advantages of Narrow and Standard Gauges for Electric Roads, 313.
Hall, Geo. L.: Railway Joints and Track, 268.
Harris, G.M.: The Lighting of Small Towns, 9.
Hatch, F. E.: A Patent Electric Smelter, 8.
Heap, Arthur C.: Measurement of the Resistance of Cables, 250.
Heft, N. H.: Double Truck Cars—How to Construct and Equip Them to Obtain Maximum Efficiency With Minimum Cost of Maintenance, 267.
Hendrickson, Howard: Rate Meters, 89.
Hering, Carl: The Paris Exposition of 1900. 328.
Higgins, P. Kerr: Electrolysis in Telephony, 299.
Highfield. J. S.: Destructor and Electri Power Station at St. Helens, England, 39.
Hill, Claude W.: Motors, 100.
Holmes, Daniel B.: Consolidation of Street Railways and its Effect Upon the Public. 281.
Humphreys, W. J: Spark-Length as Modified by Solid Dielectrics, 236.
Jones, Forrest R.: Power and Light for the Machine Shop and Foundry, 378.
Kershaw, John B. C.: Power Generation, 183.
Orde, E. L.: Liquid Fuel, 409.
Mason, F. C.: Electrical Contacts, 219.
Mead, Morris W.: Should the Use of Ground Wires in Connection With Fire Alarm Telegraph Be Discontinued, 232.
Miles, H. D.: Automatic Block Signal Failures Due to Lightning, 165.
Morton, W. B.: Note on the Propagation of Electric Waves Along Parallel Wires, 180.
Perkins, Frank C.: Electrically-Operated Railway Turntable, 4; Paris Exhibit of the Helios Company 20; International Electric Company's Exhibit at Paris, 68; A High Tension Direct Current Power Transmission, 86; Modern Electrically Operated Machine Lathes, 100; Lahmeyer Exhibit a the Paris Exposition, 152; Electric Mining Machinery and Locomotives, 218; Additional Niagara Power, 232; Austrian Electrical Exhibits at Paris, 281; A Modern Polyphase Central Station in Switzerland, 347; High Tension Power Transmission Plants in France, 394, 410.
Perrine, Frederic, A. C.: Regulation in Long-Distance Transmission, 101.
Pope, Henry W.: The Railway and the Telephone, 36.
Poulsen, Valdemar: The Telegraphone—A Magnetic Speech Recorder, 377.
Preece, Sir William Henry: Wireless Telephony, 197.
Quin, R. C.: The Protection of Telegraph and Telephone Wires in Connection with Overhead Traction, 39.
Reist, H. G.: Alternating Current Generators, 22.
Robertson, David: Dust Figures of Electrostatic Lines of Force, 180.
Rowland, Arthur J.: Mistakes in the Rating of Incandescent Lamps, 198.
Seager, J. A.: Some Notes on Inquiries for Engines, 86.
Segundo, E. C. De, A. M. I. C. E.: The Efficiency of the Steam Engine, 19.
Stevens, J. Franklin: Electrical Measuring Instruments, 54, 70.
Summerfield, R. D.: The Prevention of Scale and Corrosion in Boilers, 68.
Sunderland, A. E.; Electro-Chemistry in a Dye and Print Works, 166.
Tommasi, D.: Wireless Telegraphy Apparatus to Prevent the Interception of Messages, 7.
Van Nostrand, B. B.: Storage Battery—Its Use on Small Roads, 196.
Wetmore, Jean: Fire Protection for Life and Property, 52.
Wilmshurst, T. P.: Power Supply by Single-Phase Motors. 24.
Wilkes, John: Gas Engines and the Economy of Gasoline Engines for Small Power, 117.
Wordingham, C. H , M.I.C.E.: On the Maintenance of Certain Portions of Distributing Systems at Earth Potential, 149.
Wright, J.: The Ethics of Insulating Materials, 220; Some Interesting Faults Met With in Cable Manufacture, 265; Notes on the Testing of Modern Dielectrics at High Voltages, 297.
Yaryan. H. T.: Hot-Water Heating from a Central Station, 4.
Automobiles in Military Use. 116.
Automobile Exhibition, 57.
Awarded Two Good Contracts, 26.

B

Bacterial Light. 267.
Bell Telephone Company Wins $12,000,000 Suit, 399.
Bell Company Restrained, 415.
Belle Isle Telegraph Line. 269.
Birdseye View of the Pan-American Exposition, 397.
Big Railroad Deal in Connecticut, 398.
Bois De Boulogne Combined Trolley and Surface Contact Tramway, The, 132.
Buffalo's Art Palace, 40.

C

Canadian Notes:—
Pages 10, 26, 90, 106, 137, 185, 270, 302, 318, 381, 414.
Cancellation of Bonds for the Free Zone, 100.
Care of Boilers, 411.
Central London Railway, The, 3, 269.
Cheaper 'Phones for Camden, N. J., 303.
City of London Electricity Supply, The, 316.
Coal at One End, Power at the Other—the Lubricant in Between, 42.
Commercial Paragraphs:—
Pages 106, 138, 222, 302, 318, 382.
Commelin and Viau Cadmium Accumulator, The, 363.
Concerning Hot Wire Instruments, 121.
Count Zeppelin's Airship, 73.

D

Direct Current Generators at the Paris Exposition, 205.
Direct Current Arc, The, 412.
Dixon's Graphitoleo, 222.
Duplex Telephony, 255.
Duplex Telephony Introduced in Chicago, 415.
Dynamo Ills and Remedies, 331.

E

Editorial Notes:—
Abuse of the Word Electrical, The, 309.
Again the Brooklyn Bridge and Electrolysis, 113.
American Street Railway Financier in London, An, 65.
American Street Railway Convention, The, 246.
American Trade Interests Abroad, 246.
American Coal for Foreign Consumption, 130.
American Capital to Furnish Londoners with Transportation, 162.
Another Alleged Electrical Cure for Tuberculosis, 65.
Another System for Purifying Sewage by Electricity, 374.
Automobile Show for Washington, An, 214.
Automobile Shows, Two, 293.
Brake Question, The, 145.
Can the Energy Lost in Resistance be Utilized. 82.
Christmas—the Last of the Century, 373.
Coming Electrical Events, 114.
Coming Electrical Congress at Paris. The, 81.
Convention of the International Association of Municipal Electricians, The, 146.
Developments in Wireless Telegraphy, 357.
Disposal of Town Refuse, 213.
Electricity as a Fire Hazard, 2.
Electrical Congress of the Paris Exposition, The, 17.
Electricity from Heat, 81.
Electric Haulage for Canals, 245.
Electric Brakes Superior to Hand-Brakes for Street Cars, 49.
Electricity as a Hazard to Life and Property, 98.
Electro-Culture, 34.
Electricity Must be Used, 1.
Electricity's Educational Series, 277, 293, 357.
Electric Guns, 262.
Electricity and Fires, 294.
Electricity in the Growing of Crops, 145.
Electrical Undertakings in Russia, 129.
Electric Vehicle Trials in England, 310.
Electro-Magnetic Gold-Extracting Process, An, 389.
English View of Nikola Tesla's Invention, An, 177.
Experiment Looking to the Abolishment of the Centralized Labor System, An, 34.
Exports of Electrical Apparatus, 405.
Features of the South Carolina Interstate Exposition, 358.
General Electric Company Increases Its Capital Stock, 33.
Havana's Street Railway, 177.
High Speed Electric Railway Scheme, A, 50.
Important Patent Suit, An, 261.
Is the Problem of Aerial Navigation Solved? 341.
Journalistic Amenities, 161.
Lighting of Railway Trains, The, 406.
Mica Production of this Country, The, 326.
Motor Power Schemes Abroad, 246.

EDITORIAL NOTES.

Electricity Must Be Used.

The recent disastrous fire in New York harbor, which destroyed upwards of $6,000,000 worth of property and blotted out over 300 human lives, again calls our attention to the highly inflammable material used in the construction of the wharves and storehouses lining our river fronts, and emphasizes the lack of adequate up-to-date means for fire protection.

Our commercial growth has fast outstripped our antiquated methods of protecting life and property; our pigmy wheeled fire engines have many times proved themselves practically useless to cope with a rapid and serious conflagration.

An original contribution to our columns of Dec. 21, 1898, made this fact plainly apparent as regards the late Home Life Building fire, and the late conflagration on our river front calls our attention to another division of the subject. It was as useless to attempt to quench this horrible fire, with our present facilities as it would have been to prevent a powder mill from blowing up after the powder was ignited. Our great commercial growth requires improved and commensurate facilities for fire protection.

Electricity has been the means to meet the increased demands of lighting and of disinfecting on a large scale; of supplying the demands for power for transportation purposes throughout a large metropolis; of curing diseases and prolonging life, and it will yet be the agent used in preventing conflagrations and subduing them when once under full headway.

The applications of this subtle agent have become so universal that we feel safe in even this prediction, for here, as probably in all other uses, it will find its greatest utility from the ease in which its qualities may be brought into service from far distant points, as well as for its other wonderful quality of being spontaneous in the manifestation of its effects. These two inherent qualities above all others make it better adapted to modern uses, and, speaking in general terms, as being superior to our present comparatively slow and ineffective means of fighting great fires. The Hoboken conflagration presented the lamentable spectacle of a large amount of highly combustible material of great value, closely surrounded on nearly all sides with water, in fact an ocean to draw from, but scarcely an effective drop to be utilized in time, that is, when most needed at the commencement.

There were some small fire engines in electrical communication with the wharves no doubt, but they were in distant localities and could not arrive in time. There were the more powerful fire boats, better capable of dealing with the problem; they were also at distant stations and arrived too late—another case of slow locomotion.

The old idea of transporting heavy instruments over distances that take up precious time, to be used for fighting conflagrations, appears to us as ridiculous, when by quickly turning an electric switch there was to be had enough electric power on tap in Hoboken to have almost washed instantly into the river the burning piers with their contents and superstructures, even if only utilized from the vantage ground of the adjoining piers.

This is why we say that electricity, instantaneous in its operation, capable of transmitting great power effectively over long distances, will eventually be universally used for fighting fires, and will relegate our present almost worthless fire fighting apparatus to the scrap heap.

New Submarine Boats for the Navy.

After considerable backing and filling it is now definitely decided that the United States Government shall keep abreast of the times, Congress, before adjourning, having authorized Secretary Long to order from inventor Holland five new boats, similar in general detail to the submarine boats Holland and Plunger. This will give the United States a submarine boat flotilla equal in number to that of France, and if reports are to be believed, far superior to the Gustave Zédé type or any other that has been experimented with by our sister Republic. In this connection, says a writer in the Washington "Star," it is worthy of some attention that outside of France, which contemplates adding at an early date twenty-six more vessels of this character to its fleet, no other foreign nation is giving serious attention to submarine navigation. England has never taken the matter up. The Germans made an unsatisfactory experiment some years ago. The Russians commenced one boat but discontinued it. Turkey has two so-called submarine boats, launched

New Submarine Boats for the Navy.

After considerable backing and filling it is now definitely decided that the United States Government shall keep abreast of the times, Congress, before adjourning, having authorized Secretary Long to order from inventor Holland five new boats, similar in general detail to the submarine boats Holland and Plunger. This will give the United States a submarine boat flotilla equal in number to that of France, and if reports are to be believed, far superior to the Gustave Zédé type or any other that has been experimented with by our sister Republic. In this connection, says a writer in the Washington "Star," it is worthy of some attention that outside of France, which contemplates adding at an early date twenty-six more vessels of this character to its fleet, no other foreign nation is giving serious attention to submarine navigation. England has never taken the matter up. The Germans made an unsatisfactory experiment some years ago. The Russians commenced one boat but discontinued it. Turkey has two so-called submarine boats, launched

Digitized by Google

fourteen years ago. Italy has a little one five years old and Portugal has one dating back to 1892.

As stated in the issue of ELECTRICITY of March 30, 1898, the principal stumbling-block in the way of success which early inventors of submarine boats had to contend with was in finding a suitable motive power wherewith to operate a boat while running on the surface and under water. This problem has been fairly well solved by Mr. Holland by employing two forms of power—gasoline when awash and electricity when submerged. Several new features will be embodied in the new boats which are absent in the Holland. In the first place, the length will be 63¼ feet as against 53 feet, and the width will be 11⅝ feet as compared to 10¼ feet. This increase in the dimensions is much to be desired as it will afford room for a crew of seven men, whereas the Holland could only accommodate five. Furthermore, the surface radius of action, 1,000 miles in the present vessel, will be increased to 1,500 miles. The increase in the size of the vessel and likewise its radius of action, will necessitate a greater propelling power, so that it is proposed to install a new type of alternating gasoline engine for surface propulsion capable of exerting a force of 180 horse power as against the Holland's 50. For submerged runs there will be employed a new improvement in water-proof motors driven by sixty storage batteries located in the bottom of the vessel and serving as ballast. The boats will be illuminated by electricity and will be provided throughout with electric bells for communicating purposes. By means of a new device, whenever one of the crew moves sufficient water to compensate for the disturbance of the vessel's trim will be admitted to or expelled from the proper compartment.

Six months will be required to build each of the five boats, which it is estimated will cost 170,000 apiece. All will not be begun at the same time. They will be finished probably a month or six weeks apart, which will permit of any defects in one being remedied in those of later construction. When completed, if they prove successful on trial, their construction, according to an authority, will probably be continued at the rate of five or six a year, and thus all improvements suggested by the continuous series of experiments will be gradually embodied in the little vessels as fast as they are launched.

* * *

Electricity As a Fire Hazard. A report has recently been handed in by the Committee on Lighting and Heating of the National Board of Fire Underwriters which has attracted considerable attention. The committee points out that the electrical bureau of the Board had listed up to April 10, 1900, 2,650 fires of electrical origin, and quotes the Chronicle Fire Tables, showing 3,022 fires, involving a loss of $32,510,-558, during the past ten years. "We think it likely," says the "Insurance Advocate," commenting on the subject, "that the record of electrical fires is very imperfect owing to the fact that electric wires are mostly cut of sight, under floors and between walls, so that more often than not it is impossible to trace the origin of the fire to a certainty."

That electricity is responsible for very many fires there is not the slightest doubt, due to various causes, such as poor workmanship, inadequate inspection, etc. On the other hand we think that very frequently a conflagration is attributed to a defective system of wiring, when in reality some other cause should be sought for. However this may be, there is no denying the fact that there are more fires of electrical origin than there should be or would be were rules of the National Board of Fire Underwriters more universally heeded. As our above mentioned contemporary states, last year the National Board directed its Executive Committee to appoint a special committee to confer with representatives of the union, S. E. T. A., and other bodies, with a view to placing all tests of electrical devices in charge of the Board. The special committee evolved a plan for the establishment of a board of consulting engineers, to be appointed by the Executive Committee, and to consist of representatives of the leading tariff associations and local boards. The National Board itself is represented on this board of engineers, the Executive Committee having engaged Mr. G. E. Bruen, of New York, for the work. The tests will be made, so far as possible, in Chicago.

Mr. Bruen, says the "Insurance Advocate," has visited a number of the leading cities of Texas and found there conditions that seem to call for immediate action. Similar conditions exist in other parts of the country. A form of permit is proposed requiring all installations to be made and maintained in compliance with the current edition of the National Electrical Code. The committee has sent a blank to cities of 20,000 population and over to ascertain whether ordinances are in force governing electrical installations, and whether, if any exist, they are based on the National Electrical Code.

Many cities have responded satisfactorily to these inquiries, but a large number have not, and until every municipality provides for a vigorous inspection wherever electricity is used in any form there is bound to be poor and hasty workmanship, which may ultimately occasion a heavy loss by fire. That competent municipal inspection is much needed we have frequently stated in these columns, and is forcibly illustrated in the fact shown by statistics that the principal losses by fire through defective electrical installations have been in localities where no suitable ordinance relating to the supervision of electrical hazards has been in force.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

ONE by one the difficulties and objections attending the use of wireless telegraphy are being surmounted. Thoughtful and patient inventors may yet make this new system of communication realize all that was claimed for it originally. It is a well known fact that our great inventions with few, if any exceptions, owe their utility to improvements by many minds. Bell telephone stock that went begging for ten cents a share was made highly valuable by the Blake transmitter and other improvements. The delicate siphon recorder gave to submarine telegraphy the required means to make this a grand uniting bond between the widely separated nations of the earth. The progress in wireless telegraphy is obeying the same general rule. One of the often quoted objections to this method has been the ease with which its messages could be read by those for whom they were not intended. Our present issue contains a translation from our esteemed French contemporary, "La Vie Scientifique," of an interesting improvement in this direction by D. Tommasi, that appears to promise a simple solution, especially as barring out interlopers, with receiving apparatus at intermediate points. Mr. Tommasi's invention is clearly explained in this article and it is well worthy of attention.

MANUFACTURERS of electrical supplies are endeavoring to obtain a revision of the railroad freight classification, which rates all of their products as first-class freight and some articles as double first-class. A suit in the United States Court is threatened to enforce the Interstate Commerce law provision against discrimination. Complaint is made that the electrical supply industry is seriously hampered because the railroads charge the highest rates for carrying electrical goods. It is alleged that first-class rates are charged on a number of articles when shipped as electrical supplies, when the same articles are carried as third-class frieght when used for other purposes.

THE following cable dispatch from London was deemed worthy of a "spread-head" in the N. Y. "World:" "Experiments in growing potatoes by electricity have been undertaken by the Irish Agricultural Board. Father Glynn, of Athea, Limerick, in charge of the experiments, studded a potato patch with lightning conductors connected by wires running through the patch. The result was an increase of 80 per cent. in the yield in the section so treated. Should the official experiments bear out this experience a solvent for the chronic distress in the west of Ireland will have been found. Horace Plunkett, M. P., Vice-President of the Agricultural Board, says: "This most remarkable phenomenon may be the forerunner of a revolution in agriculture. The evidence furnished and the genuineness of Father Glynn's experiment are incontrovertible."

ELECTRICITY as a means for the ending of the lives of the dogs which may fall into the hands of the official dog catcher is being talked of in Columbus, O. City Electrician John Morris suggests that a kennel be arranged with a flooring of copper strips of opposite polarization and that the dogs be driven in it, the wires connected with these copper strips and the current turned on—then dead dog. In this way as many dogs as the pen could contain would be killed together.

SEVENTEEN automatic telephones are now in use in various places in Melbourne, Australia, and suburbs, and their introduction has proved a financial success. The machines at two railway stations have so far returned at the rate of between £20 and £25 per year. So satisfied is the Melbourne Postal Department with this experiment, that arrangements are being made to raise the number of instruments to 50.

A NEW use for the graphophone has been found in New South Wales, where a candidate who found it impossible to visit all parts of the sparsely settled region he wished to represent in the Legislature, dictated his speech into an instrument and sent a number of copies about for his constituentsto hear, and a large picture of himself helping the voters to know who they were voting for.

THE inventory of the personal estate of the late Garret A. Hobart was filed with the surrogate at Paterson, N. J., Monday. It appraises the late Vice-President's wealth at $2,628,941. Mr. Hobart held bonds in about twenty-six corporations (among which were a number of electrical companies), and stock in more than one hundred other concerns.

MR. W. W. SKILES, president of the Shelby Electrical Company, Shelby, Ohio., has received the nomination for Member of Congress of the Fourteenth District of Ohio. His election is predicted by a large majority.

UPWARDS of $60,000 is to be spent in the modern equipment of the Nagoyo (Japan) Electric Light Company. The company proposes to begin operations by using 5,000 lights and in the near future its capacity is to be increased.

THE Post-Office authorities of London are preparing to lay pneumatic tubes for the delivery of letters similar to those used in New York. There are already thirty-four miles of pneumatic tubes working there, but these are only six inches in diameter and are found to be inadequate. The American tubes will be from twelve to sixteen inches in diameter. At present it takes longer to get a letter from one end of London to the other than it does from Manchester to London.

THE street railways of Havana are to change the motive power from horses to electricity. The city is in great need of rapid transit.

THE St. Louis Transit Company is augmenting its force of employes and its transportation facilities to such an extent that all semblance of a strike promises to disappear in the near future.

THE policemen at Asbury Park, N. J., have been provided with electric pocket lights, which they use to discourage young couples from the practice of being too affectionate on the beach after sundown. The founder of the park is very strict in enforcing the observance of all the proprieties, and so officers of the law will flash their tiny electric illuminators wherever a suspicion of beach love-making exists.

IT is stated that a famine of gutta-percha, says the N. Y. "Sun," is threatened through several causes, and no greater calamity could overtake the cable companies. No other substance is comparable with this gum for the insulation of cables; indeed, long distance cables cannot be made with any other insulation hitherto discovered. The causes of its scarcity are several. It grows only in a limited area, principally in the Malay peninsula, Borneo, Java and the adjacent islands. The tree is of very slow growth, requiring thirty years to reach maturity. The gum is gathered by the natives, who have used most wasteful methods, generally resulting in the destruction of the tree. Now that the gum is valued at more than $1.50 a pound the incentive to dishonesty is too great for the Malay character, and much of the gutta-percha coming into the market is so adulterated as to be worthless. Singularly enough, the popularity of golf has had much to do with the extinction of the gutta tree. Golf balls are made of gutta-percha and enough is used for their manufacture every year to insulate a transatlantic cable. The increase of demand on this account and consequent increase of the value of the gum have stimulated the native gatherers to wholesale destruction of the gutta forests, their favorite method of saving time and labor in collecting gutta being to cut down the tree. If the Pacific cable is to be built at once, it is doubtful if there is enough gutta-percha in the world to make it. Here, then, is where necessity must again bring forth invention, for a substitute for the gum is urgently needed. Meanwhile, the Philippine Islands, especially the southern ones, have the proper soil and climate for the gutta-percha tree, and the United States Government has an admirable opportunity to foster the growth of a highly valuable product there.

A PECULIAR but very serious difficulty besets the operation of telegraph lines in the Argentine Republic. The small spider, of the variety that spins a long cobweb and floats on it in the air is so plentiful there that the floating webs settle on the wires in enormous quantities. As soon as dew falls or a shower of rain comes up, every microscopic thread becomes wet and establishes a minute leak. The effect of thousands and millions of such leaks is practically to stop the operation of the lines, and the Government telegraph department, especially in Buenos Ayres, has been put to vast inconvenience by the cobwebs. A number of expedients have been tried but to no avail. On the important line between Buenos Ayres and Rosario the effect of the spider webs is to cut down the speed of working from 300 or 400 to 30 messages an honr. The Government has just determined, as a last resort, to connect the two points by an underground cable about one hundred and fifty miles long.

THE cable steamship Silvertown, a British vessel belonging to the Telegraph Construction & Maintenance Company of London, left her anchorage in the upper bay Monday to begin the work of laying the Commercial Cable Company's new cable between Coney Island and Fox Bay, Canso, N.S. The cable is to make connection at that point with the cable which the Faraday recently laid to the Azores. Manager Director R. K. Gray, who arrived on the Oceanic last Wednesday, is on board the Silvertown, and will remain there until the 950 knots of cable have been placed.

IN weaving with the complicated Jacquard loom a great improvement has been introduced, consisting of manipulating the hooks controlling the various threads by electricity. The Jacquard loom is used in weaving colored or embroided figures on silks, etc., and is able to produce very complex patterns. Hitherto the hooks have been controlled by cards, punched with holes corresponding to the desired appearances of the warp threads. In the new method the patterns are drawn directly on metallic sheets, or they may be photographed on them from the designer's drawing. Electrical contact points passing over the design strike the insulating ink in which it is drawn and breaking contact at the appropriate instants, control the motion of the web through electromagnets. Both the simplicity and speed of Jacquard weaving is increased in this way. At Glasgow, Scotland, a large new factory has been started to use this method, and it is thought that it will also be applied to carpet looms.

LONDON NOTES.

[From our London Correspondent.]

The Mnnicipal Electrical Association.

This year's annual convention of this Association, opening on June 20, was under the presidency of Mr. A. B. Mountain, the borough electrical engineer of Huddersfield at which city the meetings were held. The proceedings concluded with the usual business meeting on June 23.

After the delivery of the presidential address, in the course of which Mr. Mountain covered many topics, technical and administrative, engineering and financial, in connection with the conduct of municipal electric lighting and tramway undertakings, papers were read as follows:

Alderman W. Potter, of Taunton, and Mr. H. C. Bishop of Wigan, on "Means for Stimulating the Demand for Electricity."

Mr. C. S. Vesey Brown on "Electricity Supply for Small Towns."

Mr. G. M. Harris on "The Lighting of Small Towns."

Mr. T. P. Wilmshurst on "Power Supply by Single-Phase Motors."

Mr. C. A. L. Prussman on "Notes on the Maintenance of Motors on Hire from an Electricity Works."

Mr. R. C. Quin on "Combined Management of Tramway and Lighting Departments."

Mr. H. L. P. Boot on "Methods of Reducing Light Load Losses."

Mr. L. Andrews on "The Distribution of Electricity to Scattered Areas."

M. G. Wilkinson on "Distribution of Electricity."

Mr. C. H. Wordingham on "The Maintenance of Certain Portions of Distributing Systems at Earth Potential."

Mr. A. E. LeRossignol of Newcastle on "Impressions of Present American Tramway Practice."

Mr. R. C. Quin of Blackpool on "Protection of Telegraph and Telephone Wires."

The, customary luncheons and visits to electrical works in the neighborhood of Huddersfield and Leeds formed part of the proceedings.

The Central London Railway.

London's third deep-level electric line was publicly inaugurated June 27. His Royal Highness the Prince of Wales performed the ceremony. Third rail, twin tunnels, 13½ miles of 4 feet 8½ inches track, generation at 5,000 volts three phase at Shepherd's Bush station, transformed to 500 volts line current. There are four sub-stations at suitable points. Thirty-two locomotives and 170 carriages (seven per train) comprise the rolling stock. In the power station there are 16 Babcock water-tube boilers 6 Reynolds Corliss horizontal compound condensing engines, and six three-phase alternators of 5,100 kw. total capacity. Sprague electric lifts are to be employed at the several stations between the city and Shepherd's Bush.

Professor Lodge.

Dr. Oliver Lodge, F. R. S., who has for some years been principal of the University College, Liverpool, has now been appointed by the Board of Education to the principalship of the Birmingham University.

ELECTRICALLY OPERATED RAILWAY TURNTABLE.

BY FRANK C. PERKINS.

The ease with which steam operated railway turntables may be converted into electric turntables may be seen from the accompanying illustrations. There is no question but that electric power has every advantage as steam for this purpose, as small portable engines and boilers are far from economical and require more constant attention. The electric turntables may be equipped with either alternating or direct current motors and are easily supplied with current from either the lighting or power circuits from the power house. The turntable is easily manipulated from the small building shown in Fig. 1, and the simplicity and ease with which its operations may be manipulated make it far superior to the steam operated turntable. The illustrations, Figs. 2 and 3, show the Westinghouse turntable "donkey" which consists of a 10 hp. series reversible motor and is mounted upon a heavy cast-iron frame which moves in the turntable pit. The entire motive power weighing less than two tons. The electric turntable when loaded with a ton wheel locomotive weighing 200,000 lbs. makes a complete revolution in about ½ minute. It is claimed by the manufacturers that there is an enormous saving in using the electric round house table over those operated by push poles or even portable steam engines and boilers.

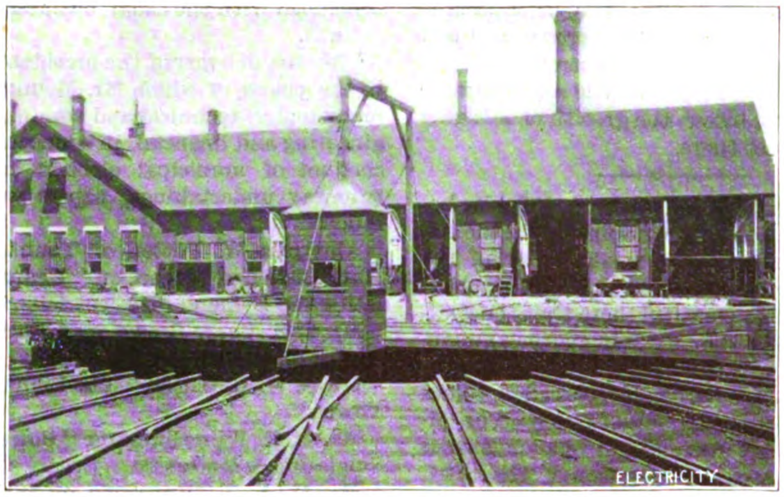

Fig. 1.—An Electrically-Operated Turntable.

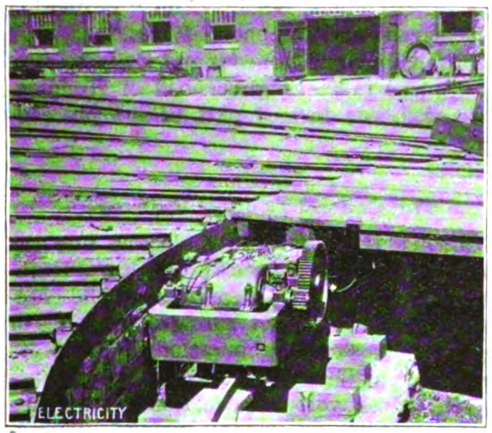

Fig. 2.—Dust-Proof Turntable Motor.

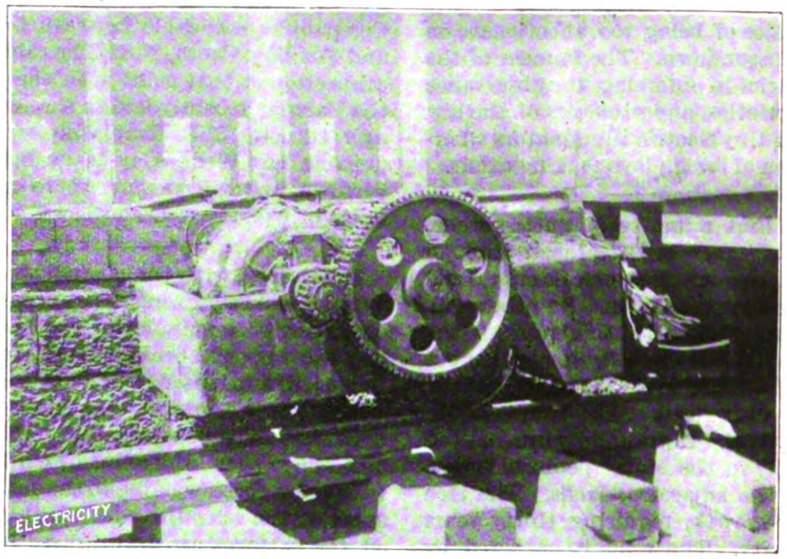

Fig. 3.—Electric Turntable Motor.

The Washington monument is hereafter to be operated by electricity. It costs the Government at present about $20,000 a year to take the public up the 500 feet to the top and down again.

HOT-WATER HEATING FROM A CENTRAL STATION.*

BY H. T. YARYAN.

It does not require the eye of a prophet to foresee the future means of heating and lighting our cities. If heat, using water as a vehicle, can be distributed from a central station covering a territory measured by a radius of 1½ miles from the station, and do it with profit to the investors and entire satisfaction to the consumers, the problem would seem to have been solved. This has been done by the Toledo Heating and Lighting Company for the past 5 years a period sufficiently long enough to place the enterprise beyond the experimental stage, and entitles it to be classed as a successful business venture. It is because I believe the members of this society will in the future be called upon to exercise their skill and knowledge in refining and perfecting the system that I lay the facts and "state of the art" before you, giving freely results of my own experience, in the hope that it will be of assistance when you are called upon for advice.

I think that it will be found that when the new system is generally introduced in connection with the production of electricity, you will be forced to modify your views on high-pressure steam and the compounding of engines. Where steam economies are of little avail seven months out of the twelve, and where seven months cover four-fifths of the electrical output for the year, there would seem to be little encouragement for heavy outlay in that direction. Fortunately for the system the demands for heat and electricity run almost on parallel lines a large portion of the year. Under the new system electricity becomes a by-product, the only cost of fuel being the condensation of engines, which will average probably 20 per cent. Experience has shown that for every dwelling house heated it requires the exhaust from engines necessary to light four. It therefore follows that the lighting district must be extended beyond the heating, or some other use be found for the output, such as street railroads, if the entire city is to be heated. If some great genius, like an Edison or a Tesla, were to announce to this society that electricity could be produced without cost, I imagine there would be a sensation; and yet the Toledo Heating and Lighting Company is doing this very thing, as the six months' business ending January 1, last, shows, the load being 199 houses heated and 450 lighted:

Receipts from heating		$9,900.88
Receipts from lighting		9,064.78
Fuel	$5,040.63	
Wages and salary	2,827.14	
Expenses—taxes, repairs, oil waste, etc.	1,896.77	
	$9,764.54	

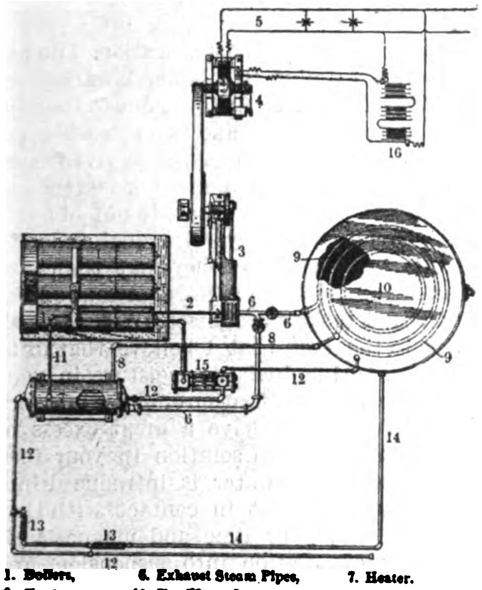
I presume the question will be asked why electricity should be treated as a by-product instead of the heat. My answer is that charges for heat can be fixed and maintained, the consumption of coal increasing proportionately with the number of consumers while the opposite is true of electricity, and a flexible scale of charges is necessary if the large excess of output is to be disposed of.

Most of you will recollect the disastrous failure in Boston about 12 years ago, in an attempt to distribute hot water from a central station. A large sum was invested, and the work of installation was of the highest order. I have no direct information as to the causes of this failure, but it is not hard to figure out if one reads the paper of Chief Engineer Abbot before the Boston Society of Civil Engineers. The two mains laid were 4 inches for outflow of hot water and 6 inches for return. The proposition was to heat water to a temperature of 400 degrees F., and to circulate, necessarily, under a pressure of 250 pounds. He says, in his paper, that the maximum rate of circula-

* Paper read before the American Society of Mechanical Engineers, Cincinnati, May, 1900.

Digitized by Google

tion would be from 10 to 15 feet per second. If I can figure friction, and making a liberal allowance for the less viscosity of hot-water, there would be lost in pressure from 3½ to 8 pounds per 100 feet, or at the end of a pipe 3,000 feet from station, from 100 to 240 pounds. The effect of this on superheated water would be to convert a large portion of it into steam, and the small service pipes, of ½ to ¾-inch, to the various houses would not deliver a sufficiency of the mixed steam and water to heat the buildings. Other troubles would follow in the return pipe. The theory was that when the pressure was reduced inside the buildings, the superheated water would give up a large percentage of steam, and this was to be used for heating; the water returning to the station by gravity, in a closed circuit, to be again superheated. Unfortunately superheated water will give up its steam inversely as the pressure, and as the pressure must be greater at the extreme end of the line than at the station, it follows that as the return flow reaches points of lower pressure, steam will again be formed until the pumps reach their capacity for handling the mixed volume of steam and water, when circulation would slow down and practically cease. There are many other troubles which they must have encountered that I could mention, but the one given is sufficient, as it was inherent and fatal to the working of such a system. The surprise is, not that the experiment was a failure, but that intelligent engineers should have given their sanction to such an undertaking.



1. Boilers, 6. Exhaust Steam Pipes, 7. Heater.
2. Engine, 10. Hot Water Storage, 9. Heating Coil
4. Dynamo, 15. Circulating Pump, 16. Storage Battery.

FIG. 1.—PLAN OF HOT-WATER HEATING SYSTEM.

The system I am about to describe and show in plan (Fig. 1) is so simple that but few words are necessary to make it intelligible. The steam boilers, engines and dynamos are such as may be used in the ordinary electric light station. Heaters of the tubular type through which the water passes from the pumps to the mains receive the exhaust steam from the engines, heating the water to any desired temperature. When more exhaust is being produced than is required to heat the water, the excess is delivered to a water storage tank to be used later when the output of electricity is small. The circulating system consists of two wrought-iron pipes, laid side by side in the ground, carefully protected by insulation, one pipe for the outflow of hot water impelled by the pumps, the other for the return water from the coils in the various houses heated, going back to the suction end of the pumps, to be forced again through the heaters, where the loss of temperature is restored.

The Toledo Heating and Lighting Company has two stations, known as the Floyd street and Twenty-second street stations, and although the heating mains of the two stations are separate and distinct, the dynamos of the two stations feed into a common system of electric mains. The length of the double water mains, that is, ditch, connected to the Floyd street station is 8,550 feet, and the number of houses heated is 101. The length of mains from Twenty-second street station is 8,260 feet, and the number of houses heated is 98. The amount of radiating surface connected with the Floyd street station is about 9,000 square feet, and with the Twenty-second street station about 85,000 square feet.

The amount of coal consumed at both stations during the heating season, from October 1 to May 1, averages 5,000 short tons of coarse slack, or about 25 tons to the residence. These same buildings, if heated by their own furnaces, would average not more than 18 tons of hard coal each. The difference may be accounted for by the loss of heat in ground radiation, and largely by the fact that we heat the buildings more thoroughly and for a greater number of hours than they could or would do by private furnaces. The loss of heat through radiation in our mains is an important one, and I am sorry not to be able to give positive data, and it is impossible to more than approximate the loss. From careful observation I estimate the loss to be between 15 and 20 per cent. The water reaches the extreme end of our lines, three-quarters of a mile from the station, in the coldest weather, with a loss of 12 degrees F., which would be an average of 6 degrees to all of the houses. As the water returns to the station with a drop of 35 degrees, this would indicate about 17 per cent. loss in the ground, which I believe to be nearly correct. A pressure of 60 pounds is maintained on the feed line during cold weather and 40 pounds during moderate weather. The service pipes to the various houses are 1-inch pipe, and the return line throttled with a disk inside the building, the size of opening depending upon the quantity of radiation, but averaging ¾ inch. The houses are equipped with radiation sufficient to heat them to a temperature of 70 degrees F., with water entering the house at 160 degrees F., when the outside temperature is freezing. By raising or lowering the temperature of water 1 degree for each degree of variation in the outside temperature we are able to maintain a constant temperature in the houses during all kinds of weather. There is no occasion for the consumer to regulate the flow of water during the entire winter, and with few exceptions, our consumers open the supply valves in the fall and only close them in the spring. The extreme limits of temperature of water are from 130 degrees in moderate weather to 212 degrees in the coldest.

The insulation used is shown in section (Fig. 2), and is both effective and inexpensive. The top, bottom and sides are made in separate sections by using for top and bottom three 1-inch boards, separated with ¼-inch strips to form air spaces, with 1-inch by 4-inch boards on the sides to prevent the entrance of earth. This manner of insulation is as nearly perfect as can be hoped for, and the only improvement which might be suggested is to creosote the outside boards. After four years of use the only sign of rotting is in the outside boards which come in contact with the earth. The heat in the mains keeps all other boards perfectly dry, and it would seem that their life was indefinite. The mains are laid in a ditch only 30 inches deep, as we have found by experience that the nearer they are to the surface of ground the less the loss by radiation. The reason for this is simple enough, as wet ground is a better conductor of heat than dry, and the deeper you go the longer the ground remains wet.

The heaters are really surface condensers, and I have some hundreds in use for this purpose, the only novelty about them being the manner of providing for the difference in expansion of copper tubes and iron shell. No thimbles or other devices are used to permit a slip through flue sheets, but each tube is rigidly expanded in the top and bottom flue sheet.

They are 7 feet long, 24 inches in diameter and contain 500 ⅝-inch copper tubes. The tube, before entering, is bent so as to make a permanent sag of ⅛-inch, which is intensified to about ¾-inch in expanding, by the use of a drift.

As all the water of condensation is sent back to the boilers, a thorough separation of oil is necessary. I have found most of the so-called traps a delusion, as they depend upon slowing down the steam current to permit the particles of oil to be dropped. The finer particles, however, are so thoroughly entrained that they are carried to the condensers and thence to the boilers. The trap was really constructed to separate entrained salt water, in distillers on ship boilers under a vacuum, where the speed of vapor is high. The principle involves separating the volume of vapor into jets by passing through 1-inch tubes equal in area to the exhaust pipe, so that only a narrow space intervenes between the end of the tube and impinging surface. The smallest particle of entrained substance is carried over this space by its own momentum and is held by the impinging surface, where it runs off through the drain pipe. Incidentally I may state that fully one-half of the oil used on engines and pumps is recovered and used over again.

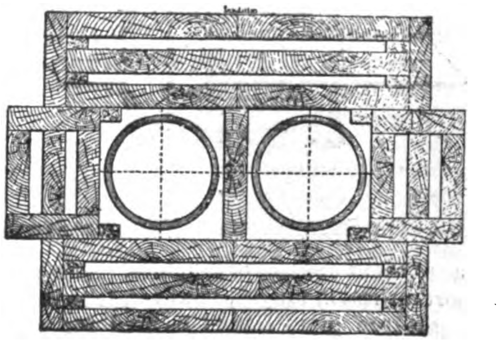


FIG. 2.—SECTION OF PIPE INSULATION.

The provision for expansion on underground mains is of vital importance. After trying all manner of devices the ordinary U, where the run is straight, and 90-degree bends at corners, answers the purpose admirably and gives no trouble whatever. The U's are placed about 600 feet apart, and as the extreme expansion is about ¾-inch to 100 feet, only 4½ inches are necessary to be taken care of by each U. As the mains are laid cold we put an extra strain when laying on the U's in an opposite direction

Digitized by Google

to that in which they work when allowing for expansion.

Almost the first question asked by a practical engineer is, how about the corrosion of your pipes? I am happy to say that I can answer this question in a satisfactory manner, as over 10,000 feet of pipe were relaid last summer after being in use five years. The wrought-iron pipe showed no signs whatever of corrosion, but steel pipe was perceptibly affected. There was a great difference in different lengths of steel pipe, but all was affected more or less. The appearance of the pipe showed the forms of nodules on the inside, varying in number from one dozen to 100 in a length of pipe, and in size from a grain of corn to a hazel nut. When the nodules were removed a soft under-layer of carbon remained, and with the finger-nail this could be removed, developing a perfectly round pit from $\frac{1}{4}$ to $\frac{3}{16}$-inch deep, but in no instance had the pit perforated the pipe. As a matter of curiosity, some steel pipe which had been in use two years was examined and found to be in exactly the same condition as that of five year's use. The action seems to be electrolytic, some particle of impurity forming the nucleus for decomposition of the steel. If any inference can be drawn from the facts stated, it is that the impurity has lost its power to cause electrolysis after being surrounded

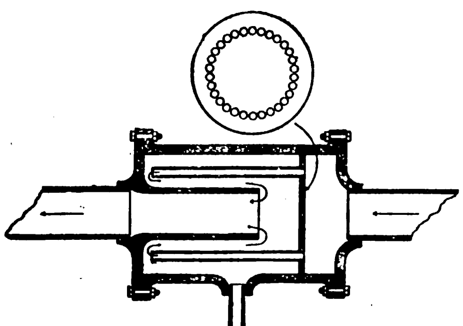

FIG. 3.—OIL SEPARATOR FOR EXHAUST STEAM.

by a sufficient amount of graphite. The most important lesson taught, however, is that only wrought-iron pipes should be used for water circulation.

A test with pressure gauge on the outflow pipe at the extreme end of our lines shows 39 pounds with 60 pounds at the station, or a loss of 21 pounds due to friction. At the same time the pressure on the return line was 28 pounds, and as the friction should be the same on both lines, the difference may be accounted for by the fact that the return line discharges into a tank 15 feet high at the station.

In calculating the size of mains for a given number of houses it became necessary to know the relative friction of hot water as compared with cold. To my surprise I was unable to find any data that were of value, and to settle the question I made some tests which may be useful in future work. A run of 450 feet of 1-inch wrought-iron pipe with numerous bends was connected to a heater, and the water passed through a meter. With a constant pressure of 10 pounds the following cubic feet of water were delivered at the open end of the line in 5 minutes:

At 34	degrees	F.	6.2
" 60	"	"	6.3
" 90	"	"	6.4
" 120	"	"	6.5
" 150	"	"	6.6
" 185	"	"	6.75
" 212	"	"	7.9

As it requires an average of 15 gallons per minute to be delivered at each house, and knowing the friction of cold water, the data thus obtained enabled me to calculate the size of mains necessary to give good service to each house and to always maintain a sufficient difference in pressure between feed and return mains to insure rapid circulation.

As exhaust steam heating from central stations has been introduced to a limited extent, it may not be out of place to call attention to the objections to steam, which do not apply to hot water.

1. The exhaust not being uniform in power plants throughout the entire period of 24 hours, either live steam must be used during the minimum load or exhaust must be lost during the maximum load.

2. The excessive cost of laying steam mains, which must be large and thoroughly protected from infiltration of water. The temperature of pipes being above the boiling point of water, any infiltration is converted into steam, and thus a vast amount of heat is dissipated.

3. It is absolutely necessary that from 5 to 15 pounds back pressure shall be carried on the engine, which is exceedingly wasteful.

4. The condensation of steam is wasted and with it a large percentage of heat.

5. The piping of houses is expensive on account of the large size required to convey steam with 1 or 2 pounds back pressure.

6. The service is not satisfactory on account of difficulty in regulation, especially in mild weather.

7. The offensive smell due to vents and leaky stuffing boxes.

8. Water hammer due to condensation in house pipes.

9. The quality of heat, especially where direct radiation is used.

10. Danger from fire, which has been abundantly demonstrated, can rise from long continued contact of steam pipes with wood in an enclosed place.

11. Greater loss by radiation in ground, due to an average higher temperature of mains.

12. The necessity for sewer connections to remove condensation in mains where traps may form.

13. The rapid destruction of all iron drips, due to the solvent action of distilled water.

14. The filling of the entire system with air when a shut-down occurs for any length of time.

The only counter-charge I have ever heard made was that it required live steam to run the pumps. But this is largely offset by the back pressure on engines in the steam system, and can be made a large source of profit by selling the heat, as none is wasted.

During the past two years the system I have described has been installed and is now in successful operation in the following cities and towns: La Porte, Ind.; Mattoon, Ill.; La Crosse, Wis.; Kenosha, Wis.; Alton, Ill.; Portage, Wis.; Boone, Perry, Ida Grove, Iowa Falls and Mason City, Ia.

During the present summer the company which I represent will install a refrigerating plant for domestic use, distributing cold brine in exactly the same manner that we do hot water, but using a separate set of mains. We shall use an ammonia absorption machine, operated with exhaust steam so that as the demand for heat ceases that for cooling purposes begins, thus utilizing the exhaust steam from our engines during the summer months, which now goes to waste.

WET STEAM.*

BY WILLIAM H. EDGAR.

I am here at the request of your worthy Secretary, and I really did not know what to take as a subject, and in an off-hand manner I gave him the title "Wet Steam." Now wet steam, of course, you are more familiar with than I am. It is produced from two different causes in the boiler, one is priming and the other foaming. Priming I have nothing to do with that comes under mechanical defects and belongs to the engineering profession. Priming is due, as you well know, to the lack of delivery surface or lack of steam space and to the mechanical construction of the steam dome, and especially the connections between the different domes in water tube boilers. But wherever such a mechanical defect might exist, the water you might say would spatter the steam if your boiler water contained salts of soda.

Foaming is caused by saponification. I do not believe that foaming in a boiler is caused by mud or dirty water. I think it is due to the soda contained in the water, and as a rule wherever you have a river, that is to say, using river water containing mud, you have more or less soda in the form not only of a carbonate but of a sulphate. You are probably well acquainted with well waters and the tendency that they have to foam after running a week or two; and the reason that I took as a subject "Wet Steam" was due to the fact that I believe that in 90 cases out of a hundred the moisture in your steam is due to saponification or to the presence of soda. You might have a great excess of lime and magnesia in solution in your feed water, but when the water is introduced into the boiler and brought in contact with that degree of heat, your lime and magnesia is thrown out of solution into suspension, and consequently you get no action whatever in the way of foaming. It does not increase the density of the water. It is not a part of the water. It is not in solution. Soda always remains in solution. Ninty per cent of the waters throughout the country used in the boilers contain considerable lime and also some soda, and nine plants out of ten are treated in one way or another with some one or the other salts of soda, and you get the same action in all such cases that you receive from the use of artesian well water and suface well water in certain places where the soil contains sulphate of soda and generally the carbonates.

Now what I wanted to refer to was the fact that you all know that it is essential to get as dry steam as possible, and if you could get absolutely dry steam, you could use a straight mineral cylinder oil without requiring the admixture of any animal oil whatever. The animal oil is necessary only to take care of the water. The condensation washes off the mineral oil, necessitating the compounding with an animal oil to hold it, to give it the clinging, adhesive, film-cutting properties of a good cylinder oil.

On the Burlington road they condemned the oil and sent it back repeatedly month after month just during the last couple of years—in fact the last year—and could not buy anywhere else except of one company, and they had considerable difficulty in getting an oil to meet their requirements. They finally reached about 35 per cent. of tallow in the compounding

*Paper read at the Northwestern Electrical Association Convention, Waupaca, Wis., June 26-28, 1900.

Digitized by Google

They were using soda ash in the boilers, and the more soda ash they used the more moisture they had in their steam, the more they saponified the water and the more moisture was carried over and with this moisture came soda, and the more soda that came over the more it cut the animal oil, saponifying it, forming soap, and they had considerable difficulty before they found out really where the trouble lay.

I believe that throughout the country in different plants a great many good cylinder oils have been repeatedly condemned and all due to the well water used carrying the water a little too high in the boiler, or using some preparation of soda, and of course the higher you carried the water, and the more you agitated the water from a sudden opening, I suppose, of the valve in the delivery of steam, the more readily it would foam, and I believe that in all your practice in the engine room, that if you would watch your water level and the nature of your water, so as to know the amount of soda it might contain, it would enable you to better take care of the oil question.

Caustic soda in a saturated solution would contain 59 per cent. of caustic soda; a saturated solution of soda ash would contain 40 per cent. soda ash, when it would begin to cake; with salt you would have a 35½ per cent. saturated solution before it would cake. All sodium salts remain in solution until the solution is saturated, and then they cake and always cake at the hottest part of the boilers. It is quite common in Kansas and down in New Orleans and out in the Hawaiian Islands and along the seacoast where they use salty water to buckle the tubes and bag their sheets, due to salt.

So I brought this question up and state that I believe that nine-tenths of the wet steam and cases of foaming are due to soda.

DISCUSSION.

Mr. McMaster—What is the best easily applied test to determine whether there is an excess of soda or not?

Mr. Edgar—An analysis of your feed water is about the only course you can pursue. You can have that done at any State university. If you were running a condensing plant on the seacoast, using salt water and had trouble in your boilers, you would look for leaky condensers. I found out in San Francisco that they were testing by taste. They let it go until they could taste the salt. I rigged up an apparatus where they could titrate and determine the salt. Their natural supply showed about four grains of salt to the gallon. When they found it to run six, eight or ten per cent. they looked for a leaky condenser.

Mr. Copeland—Wouldn't the easiest way to find this be to examine the inside of your boiler when you clean it? If there is considerable scale, you have considerable soda, haven't you? And if there is no salt you haven't any.

Mr. Edgar—No, the scale would really give you no indication of the amount of soda.

Mr. Copeland—All that we purge a boiler for is to do away with the scale, isn't it? If your flues do not scale, you are about as near perfect as you can be, are you not?

Mr. Edgar—Oh, yes, but I was referring not to the purgers, but to the natural conditions from the use of well waters.

Mr. Copeland—Wouldn't that be a good way to find out whether you have good water or not, that is, for us country fellows that do not know anything about the technical practice of the thing?

Mr. Edgar—Oh, yes, if you are not getting into trouble and have dry steam.

Mr. Copeland—It is pretty hard to get dry steam.

Mr. Edgar—Yes.

Mr. Copeland—I have a separator in my main steam pipe, and the amount of water that comes out of it is astonishing. What makes the condensation I don't know, but it will empty several gallons every 10 or 15 minutes.

Mr. Edgar—A great deal of that depends upon the boiler and its construction. Take the large horse-power units to-day in use in water tube boilers, and when you are running up to full capacity, your steam is practically in your fire, and when you draw on that boiler suddenly, there must necessarily be quite an agitation, and you have a very small delivery surface, and in some of the water tube boilers I would say, although I am not an engineer, that some of the connections are decidedly wrong.

Mr. William H. Schott of Chicago—Is it not a fact that this is usually caused by carrying the water too high?

Mr. Edgar—Yes.

Mr. Schott—In ninety per cent. of the cases?

Mr. Edgar—Yes, sir. It is a fault of firemen throughout the country to carry the water too high. In a Sterling boiler you ought to carry the water as low as possible on account of the back drum and steam delivery.

Mr. Copeland—How much water would you carry on top of your tubes in a horizontal boiler?

Mr. Schott—Three inches on the front end; and if the boiler is set properly, it should be about one inch or an inch and a half lower in the back end.

Mr. Edgar—What water have you been using?

Mr. Schott—Michigan Lake.

Mr. Edgar—That is an exceptionally good water.

Mr. Schott—Yes, sir, it will average about 20 grains to the gallon.

Mr. Edgar—Lake Michigan is a lime water and a lime water will not foam.

Mr. Copeland—We use lime water out of the river but it gets to foaming once in a while.

Mr. Edgar—It will show up some soda too.

Mr. Schott—If you use soda ash as a purgent you will get violent foaming.

Mr. Edgar—I wish to say in addition to what I touched upon that oil coming back in the return condensation and causing considerable trouble, making the flues leak, buckling a tube or bagging a sheet, is quite common in the condensing plants of to-day.

Mr. Copeland—How will you get oil back in there?

Mr. Edgar—In your return condensation. They have tried it in a great many cases, and there are cases where they use all their condensation back in the boilers.

Mr. Schott—To what kind of condensers are you referring?

Mr. Edgar—I am referring to a condensing plant where they turn all their condensation back into the feed water supply.

Mr. Schott—That can be done with a Wheeler surface condenser.

Mr. Copeland—I use a jet condenser.

Mr. Edgar—They have a great many times introduced soda ash and caustic soda with the object of cutting the oil, and have saponified it. In the first place they had an insoluble soap as a result of the action of the olic acid, forming oxide of lime, and they have used soda to cut that, and it forms a soluble soap which saponifies the water, causing violent foaming.

WIRELESS TELEGRAPHY APPARATUS TO PREVENT THE INTERCEPTION OF MESSAGES.*

BY D. TOMMASI.

It is well known that wireless telegraphy is inconvenient on account of the publicity of its dispatches, due to the fact that any receiving apparatus placed within the zone of electric influence emanating from the transmitting instrument may be operated by the latter, and the telegraph messages thus intercepted.

The apparatus invented by the writer preserves the secrecy, by preventing the message from being deciphered by a receiving instrument placed at an intermediate point.

The invention is based on the principle that the electric undulations may be varied, according to the adjustment of the two metal spheres forming the spark gap in the oscillator, as they are more or less distant from each other.

It follows that in suitably varying the space which separates these two spheres, that is to say, by increasing or diminishing the length of the oscillators' spark gap, we may regulate quite accurately the distances to which the electric waves may extend to reach a receiving station.

Essentially the invention consists in combining the transmitter of the aerial line, which we designate by A, with a second transmitter A', which an operator manipulates in an indeterminate manner to generate long and short impulses, which mingle with the impulses from the transmitter A. These electric waves are so regulated as to produce an active zone from the transmitter A', which will extend to a distance somewhat less than that to which the oscillator of the transmitter A has been regulated.

Under these conditions the electric waves sent out by the transmitter, A and A,' are mingled in such a manner that any receiving apparatus placed within the reach of transmitter A' could receive only a meaningless mixture of dots and dashes from which it would be impossible to make out the signals sent from the transmitter A.

Thus it becomes possible to interpret the signals from the transmitter A, only by an instrument placed beyond the range of transmitter A'.

Security will become greater as the active zone from transmitter A' approaches the active zone emanating from transmitter A. Finally to obtain additional security by this system of wireless telegraphy, we may combine with transmitter A several transmitters similar to A', as A'', A''', etc., each regulated for varying distances, as the drawings set forth. The whole of the telegraphic apparatus consists of a station transmitter A, and a station receiver B. The station A contains an induction coil A in the primary circuit, in which is intercalated the interrupter B and the key C, while the secondary circuit is connected to the oscillator D, which is in circuit with the earth and the mast e.

The station A contains in addition a secondary transmitting apparatus A', composed of the same essential parts as the first, that is, it contains an induction coil A', with interrupter B', an operating key C' and an oscillator D', connected like the preceding to the mast C.

In the second transmitting apparatus the sending key C' is operated in any indiscriminate way, either by hand or by mechanical

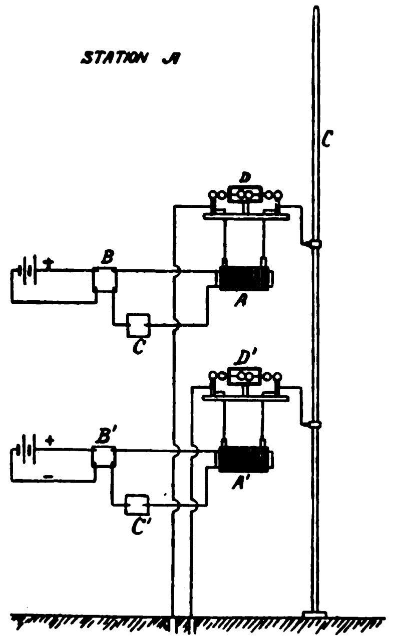
* Translated from "La Vie Scientifique," Paris, for ELECTRICITY.

Digitized by Google

means, and in such a way as to send out short and long signals which will confuse the signals sent out by key C.

The key of the second apparatus A', might also be kept open during the whole time that the message is being sent from the true transmitter A, and by so doing, any receiver which is within the active zone of the second transmitter A', would register only a plain continuous line.

The separation of the oscillator balls D, is regulated to such a distance that the electric waves sent out by this apparatus reach the re-



ceiving station B; but on the contrary the separation of the similar parts in oscillator D' are so determined that the electric oscillations of the latter instrument are slightly weaker than those generated in the true transmitter A.

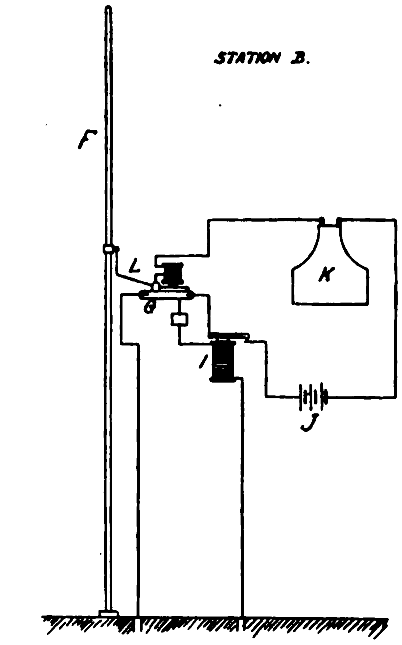
Under these conditions, any receiver placed in the electric radius of the second transmitter cannot receive, for as before mentioned, only a series of meaningless dots and dashes would be noted, among which are the signals of the real transmitter A.

The receiving station contains the usual apparatus, a receiving mast F, the counterpart of the mast E, connected to a coherer G, having one terminal connected to earth and the other connected in circuit with a battery and a polarized relay I connected to earth; the polarized relay I is operated when the coherer G becomes a conductor through the influence of the electric waves by closing the circuit of the local battery J, which operates a receiving register K, and the electric decoherer L, which is used to immediately restore the coherer to its usual resistance.

A New Illuminant.

(From our Ottawa Correspondent.)

A new illuminant and heat producer has just been introduced upon the Ottawa market. The gas is manufactured by a plant simple in device, and ordinary air furnishes the chief source of supply. A motor is arranged which revolves a wheel operating a fan, which in turn drives a constant current of air through a pipe connected with an acid chamber. The air passing through this chamber is freed of its carbon and is then passed over carburetors. The latter consists of a series of tubes bearing wicks, which are kept saturated with a fluid supplied by a near by generator. The air thus perfumed with this liquid passes into a gasometer from which it is supplied to the lights much as is ordinary gas. As the gas passes off to the lights the gasometer, which is suspended in a jacket containing water, then descends, but when it reaches a certain point connection is made with the motor which is thus put in operation, producing a current of air which, after treatment, passes into the gasometer causing it to fill and rise up again. The inventor of this illuminant, who is an American, claims for it a score of advantages over other illuminants. It is cheap,



the cost for a 50-candle power light being only a quarter of a cent per hour. The gas is said to be 93 per cent. atmosphere, is non-poisonous, non-explosive and odorless, manufactured by a plant of simple construction, easy and clean to manage, which, being automatic, only requires little attention. The light is similar to solar rays, inasmuch as all colors are seen in their natural shades when viewed in it. Captain Foxell of Philadelphia, Pa., has introduced the illuminant in Canada, and has associated with him in Ottawa Mr. J. R. Booth, the millionaire lumberman, and Mr. J. A. Seybold, in whose dry goods warehouse the plant is now installed and in operation.

A PATENT ELECTRIC SMELTER.*

BY F. E. HATCH.

My process is one of roasting, burning, or smelting by electric heat. I multiply my heat 42 times over what it is in the ordinary form of furnace.

First—I have seven revolving sections which are heated with the same power as is required to heat one section in the ordinary form.

Second—The arrangement of the carbons in my smelter is such that the same heating surface is obtained with one-half the carbon, and a consequent saving of one-half the power.

Third—In my smelter you absorb the heat from the three lower sections, whereas the current is only fed upon one section, which multiplies my heating effect by three.

The total amount of energy required to generate a certain number of heat units is as follows:

To heat 25 cubic feet 1,000 degrees require 40 kilowatts; 1,200 degrees, 45 kilowatts; 1,500 degrees, 50; 2,000 degrees, 58; 3,000, 66; and 3,500, 70.

An ordinary blast furnace in treating iron requires two tons of coal to treat one ton of ore. Here we use 70 kilowatts of current. Figuring your kilowatts at 5 pounds of coal per kilowatt hour, it only makes 350 pounds of coal compared with two tons on the blast furnace principle.

Furthermore the cost to install a hundred-ton furnace on the blast furnace principle would be from $100,000 to $145,000, while we can install our furnace for $40,000, with a saving of over 50 per cent. in the operating expense.

I show you a carbon that has stood 25 hours' run, and also a new carbon with which to compare it. Only a fraction of a hair in thickness is worn off the used carbon. I make my connection by screwing a copper bolt directly into the carbon. Seven sections of the carbons are placed in the furnace and set in a ring. The ore covers the three bottom sections. The furnace revolves at the rate of half a revolution a minute. We fill in the center and tap it at the bottom. In treating bessemer ore we close our furnace air tight, and raise the temperature to flux. After the ore fluxes we draw off the slag, and then we have the iron in the shape of cast pig. If we wish to puddle it into steel, we do it without removing the ore, simply by increasing the speed and increasing the temperature about 200°, and having a rapid flow over these carbons at a higher temperature, which works the water out and puddles it into steel. Then we can tap it into steel pig. But if we desire we can drop the electric current into a lower heat, to 400° below the melting point of steel, lower the speed to one-half a revolution per minute, and that gathers it into a bullion, catch it with the tongs and it is ready for the rollers.

Thus we do three processes in one and get 45 times the amount of heat.

The furnace that I have built handles a ton an hour. This is the only furnace we have in operation. It is an experimental furnace, but it is very successful.

DISCUSSION.

Mr. Bean—What voltage do you use?

Mr. Hatch—Ten volts secondary, alternating current We can locate our furnaces right at the mine and do our smelting there and save freight and cartage, shipping the bullion instead of the ore.

Mr. Debell—I take it that the process is peculiarly valuable in smelting ores.

Mr. Hatch — Smelting ore, burning iron, burning cement and roasting ores

Mr. Debell—Then it would be of no value to any electric central station except they had some industry of that kind in their near neighborhood. Is not the equipment of that system rather expensive for any ordinary blast furnace or lime-burning concern?

Mr. Hatch—No, sir; it is far less.

Mr. Debell—I thought probably it was intended for ores mostly that are turned out in very large quantities and that the investment would be justified for such a purpose as you have stated. But would it be justified for small concerns, blast furnaces or lime kilns or anything of that kind?

Mr. Higgins—Could you not use it to generate steam?

Mr. Hatch—It is not intended for that purpose.

THE LIGHTING OF SMALL TOWNS.*

BY G. M. HARRIS,
Electrical Engineer, Bray, Ireland.

The lighting of small towns is a problem requiring very careful consideration, not by reason of any engineering difficulties, but by reason of the difficulty of making such an undertaking pay.

On account of the profits being necessarily small, the lighting of small towns will continue to receive little attention from private companies, except they be very plucky ones. The matter will therefore be left for the consideration of the local authority, who will be content, or at all events should be, if at a reasonable cost they are enabled to carry out the public lighting of the town, and at the same time place a supply of electricity at the disposal of its inhabitants.

The measure of the success of such an undertaking should then be judged, not by actual return made in the shape of profit shown, but upon truly municipal lines, i.e., by the efficiency and cost of the public lighting and the rate at which a supply of electricity is obtainable for private use.

Small towns mean small consumers and usually a scattered area.

The distributing charges will be heavy, so that if there is to be any hope of success the generating charges must be light, which means that the site for a generating station must have very special natural advantages, such as good water power or facilities for cheap fuel, or a combination of the two.

Where there are no such advantages there appears to be no alternative but to wait for the great power companies to pick up such small areas as may be within their reach or upon the direct line of route of their mains to larger ones.

Assuming that the conditions are favorable for generating or obtaining a supply at a low cost—at the commencement the public lighting should be provided for and taken over, and provision only made for private consumers where such are certain to come on in a reasonable time.

The policy of laying the mains for private use well in advance of the demand, though justified in wealthy areas, would not be so in small towns where the conditions are different.

The prospect of profit in supplying small and scattered consumers being very small, there is no room for speculation, and it is of the utmost importance that the capital expenditure be kept as low as possible, and that no capital should be unproductive.

It therefore follows that the system of distribution should possess the maximum of flexibility at the minimum of cost.

Now that distribution up to 200 volts has been successfully established, there are of course many towns where direct current would be feasible and no doubt preferable, but in the majority of cases high pressure alternating current with transformers in street pits and occasionally in houses would be better; where the area comprises a number of private houses and mansions standing in their own grounds and of necessity widely scattered but nevertheless desirable to reach, the alternating system is the only one commercially possible. This question, however, will of course be governed by the circumstances in any particular district, but the question of the actual cost of mains will always remain—a serious item telling against economical distribution on a small scale.

It is therefore the object of this paper to deal with the matter of cheap mains and main laying, that being, I consider, the most important point, the one which lies nearest towards a solution of the problem under consideration.

I therefore propose to bring to the notice of this association two cheap and effective methods of main-laying, of which I have had experience at Bray. First as to the mains in operation at Bray—there have been over six miles of high and 27 miles of low tension laid direct in the ground since 1892, and during that time we have never had a fault on the main line of cables themselves, except where mechanical injury had caused it, and this has very seldom happened. Any trouble we have had has been due to defects in the filling material of the jointing boxes, now overcome, so that this system of laying may claim to have been well tried. In fact, I think the Bray mains are the oldest paper-insulated cables in the Kingdom, other than those from Deptford.

The cables are concentric lead-covered and unarmored. They are taped, but this is, in my opinion, a disadvantage.

In laying, the bottom of the trench was covered with about 3 inches of puddle clay, well wrought, the cables laid in and covered with another 3 inches of puddle clay, evenly put on, and a 7 in. by 1 in. board placed on top, the trench being then filled.

Latterly the timber used for mechanical protection has been larch, being simply the small larch trees, 7 in. thick in the butt, sawn in half; this timber stands well in the ground, requiring no special treatment to preserve it, is cheaper than deal boards and more effective, being thicker. The effect of the puddle clay, impervious to moisture, is to protect the lead covering from any contact with acids or salts in the soil which would attack it, and it has proved so effective that when the cable is now, after eight years, exposed, the lead is absolutely unattacked.

The braiding of the cables has rotted, proving to have been an unnecessary expense. It might prove a source of danger if it allowed a passage of water charged with matter which would attack lead, the life of a lead-covered cable being practically the life of the lead.

As to the jointing, no clips are used; the inners are married and soldered in the usual way, the outer wires are drawn to one side and soldered together forming a loop, all soldering being done well clear of the cable insulation.

The joint is contained in a cast-iron joint box divided longitudinally on the line of two bottle necks for entrance and exit of cable and having on the top side a large hole for filling, (not less than 1 in.) and a smaller hole as air vent, closed by screwed plugs. The cables are served with spun-yarn up to the diameter of the bottle necks and no other packing of the glands is found necessary. The joints having been made and the box screwed up, molten pitch is poured in; the outer side of the bottle necks, beyond the spun-yarn serving, is also filled in with pitch, hollows being formed in the clay for the purpose and here fine clay mixed with the pitch forms a cement which effectually seals up the bottle necks and protects the cable from injury where they enter and leave the box. Such a joint is cheaply made and fulfills every requirement.

It demands only care and requires absolutely no special skill, a very important matter in a small town. This and the fact that it is both electrically and mechanically sound, gives a joint so made, advantages which no form of joint made with clips, that the writer has seen, can claim.

Where any transformer pits lie on the route all cables are brought into the pits and are joined there, inners and outers, with loops of rubber covered single cables. Disconnection of any length of cable for tracing a fault is done by snipping these loops and this works well under our conditions.

Of course in a large scheme where the expense was no object, disconnecting boxes would be preferable, but when used they should certainly be placed in pillars above ground, and so above the reach of flooding, and not in water tight boxes under ground.

As far as the writer is aware the insulation resistance of mains in operation is not easily obtainable. This, however, in no way reflects on the cables; it is partly due to the fact that originally oil was used in the joint boxes but was soon abandoned, not however before the cable ends had suffered, due to water mixing with the oil; the repairing of these ends accounts for the large number of joints. The main cause of the low insulation is due to the large number of joint boxes which still contain a mixture of tar and pitch (the tar having been added as a precaution against cracking of the pitch). This mixture is inferior in every way to the pitch alone which is now always used.

The fact that the resistance from the inner to the outer is in the majority of cases greater than that to the earth is no doubt accounted for at the joints, where the resistance of the pitch has been weakened in the manner indicated, and the surface of the outer is small in comparison to the surrounding box. Their condition, however, causes no anxiety at Bray, as the tests are practically identical with those taken in 1893; the cables have been perfectly steady all along and have lived to see much of the more elaborate and costly draw-in system placed on the scrap heat.

Sufficient has been said perhaps to show that such a system of laying and jointing mains is cheap and reliable, in any case in which no danger from electrolytic action is feared—as where for instance a tram line passed through a town—in such a case the lead would need protection, and recourse to some solid system seems inevitable; but a small town cannot afford the luxury of lead-covered cables laid in this way, and the lead seems to me quite unnecessary, serving no purposes which would not be equally served by any cheap covering which would protect the insulation from damp up to the time of being laid, after which it requires no such protection.

If the cables are concentric the outer insulation can be reduced to that thickness which, with the filling, suffices for the voltage carried; if the cables are not concentric then the covering of each may be reduced to that thickness which, with the filling, is good enough.

The question is, how much the insulation, other than that of the filling compound, may be reduced?

My impression is, that driven by consideration of cost, we shall see this extra insulation year by year reduced in amount till, for low voltage, we come to the bare conductor laid on insulators in the solid filling, and for higher voltage, conductors laid on the same system with very slight extra insulation, relying mainly upon the filling compound.

A PATENT ELECTRIC SMELTER.*

BY F. E. HATCH.

My process is one of roasting, burning, or smelting by electric heat. I multiply my heat 42 times over what it is in the ordinary form of furnace.

First—I have seven revolving sections which are heated with the same power as is required to heat one section in the ordinary form.

Second—The arrangement of the carbons in my smelter is such that the same heating surface is obtained with one-half the carbon, and a consequent saving of one-half the power.

Third—In my smelter you absorb the heat from the three lower sections, whereas the current is only fed upon one section, which multiplies my heating effect by three.

The total amount of energy required to generate a certain number of heat units is as follows:

To heat 25 cubic feet 1,000 degrees require 40 kilowatts; 1,200 degrees, 45 kilowatts; 1,500 degrees, 50; 2,000 degrees, 58; 3,000, 66; and 3,500, 70.

An ordinary blast furnace in treating iron requires two tons of coal to treat one ton of ore. Here we use 70 kilowatts of current. Figuring your kilowatts at 5 pounds of coal per kilowatt hour, it only makes 350 pounds of coal compared with two tons on the blast furnace principle.

Furthermore the cost to install a hundred-ton furnace on the blast furnace principle would be from $100,000 to $145,000, while we can install our furnace for $40,000, with a saving of over 50 per cent. in the operating expense.

I show you a carbon that has stood 25 hours' run, and also a new carbon with which to compare it. Only a fraction of a hair in thickness is worn off the used carbon. I make my connection by screwing a copper bolt directly into the carbon. Seven sections of the carbons are placed in the furnace and set in a ring. The ore covers the three bottom sections. The furnace revolves at the rate of half a revolution a minute. We fill in the center and tap it at the bottom. In treating bessemer ore we close our furnace air tight, and raise the temperature to flux. After the ore fluxes we draw off the slag, and then we have the iron in the shape of cast pig. If we wish to puddle it into steel, we do it without removing the ore, simply by increasing the speed and increasing the temperature about 200°, and having a rapid flow over these carbons at a higher temperature, which works the water out and puddles it into steel. Then we can tap it into steel pig. But if we desire we can drop the electric current into a lower heat, to 400° below the melting point of steel, lower the speed to one-half a revolution per minute, and that gathers it into a bullion, catch it with the tongs and it is ready for the rollers.

Thus we do three processes in one and get 45 times the amount of heat.

The furnace that I have built handles a ton an hour. This is the only furnace we have in operation. It is an experimental furnace, but it is very successful.

Discussion.

Mr. Bean—What voltage do you use?

Mr. Hatch—Ten volts secondary, alternating current We can locate our furnaces right at the mine and do our smelting there and save freight and cartage, shipping the bullion instead of the ore.

Mr. Debell—I take it that the process is peculiarly valuable in smelting ores.

Mr. Hatch — Smelting ore, burning iron, burning cement and roasting ores

Mr. Debell—Then it would be of no value to any electric central station except they had some industry of that kind in their near neighborhood. Is not the equipment of that system rather expensive for any ordinary blast furnace or lime-burning concern?

Mr. Hatch—No, sir; it is far less.

Mr. Debell—I thought probably it was intended for ores mostly that are turned out in very large quantities and that the investment would be justified for such a purpose as you have stated. But would it be justified for small concerns, blast furnaces or lime kilns or anything of that kind?

Mr. Higgins—Could you not use it to generate steam?

Mr. Hatch—It is not intended for that purpose.

THE LIGHTING OF SMALL TOWNS.*

BY G. M. HARRIS,
Electrical Engineer, Bray, Ireland.

The lighting of small towns is a problem requiring very careful consideration, not by reason of any engineering difficulties, but by reason of the difficulty of making such an undertaking pay.

On account of the profits being necessarily small, the lighting of small towns will continue to receive little attention from private companies, except they be very plucky ones. The matter will therefore be left for the consideration of the local authority, who will be content, or at all events should be, if at a reasonable cost they are enabled to carry out the public lighting of the town, and at the same time place a supply of electricity at the disposal of its inhabitants.

The measure of the success of such an undertaking should then be judged, not by actual return made in the shape of profit shown, but upon truly municipal lines, i.e., by the efficiency and cost of the public lighting and the rate at which a supply of electricity is obtainable for private use.

Small towns mean small consumers and usually a scattered area.

The distributing charges will be heavy, so that if there is to be any hope of success the generating charges must be light, which means that the site for a generating station must have very special natural advantages, such as good water power or facilities for cheap fuel, or a combination of the two.

Where there are no such advantages there appears to be no alternative but to wait for the great power companies to pick up such small areas as may be within their reach or upon the direct line of route of their mains to larger ones.

Assuming that the conditions are favorable for generating or obtaining a supply at a low cost—at the commencement the public lighting should be provided for and taken over, and provision only made for private consumers where such are certain to come on in a reasonable time.

The policy of laying the mains for private use well in advance of the demand, though justified in wealthy areas, would not be so in small towns where the conditions are different.

The prospect of profit in supplying small and scattered consumers being very small, there is no room for speculation, and it is of the utmost importance that the capital expenditure be kept as low as possible, and that no capital should be unproductive.

It therefore follows that the system of distribution should possess the maximum of flexibility at the minimum of cost.

Now that distribution up to 200 volts has been successfully established, there are of course many towns where direct current would be feasible and no doubt preferable, but in the majority of cases high pressure alternating current with transformers in street pits and occasionally in houses would be better; where the area comprises a number of private houses and mansions standing in their own grounds and of necessity widely scattered but nevertheless desirable to reach, the alternating system is the only one commercially possible. This question, however, will of course be governed by the circumstances in any particular district, but the question of the actual cost of mains will always remain — a serious item telling against economical distribution on a small scale.

It is therefore the object of this paper to deal with the matter of cheap mains and main laying, that being, I consider, the most important point, the one which lies nearest towards a solution of the problem under consideration.

I therefore propose to bring to the notice of this association two cheap and effective methods of main-laying, of which I have had experience at Bray. First as to the mains in operation at Bray—there have been over six miles of high and 27 miles of low tension laid direct in the ground since 1892, and during that time we have never had a fault on the main line of cables themselves, except where mechanical injury had caused it, and this has very seldom happened. Any trouble we have had has been due to defects in the filling material of the jointing boxes, now overcome, so that this system of laying may claim to have been well tried. In fact, I think the Bray mains are the oldest paper-insulated cables in the Kingdom, other than those from Deptford.

The cables are concentric lead-covered and unarmored. They are taped, but this is, in my opinion, a disadvantage.

In laying, the bottom of the trench was covered with about 3 inches of puddle clay, well wrought, the cables laid in and covered with another 3 inches of puddle clay, evenly put on, and a 7 in. by 1 in. board placed on top, the trench being then filled.

Latterly the timber used for mechanical protection has been larch, being simply the small larch trees, 7 in. thick in the butt, sawn in half; this timber stands well in the ground, requiring no special treatment to preserve it, is cheaper than deal boards and more effective, being thicker. The effect of the puddle clay, impervious to moisture, is to protect the lead covering from any contact with acids or salts in the soil which would attack it, and it has proved so effective that when the cable is now, after eight years, exposed, the lead is absolutely unattacked.

The braiding of the cables has rotted, proving to have been an unnecessary expense. It might prove a source of danger if it allowed a passage of water charged with matter which would attack lead, the life of a lead-covered cable being practically the life of the lead.

As to the jointing, no clips are used; the inners are married and soldered in the usual way, the outer wires are drawn to one side and soldered together forming a loop, all soldering being done well clear of the cable insulation.

The joint is contained in a cast-iron joint box divided longitudinally on the line of two bottle necks for entrance and exit of cable and having on the top side a large hole for filling, (not less than 1 in.) and a smaller hole as air vent, closed by screwed plugs. The cables are served with spun-yarn up to the diameter of the bottle necks and no other packing of the glands is found necessary. The joints having been made and the box screwed up, molten pitch is poured in; the outer side of the bottle necks, beyond the spun-yarn serving, is also filled in with pitch, hollows being formed in the clay for the purpose and here fine clay mixed with the pitch forms a cement which effectually seals up the bottle necks and protects the cable from injury where they enter and leave the box. Such a joint is cheaply made and fulfills every requirement.

It demands only care and requires absolutely no special skill, a very important matter in a small town. This and the fact that it is both electrically and mechanically sound, gives a joint so made, advantages which no form of joint made with clips, that the writer has seen, can claim.

Where any transformer pits lie on the route all cables are brought into the pits and are joined there, inners and outers, with loops of rubber covered single cables. Disconnection of any length of cable for tracing a fault is done by snipping these loops and this works well under our conditions.

Of course in a large scheme where the expense was no object, disconnecting boxes would be preferable, but when used they should certainly be placed in pillars above ground, and so above the reach of flooding, and not in water tight boxes under ground.

As far as the writer is aware the insulation resistance of mains in operation is not easily obtainable. This, however, in no way reflects on the cables; it is partly due to the fact that originally oil was used in the joint boxes but was soon abandoned, not however before the cable ends had suffered, due to water mixing with the oil; the repairing of these ends accounts for the large number of joints. The main cause of the low insulation is due to the large number of joint boxes which still contain a mixture of tar and pitch (the tar having been added as a precaution against cracking of the pitch). This mixture is inferior in every way to the pitch alone which is now always used.

The fact that the resistance from the inner to the outer is in the majority of cases greater than that to the earth is no doubt accounted for at the joints, where the resistance of the pitch has been weakened in the manner indicated, and the surface of the outer is small in comparison to the surrounding box. Their condition, however, causes no anxiety at Bray, as the tests are practically identical with those taken in 1893; the cables have been perfectly steady all along and have lived to see much of the more elaborate and costly draw-in system placed on the scrap heat.

Sufficient has been said perhaps to show that such a system of laying and jointing mains is cheap and reliable, in any case in which no danger from electrolytic action is feared—as where for instance a tram line passed through a town—in such a case the lead would need protection, and recourse to some solid system seems inevitable; but a small town cannot afford the luxury of lead-covered cables laid in this way, and the lead seems to me quite unnecessary, serving no purposes which would not be equally served by any cheap covering which would protect the insulation from damp up to the time of being laid, after which it requires no such protection.

If the cables are concentric the outer insulation can be reduced to that thickness which, with the filling, suffices for the voltage carried; if the cables are not concentric then the covering of each may be reduced to that thickness which, with the filling, is good enough.

The question is, how much the insulation, other than that of the filling compound, may be reduced?

My impression is, that driven by consideration of cost, we shall see this extra insulation year by year reduced in amount till, for low voltage, we come to the bare conductor laid on insulators in the solid filling, and for higher voltage, conductors laid on the same system with very slight extra insulation, relying mainly upon the filling compound.

*Abstract of paper read before the Municipal Electrical Association.

Digitized by Google

The inevitable result of this will be that we shall, for the conductors, use iron or other metal, or alloy, cheaper than copper, since the prohibitive cost of the increased insulation due to bigger cross-section for the same conductivity for such metals, will not have to be faced. At Bray we tested some years ago 80 yards of bare copper mains laid on the solid system, and although roughly laid and badly insulated, the filling compound being a mixture of bitumen, tar and sawdust, this nevertheless stood 1,000 volts for 12 months, and 100 volts for two years afterwards, and was then only taken up on account of building extensions.

From that experiment and subsequent experience I believe it is perfectly possible even now for voltage, say up to 500, covering all low-tension distribution for light and traction, to use wires covered with say a few layers of paper and a light braiding varnished, and the whole laid in troughing filled in with plain pitch at 10s. per ton, which, for all sizes of copper above, say 0.25 in. sectional area, would be cheaper that any cable in the market.

Whatever be the nature of the solid system, the compound for filling both joints and troughing should be ordinary pitch, which has the advantage that it can with ease be chipped out, and is cheap.

CANADIAN NOTES.

The council for the town of Cannington, Ont., will submit a by-law to the ratepayers of the town for the purpose of effecting a loan with which to establish an electric lighting plant to be owned and operated by the municipality.

The Cataract Power Company of Hamilton, Ont., has installed two new generators in its power house at Decew Falls. By the additional power thus provided the company will furnish the city with 6,000 horse-power.

The sub-station of the Lachine Rapids Hydraulic Company at the corner of St. Thomas and McCord streets, Montreal, has been destroyed by fire. The fire originated in a defective switch and in a very short time the entire plant, which distributed the power received from the Lachine Rapids to the various parts of the city, was completely demolished. The loss is about $30,000.

Some time ago the city engineer of Toronto was instructed to prepare an estimate of the cost of constructing buildings and all the necessary plant for the distribution of electric energy in that city. He states that the buildings and plant would cost $950,000 and the cost of installing an arc lighting plant, with a capacity of 1,350 lamps, would be $300,000. If the wires were placed under ground in the central portion of the city the cost is estimated at about $510,000. The annual cost of operating the plant with overhead wires would come to about $63 per lamp per annum, or about 17.2 cents per night.

Mr. George Johnson, of Ottawa, the Dominion statistician, has compiled some interesting figures about the electric railways of Canada. During the year ended on December 31, 1899, the 632 miles of track were so used that the total number of miles run by cars was 26,646,847. The number of passengers carried was 104,033,659. Compared with the previous year, the number of passengers carried increased nearly 9,500,000, and the number of miles run by over a million. The amount of paid up capital invested in electric railways in the Dominion is $21,700,000. The electric cars traveled over four million more miles than the passenger and mixed trains of the steam railways. Together the steam and electric railways carried over 120,000,000 passengers, and the proportion was about 13 by steam to 87 by the electric railways.

Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended July 5:

Antwerp, 47 packages, $3,383; Argentine Republic, 211 cases, $9,047; Australia, 157 packages, $13,136; 1 electric motor, $170; Barcelona, 2 cases, $30; Brazil, 43 packages, $2,492; 8 cases, $826; British Guiana, 80 packages, $8,262; Bristol, 5 cases, $234; British West Indies, 160 packages, $219; 13 cases, $550; British East Indies, 5 cases, $526; Brussels, 12 cases, $435; Central America, 12 packages, $72; Copenhagen, 2 cases, $30; Cuba, 12 packages, $186, Danish West Indies, 2 packages, $55; 17 reels electric cable, $8,331; Dundee, 3 cases, $337; Ekatrinoslaf, 4 cases electric motors, $7,121; Glasgow, 116 packages, $30,981; -- packages electric cable material. $6,718; 269 packages electric motors, $18,180; Havre, 126 cases, $8,429; 2 cases electric vehicles, $5,000; 1 automobile, $1,500; 4 cases automobile parts, $325; 15 packages, motor trucks, $1,550; Hamburg, 232 packages, $22,909; Hayti, 46 packages, $1,233; Liverpool, 52 packages, $5,573; London, 4 cases automobiles, $1,700; 3 cases motors, $450; Manchester, 18 packages, $8,100; Mariopal, 18 cases, $3,754; Marseilles, 9 cases motors, $850; 35 packages, $277; Mexico, 1 automobile, $3,300; 7 boxes automobile parts, $480; 25 cases, $1,505; 72 packages, $11,480; Middleborough, 6 cases, $1,000; Newcastle, 1 case, $365; Nice, 15 cases, $1,572; Porto Rico, 49 cases, $2,318; Rotterdam, 4 packages, $10; Southampton, 225 packages $1,892; Stockholm, 7 cases electrical vehicles, $1,020; St. Petersburg, 3 packages, $20, U. S. Colombia 28 cases, $560; Venezuela, 62 cases, $390.

PERSONAL MENTION.

Mr. Pierre O. Keilholtz, who has been general manager of the United Electric Light & Power Company of Baltimore, Md., since its formation, was recently elected consulting engineer. Mr. John W. Ellard is now general manager.

Mr. Robert K. Gray, of the Telegraph & Maintenance Construction Company of London, Eng., arrived in this city last week. Mr. Gray's business here is in connection with the laying of the new commercial cable from Coney Island to Fox Bay, N. S.

Mr. E. W. Crone, of Pittsburg, Pa., representing the Westinghouse Company, recently went to Orizaba, Mex., to install an electric plant.

INCORPORATIONS.

The Pulaski Electric Light Company, Pulaski, N. Y. Capital stock, $16,000. Directors: Albert F. Betts, William J. Peach and George W. Betts, Pulaski.

The Richmond County Power Company, Albany, N. Y.—to manufacture electricity for light, heat and power. Capital stock, $500,000. Incorporators: S. Thomas, W. E. Findley, both of New York City; M. L. Ryan of New Brighton; F. T. Lewis, O. B. Proal, Jr., N. P. Findley, J. H. Swinerton, all of West New Brighton.

The Croton Electric Light and Power Company, Cortlandt, N. Y. Capital stock, $10,000. Directors: James Murray Mitchell, Robert P. Barry and Armitage Mathews, New York City; Henry M. Haviland, Brooklyn; Joseph R. Swain, Sing Sing.

The Suffolk Engraving and Electrotyping Company, Portland, Me.—to do a designing, drawing, etching and engraving business. Capital stock, $100,000. Officers: President, A. J. Desmond; treasurer, H. L. Cram, both of Portland, Me.

The St. Lawrence Gas, Electric and Transportation Company, Trenton, N. J. Capital stock, $400,000. The company is a consolidation of the gas, electric light and trolley companies of St. Lawrence County, N. Y., and it is understood is controlled by the Widener-Elkins syndicate.

The Sea Side Electric Light, Heat and Power Company, Rockaway Beach, L. I. Officers: William G. Wainwright, president; John Remsen, vice-president; John W. Wainwright, treasurer; John E. Tator, secretary.

ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U. S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

LETTERS PATENT ISSUED JULY 3, 1900.

ELECTRIC RAILWAYS AND APPLIANCES.

653,154. Car-Fender. James Sullivan, Boston, Mass. Filed March 29, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

653,088. Incandescent Electric Lamp. Josef Plechati, Berlin, Germany. Filed Nov. 13, 1899.

653,068. Electric Lamp Socket. Walter A. Church, Pittsburg, Pa. Filed Dec. 21, 1899.

653,159. Electric Headlight Lamp. Harlan P. Wellman, Ashland, Ky. Filed Dec. 14, 1899.

ELECTRICAL MACHINERY AND APPARATUS.

652,856. Speed Governor for Electrical Controllers. James H. McGurty, Jersey City, N. J. Filed March 31, 1900.

652,952. Magneto-Electric Motor. Everett M. Andrews and Melvin N. Andrews, Des Moines, and Charles M. Conger, Adel, Iowa. Filed May 10, 1900.

652,990. Electric Transformer. James J. Wood, Fort Wayne, Ind. Filed March 31, 1900.

653,087. Electric Controller. Slaughter W. Huff, Baltimore, Md., assignor of one-half to Jesse Hilles, same place. Filed July 12, 1898. Renewed June 9, 1900.

653,088. Apparatus for Exciting Alternating-Current Dynamo-Electric Machines. Maurice Hutin and Maurice Leblanc, Paris, France. Filed April 18, 1899.

653,089. Exciter for Alternating-Current Dynamo-Electric Machines. Maurice Hutin and Maurice Leblanc, Paris, France. Filed Nov. 22, 1899.

TELEPHONES AND TELEPHONE APPARATUS.

652,745. Device for Cleaning Telephone-Mouthpieces. Marian N. Clarke, Wilkes-Barre, Pa. Filed Aug. 24, 1899.

652,922. Telephone-Switch. Osgood Plummer, Worcester, and Charles E. Monroe, Boston, Mass., assignors to Frank O. Plummer, Boston, Mass. Filed Jan. 4, 1900.

652,926. Sound Transmitting and Receiving Device. Colin Salmond, San Francisco, Cal. Filed Sept. 7, 1899

652,928. Telephone-Exchange System. Walton Smith, Ridley Park, Pa., assignor to James S. Thompson, North Tonawanda, N. Y. Filed March 28, 1899.

652,977. Signaling Apparatus for Telephone-Switchboards. Joseph J. O'Connell, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Oct. 25, 1899.

653,156. Apparatus for Transmitting Sounds. Elliott Toxey, Mobile, Ala. Filed July 25, 1899.

MISCELLANEOUS.

652,748. Manufacture of Electrical Fuses or Current-Arresters. Francis A. Cote, Ottawa, Can., assignor of four-fifths to Toussaint G. Coursolles, same place, and Frederic L. Beique and Charles F. Sise, Montreal, Canada. Filed March 31, 1899.

652,753. Electrical Time-Recorder. Edward Davis, Boston, Mass., assignor to Meyer A. Bernheimer and Ralph W. Gordon, New York City. Filed June 12, 1899.

652,761. Electrolytic Production of Caustic Soda, etc. Justus B. Entz, Philadelphia, Pa., assignor to the American Alkali Company of New Jersey. Filed May 6, 1899.

652,800. Gramophone Sound-Box. Henry S. Montgomery, Topeka, Kans. Filed Aug. 15, 1899.

652,806. Flexible Electrical Conduit. Harry G. Osburn, Chicago, Ill. Filed Dec. 8, 1898.

652,846. Process of Purifying and Strengthening Brine for Use in Electrolytic Cells. James Hargreaves, Farnworth-in-Widnes, Eng. Original application filed Feb. 12, 1898. Divided and this application filed Aug. 29, 1898.

652,851. Automobile Vehicle. Hosea W. Libbey, Boston, Mass. Filed Oct. 2, 1899.

652,867. Electrical Drying Apparatus. Jean M. J. E. Vignon-Danto, Lyons, France. Filed April 15, 1899.

652,875. Electric-Clock Pendulum. Ernest K. Adams, New York City. Filed Nov. 7, 1899.

652,934. Electric Device for Indicating the Awakening of Persons Buried Alive. Walter J. McKnight, Buffalo, N. Y. Filed May 20, 1899.

652,949. Running-Gear for Automobiles. Charles Cotta, Shannon, Ill. Filed Jan. 17, 1900.

653,093. Apparatus for Supplying Currents of Predetermined Voltage From Main Lines of Higher Voltage. William W. King, Huntsburg, Ohio. Filed Oct. 30, 1899.

653,132. Circuit-Controller. Henry G. Carleton, New York City, assignor to the Carleton Electric Company, same place. Filed Sept. 23, 1899.

653,167-653,168-653,169-653,170-653,172. Motor-Vehicle. Clyde J. Coleman, Chicago, Ill., assignor to Thomas J. Ryan New York City. Filed Aug. 11, 1899, filed Aug. 21, 1899 filed Oct. 2, 1899.

653,173. Refrigeration Apparatus. Clyde J. Coleman, Chicago, Ill., assignor to Thomas J. Ryan, New York City Filed Oct 14, 1899.

653,199. Motor-Vehicle. John H. Munson, Chicago, Ill. Filed May 16, 1898.

653,200. Independent Motor-Vehicle. John H. Munson, La Porte, Ind., assignor of one-half to William F. Roberts, same place. Filed Aug. 29, 1898.

REISSUE.

11,837. Telephone Repeater. William M. Davis, Chicago, Ill., assignor to the Stromberg Carlson Telephone Manufacturing Company, same place. Filed Feb. 9, 1900. Original No. 625,247, dated May 16, 1899.

THE TELEPHONE WORLD.

Telephone Service in Sydney, Australia.

The board recently appointed to inquire into the working of the Sydney telephone service, which for some time after the change to the new switchboard seemed entirely disorganized, has handed its report to the Postmaster General, says the "Australian Mining Standard." The constitution of the board, comprising as it did, one well-known electrician in official service and two in private practice, is an ample guarantee of their competence to sift to the bottom the various irregularities which were complained of, and the impression conveyed by their report is that their work has been well and thoroughly done. One recommendation, and that perhaps the most important of all, was generally looked for. It is that complete metallic currents be adopted throughout the service. This means giving each subscriber a metallic return for the current, as well as the single line which conveys the message. This will be a costly and onerous undertaking, but may, perhaps, be accomplished gradually. Already a commencement is being made with trunk lines connecting the suburban with the central exchange. Until the metallic circuit is provided there will always be annoyance from hearing the conversation of others and from noises produced by the operations of the electric tram, power and lighting operations, which are now becoming so numerous. About three-fourths of the cities which possess a telephone business of the magnitude of that of Sydney have already adopted the metallic circuit, and it can only be a question of time when Sydney and the other Australian capitals follow their example. The greatest interest, however, was excited by the explanations expected of the difficulties which have been experienced in getting the exchange; in being rung up in mistake for the exchange; in being switched on to the wrong subscriber; or being cut off in the midst of a conversation. It is gratifying to learn that these troubles appear to admit of a prompter remedy than that which will be provided by the attractive, but somewhat remote, prospect of the establishment of the metallic circuit. These and other similar aggravating mishaps appear to have been almost altogether due (1) to defects in the working of the new switchboard; and (2) to the operators having too many lines to attend to, and being puzzled by some of the alterations in their practice, which were rendered necessary by the change of boards. In connection with the first the board recommends (*a*) that immediate steps be taken to secure satisfactory working of the indicators. (*b*) That a supply of plugs and coils be immediately obtained. (*c*) That a re-arrangement of the power plant be effected with a view to secure an adequate minimum current at the switchboard terminals, and to provide for the working of the transmitters by a separate battery. With a view to check the use of the lines by non-subscribers, and thus to reduce the amount of work, the adoption of a "toll" system or a charge according to the number of outgoing messages, is strongly recommended. But, pending the adoption of this suggestion, the board states that a reduction should be made in the number of subscribers' lines allotted to each operator. This affords practical proof that the operators have been overworked. It is stated, moreover, that at the time of taking over the new switchboard the staff, instead of being strengthened in the manner that would naturally be called for by the extra work entailed by the change, was reduced by sickness and excess of work. Owing to this cause, the supervision of the operators was not as thorough and complete as desirable.

Indications are that a first-class telephone war will be inaugurated in Iowa Falls, Ia., within the next few weeks, and already skirmishes that foretell the coming fray have occurred, and open hostilities may develop any day. The war will be between the Hawkeye Telephone Company, an independent organization with headquarters in that city, and the Iowa or Bell Telephone Company of Davenport. The former company has just installed a fine exchange system, and has a list of 125 'phones in Iowa Falls. This has crippled the local business of the Bell Company to some extent, and a slash in rates has been announced, making business telephones $1 a month, and residences 75 cents. The Iowa company proposes to better equip its plant, and put up a big fight for the bulk of the city business, while the new company has a big lead in business, so that the ultimate result of the war is naturally watched with much interest.

The New England Telephone & Telegraph Company is to establish a new telephone system in Portland, Me., owing to the fact that the present switchboard is inadequate to the needs of the exchange. It will probably be two years before the new system, which is the latest thing in telephone improvement, is fully completed.

The White Mountain Telephone Company intends, within the next three or four months, and sooner if poles can be obtained, to build a telephone line from Bangor to Houlton, Me.

Two Women Telephone Owners.

There are said to be only two women in the United States who own and operate public telephone systems themselves. One of these is Miss Angie Fruchy, of McComb, O., who attended the National Telephone Convention in Cleveland recently. One of the New Yorkers present said she was able to give quite as many pointers as she received.

When the telephone fever swept over the country several years ago, Miss Fruchy conceived the notion of building a telephone system in her town. The idea met with the hearty support of her friends, and all the business people subscribed. Now she has 100 customers. She charges $24 a year for business service, and about $15 for house service.

A girl operates the central station, and a boy attends to the stringing of wires. Having made a success of local service, Miss Fruchy has built a line about ten miles long from McComb to Findlay, thereby enabling her patrons to talk with people in almost any part of Ohio. Those who are familiar with the business say it pays $2,000 a year.

The other public telephone service owned and operated by a woman is in Asheville, N.C. The proprietress is a daughter of a former Secretary of Agriculture. It is understood that she is doing a thriving business. In both cases there are rarely any complaints from the patrons, and the service is always prompt.

R. Petsch of Berlin, who has lately been visiting at Washington, D. C., is the councillor of the Postal Telegraph Service of the German Empire. As councillor, he has charge of the entire German telephone system. "I am," he said, "investigating the methods in vogue in this country, and am seeking the points of superiority, especially in insulation, that exist here. My inspection is made in an official capacity and I am here as the representative of my Government. There is little difference in method between us. Our exchanges are all manipulated by girls as is done here, and everything else except in minor details is much the same. Of course there are no competing telephone lines, as the whole system is under the control of the Government. That government ownership is a success I think is best attested by the number of our subscribers. In Berlin alone there are 40,000 subscribers, who are divided among nine stations. The largest station has 7,000 'phones, a number that I believe is only exceeded by a station in New York City. Our rates average about as in this country. The highest rate charged is about 180 marks per annum, or about $43. The lowest rate is 120 marks for 400 calls with a supplementary rate of 1½ cents for each additional call. The longest telephone line in Europe is between Berlin and Paris, a distance of 1,600 kilometers, or nearly 900 miles. This is the second longest in the world, that from New York to Chicago being somewhat over that distance." Mr. Petsch will return to Germany in about one month.

A competitor of the New England Telephone Company, with its line in Calais, Me., is now open for business. The people of that city are enabled to talk with parties in the towns of Princeton, South Princeton, Brookton, Waite, Talmadge, Alexander, Danforth, and other places hitherto out of reach by wire. The new concern, which is known as the Lakeside Telephone & Telegraph Company, was organized at Princeton, Me., in 1897, as the Princeton Telephone & Telegraph Company with a capital of $10,000, the name being in the following year changed to Lakeside. Under the charter granted under general laws the company has the right to extend its line from Houlton to Machias, through the towns of Hodgdon, Amity, Orient, Danforth, Brookton, Waite, Talmadge, Indian Township, Princeton, Alexander, Baileyville, Baring, Calais, Charlotte, Dennysville, Cooper, Meddybemps Crawford, Wesley, Northfield, Marshfield; also from Topsfield, to Kingman through Kossuth, Carroll, Springfield, Webster, Prentiss, Drew and Winn.

The village of Charlotte, N. Y., recently granted a new franchise to the Bell Telephone Company, and the company has been putting in new 'phones and stringing new wires. About fifty new 'phones have been installed. The exchange building, which has been undergoing erection during the past few weeks, is about completed.

The civic board of control of Toronto, Canada, purposes to operate a municipal telephone system of from 6,000 to 10,000 subscribers, and plans are being prepared. The Bell Company charges $45 yearly for business and $25 for house telephones, and will not put in new ones except for a material increase in rates.

The Jefferson County Telephone Company has been extending its telephone connections to a good part of the State of Iowa. Within the next month the company expects to have connections with Eldon, Keosauqua, Bloomfield, Ottumwa and Oskaloosa.

The telephone line between Fort Stockton and Pecos, Tex., is now complete.

Telephone Improvements in Germany.

United States Consul Worman at Munich informs the State Department of the forming of a syndicate in Germany, under the auspices of the Bank of Darmstadt, to bring into practical use certain telephone improvements that have been tested in Government offices. These inventions are said to make it possible to retain the spoken word, and to repeat it as freely as desired; to use the same wire for simultaneous conversation by different parties; to repeat the same conversation at various points, and to strengthen the sounds so as to make the long-distance telephone operate with better results.

An event of interest to the officials of Columbus, O., and the Central Union Telephone Company, recently took place when a test of a new magnet fire alarm system was made between Columbus and Springfield over the wires of the telephone company. Each fire alarm box has three magnets and a spring mechanism which produces the current without batteries. There is also a tester which tests the circuits every 2½ minutes to show whether the circuits are in order. If the wire is broken the bell will ring. It is claimed that this system will save the cities thousands of dollars annually by doing away with the batteries.

With the completion of the improvements which the Southern Bell Telephone Company is making in its Columbus (Ga.) exchange, there will be a marked reduction in telephone rates to subscribers. In addition to this a new schedule of rates for different kinds of telephones will be inaugurated which will be appreciated by all classes of subscribers. Usually when a corporation makes such a material improvement in its service as is now being effected by the telephone company in Columbus prices are advanced; and the announcement of reduction of rates will therefore be particularly appreciated by the local public. Under the new system of rates it is said business telephones will range from $2 to $4 per month, and there will be a very material reduction in rates for all residence telephones, including special arrangements for out of town or country stations. All 'phones will be long distance, and this in itself will be a great advantage.

Willis Delworth, proprietor of an independent telephone system at Beloit, Kan., was in Kansas City recently and called on a number of the city officials for the purpose of urging their assistance in securing a franchise from the city council for the Missouri and Interstate Telephone Company.

The citizens of Logansport, Ind., are asking that the New Telephone Company of Indianapolis put in a complete plant at Logansport. The company has asked for a toll franchise. It is claimed that the independent company at Logansport is practically absorbed by the Central Union, and that there is no competition.

Fargo, N. D., was recently made the exchange for thirty long distance telephone wires by the Northwestern Telephone Exchange. This will simplify the work in North Dakota and the northern part of Minnesota.

The Cumberland Valley Telephone and Telegraph Company of Jeffersonville, Ky., has begun the work of laying a conduit on Court avenue in order to meet the demand of its increased business.

The local telephone exchange which has been in operation at Belmond, Ia., for a year, was recently absorbed by the Western Electric Telephone Company. It is thought that other towns will be forced to sell out to the larger concerns.

An independent telephone company has lately been organized at Williamsburg, the county seat of Whitley County. It is known as the Whitley Telephone Company and is said to be backed by some of the best citizens of the town.

TELEPHONE INCORPORATIONS.

The Venton County Telegraph Company, Camden, Tenn.,—to construct and operate a telephone line. Capital stock, $2,000. Incorporators: G. W. Baker, H. A. Caraway, L. Caraway, W. A. Weldon, S. A. Bullock, all of Camden.

The Automatic Telephone Exchange Company, Princeton, N. J.—to operate a telephone system in and about Princeton. Capital stock, $3,000. Incorporators: Henry N. Green of Trenton, and Prof. William Libbey of Princeton.

The West Penn Long Distance Telephone Company, Pittsburg, Pa. Capital stock $10,000.

The Hardin County Telephone Company, Eldora, Ia. Capital stock $50,000. Incorporators: E. H. Lundy, J. H. Bales, Dr. C. C. Gethman, L. M. Follett and Dr. C. F. Bennett.

The Pekin Telephone Company, Pekin, Ill. Capital stock $10,000. Incorporators: James W. Barrett, John C. Mead and William A. Potts.

GENERAL NEWS.

What is Going On in the Electrical World.

LIGHTING.

Adel, Ia.—Macy & Hancock will soon erect an electric lighting plant.

Alliance, O.—A municipal electric light plant will soon be erected here.

Appleton, Wis.—The Appleton Electric Light & Power Company's plant was recently damaged by fire; loss, $12,000.

Arlington, Ore.—There is a proposition before the people of this place for putting in an electric light plant.

Bellaire, Mich.—J. L. Hisley of Sparta contemplates the erection of an electric light plant at this place.

Broadalbin, N. Y.—John L. Moore, of New York, is preparing to put in an electric light plant here.

Centreville, S. D.—An entire new equipment has been purchased for the electric light system to be established here by G. Norgren, a local capitalist.

Deming, N. M.—The Deming Ice & Cold Storage Company is to erect an electric light plant here.

East Jordan, Mich.—The common council recently granted a 10-year electric lighting franchise to G. E. Anthony of Manistee. The plant is to be installed at once and lights running within 60 days.

Eddyville, Ia.—This town has decided to establish an electric light plant.

Elsinore, Cal.—This city contemplates the purchase of an electric lighting plant. Address J. D. Hoff.

Farmland, Ind.—In all probability a contract will soon be let for an electric light plant here.

Gibsonburg, O.—The Gibsonburg Electric Light Company was lately incorporated with a capital stock of $12,000.

Greenport, N. Y.—The board of trustees of this village is to open bids on July 16 for electric light bonds to the amount of $5,000. The money is to be used in the improvement of the electric lighting plant.

Kirkwood, Mo.—An election will be held July 21 to vote on the question of issuing $17,000 bonds to build an electric light plant.

Leesville, La.—The Leesville Waterworks Company has franchises for an electric light and power plant.

Neoga, Ill.—The voters of this city have decided to put in an electric light plant.

Olivet, Mich.—The people here expect to have electric lights in the near future.

Orion, Mich.—The village council is considering the project of building an electric lighting plant.

Ottawa, Ont.—The Ottawa Electric Company will erect a new electric light plant to cost about $300,000. J. W. McRae, manager.

Pomeroy, O.—The Electric Light Company is getting ready to install an entire new equipment of its power plant. The improvements will consist of the most modern up-to-date machinery of large capacity.

Rangeley, Me.—The Rangeley Electric Light & Power Company contemplates the erection of an electric light plant at Rangeley Lake.

Ravenswood, W. Va.—The council has granted to C. E. Chidester, of Parkersburg, a franchise to erect an electric light plant in this place, and contracted for the lighting of the town with 20 arc lights at $1,000 per year.

Rhinebeck, N. Y.—The articles of incorporation of the Rhinebeck Electric Lighting Company were filed a short time ago. The work of constructing the plant will begin soon.

Riverside, Cal.—Bids will be received until July 17 for the purchase of steam and electrical machinery for the electric light plant. Address C. R. Stibbens, city clerk.

Sag Harbor, N. Y.—At a special meeting of the board of trustees, C. H. Vaughn, F. W. Lister and William R. Reimann, held a short time ago, an agreement was entered into between the village and the Sag Harbor Electric Light & Power Company to furnish this place with a street lighting system.

San Francisco, Cal.—This city is considering the advisability of erecting a municipal electric lighting plant.

Toronto, Ont.—J. R. Stratton, provincial secretary, has recently completed a contract with the Hamilton Electric Light & Cataract Company for electric current for lighting the building and grounds of the Hamilton Asylum for the Insane.

Victor, Col.—The city council recently let a five-year contract to the Gold Belt Electric Company to supply the city with light.

Washington, D. C.—Col. Bingham, the engineer officer in charge of public buildings and grounds, is making arrangements for the installation of a first-class electric plant in the Washington monument. Specifications are being prepared, and the work will be hastened as rapidly as possible. He expects to have the plant installed and the new elevator in operation before the end of the present year.

Wellington, Kan.—This city has sold $14,000 in bonds for erecting an electric light plant. Work will be started at once.

Westminster, Md.—The Citizens' Water & Power Company, of which J. B. Boyle is secretary, wants to purchase machinery for an electric light plant.

STREET RAILWAYS.

Albion, Mich.—The common council recently granted a 30-year franchise to the Kalamazoo Valley Electric Street Railway Company.

Alexandria Bay, N. Y.—Surveyors are working near this village in contemplation, it is said, of a trolley line which will run between Redwood, Clayton and this place. The enterprise is a scheme of the International Electric Light Company.

Altamont, N. Y.—There is some talk of building a trolley line between here and Schenectady. Should the proposed road be constructed it would be operated both as a freight and passenger road.

Beaumont, Tex.—A committee composed of W. S. Davidson and T. W. Shepherd was recently appointed to visit Galveston and investigate the system of construction and operation of the street railway there, as local capitalists are considering the advisability of building an electric street railway in this place.

Bridgeport, Conn. — The Bridgeport Traction Company is about to expend between $15,000 and $20,000 in putting its tracks on all the lines in first class condition. The work has already been started and consists of rebonding all the tracks with copper wire. When finished, it is estimated by the officials that 50 per cent. of the current will be saved.

Buffalo, Wyo.—Local capitalists are considering the feasibility of building an electric railroad from here to Clearmont on the Burlington.

Carsonville, Mo. — A blanket franchise was lately granted to the Wellston, Creve Coeur Lake and St. Charles Electric Railway Company. The proposed route will begin at this place, thence running along the National Bridge road to a point of intersection with the St. Charles Rock road, and running through Bridgeton.

Catskill, N. Y.—William E. Stewart of Harrisburg, Pa. has been arranging the preliminaries for the construction of the Catskill Electric Railway.

Detroit, Mich.—Detroit and Windsor capitalists are behind the project for building an electric line from Windsor to Chatham. It is expected that the company will be incorporated shortly. The present intention is to commence the work of construction early next spring, but it may be begun sooner if the necessary arrangements can be made.

Easton, Pa. — The articles of incorporation of the Doylestown and Easton Railway Company were recently filed in this city. The company is capitalized at $100,000. The directors are President Harry J. Shoemaker, Samuel A. Hellyer, Mahlon H. Stout, S. J. Penrose and E. Wesley Keeler, all of Doylestown, and Joseph Leedom of Philadelphia.

Glens Falls, N. Y. — It now begins to look as if the proposed electric road between here and Warrensburgh is to become a certainty. The two most prominent promoters of the road are Hon. A. B. Colvin of Glens Falls and Joseph A. Powers of Lansingburgh.

Hartford, Conn.—The Hartford Street Railway Company is about to make six trolley line extensions, besides double tracking its old lines. These proposed lines will add nearly eight miles to the trolley service of the city.

Irondale, Ala. — Mr. A. Turpin and associates have been granted franchises and will establish an electric street car line, electric light plant, etc.

Mechanicsburg, Pa.—In view of a number of property owners refusing the right of way between this city and New Holland the Lancaster, Mechanicsburg and New Holland Electric Railway Company lately decided to build the line under the general railway law and operate it by electricity. The road is to be completed this year.

Milwaukee, Wis. — According to the statement of Manager John I. Beggs, the Milwaukee Electric Railway & Light Company will soon start the preliminary work on the construction of an electric line to Chicago, which Mr. Beggs claims will be so built and equipped that its cars will equal the rate of speed maintained by the steam railways.

Norwich, Conn.—At a recent meeting of the directors of the Norwich Street Railway Company, who represented a majority of the stockholders, all were heartily in favor of the extension of the electric road to Baltic, and authorized the building of the same.

Pasadena, Cal. — The signs point more strongly than ever to the building of an electric road between this city and Alhambra and connecting Alhambra with Los Angeles. Chief Engineer Kuhrts of the Los Angeles and Pasadena line is interested.

Penn Yan, N. Y.—The proposed electric railroad on the east side of Keuka Lake, which has been talked of for so long seems now assured.

Pittsburg, Pa.— Ground is to be broken soon for the construction of the new Evergreen electric road into Reserve township, on the Northside. Francis J. Torrance, T. M. Latimer and H. M. Davidson, who are interested in the promotion of the scheme, have their plans prepared. The line is to be four miles in length, the estimated cost of which is about $350,000.

Quakertown, Pa.—The management of the Quakertown Trolley Company announces that it is about to begin operations on the extension of the line from here to Doylestown.

Ravenna, O.—The promoters of the Portage Lakes Transit Company have the necessary consents for the construction of the proposed electric line from Bedford to this city and Kent. F. Rockfeller of Cleveland will furnish most of the capital.

Rockford, Ill.—L. G. Bastedo of Chicago, treasurer of the Illinois and Rock River Railway Company, is in Dixon to take charge of the engineering work to be done by the company on its electric road from Dixon to this city.

Terre Haute, Ind.—A company of capitalists, including several Boston men and W. P. Ijams of this city has secured franchises on five roads leading out of Terre Haute for electric railroad rights-of-way. The company has a capital stock of $800,000 and work will begin on the lines within a few months.

Whitestone, N. Y. — A petition bearing the names of several hundred residents of this place and Willets Point has been sent to the officials of the North Shore Railroad Company, asking them to extend their trolley tracks from Flushing to Whitestone.

MANUFACTURING.

Columbus, O.—The Erner Hopkins Company of this city was incorporated lately by John A. Erner, William A. Hopkins, Jr., F. R. Huntington, John M. Clark and Theodore M. Livesay, with a capital stock of $10,000. This concern will make and deal in electric supplies and construction and repair material.

Trenton, N. J.—The Arnold Monophase Electric Company was recently incorporated here with a capital stock of $500,000. The purpose of the company is to manufacture and deal in single-phase alternating current motors. Charles F. Eggleston of Philadelphia, Francis B. Lee and Nelson Petty of this city have an interest in the concern.

COMPANY MATTERS.

Dubuque, Ia. — The Home Electric Company, the Dubuque Street Railway Company and the Star Electric Company of this city have agreed to consolidate into a corporation capitalized at $500,000.

Kansas City, Mo.—The stockholders of the Kansas City Electric Light Company held their annual meeting a short time ago, and re-elected all the directors.

Long Island City, N. Y.—The board of directors of the New York & Nassau County Railway Company, recently elected the following officers: Joseph Bermel, president; P. R. Marra, vice-president; E. J. McKeever, treasurer; W. L. Woodill, secretary. The directors adopted a resolution requesting the State Board of Railroad Commissioners to set a date for a hearing upon an application for a franchise. The proposed route is from the Queensborough line near Queens to Hempstead village, and is capitalized at $150,000.

Nanticoke, Pa.—At the recent annual meeting of the Nanticoke Electric Light, Heat & Power Company, the following officers were elected; President, C. E. Stegmaier; vice-president, Dr. J. A. Bullard; treasurer, Geo. W. Beers; secretary, W. D. Beers.

POWER AND TRANSMISSION PLANTS.

Everett, Wash.—The county commissioners recently granted the Snoqualmie Power Company a franchise to transmit electric current along any of the county roads, and to engage in such other business as is carried on by an electrical power company. The franchise is granted to the president of the above company. Mr. Charles A. Baker.

Middletown, N. Y.—It is understood that New York parties have purchased valuable water rights and privileges at Eden Falls on the Neversink River, and propose to erect a large station, equipped with the latest and most improved electric machinery, and to manufacture electricity for transmission for use for power purposes to Port Jervis, this place, Monticello and Liberty.

AUTOMOBILES.

Detroit, Mich.—A party of Chicago men have been visiting the various township officers to inquire if they can secure permits to run automobiles through the townships at a high speed. The gentlemen promised that four machines, each seating 20 persons comfortably, would be placed on the road at first in order to see if the experiment would be a success.

Springfield, Mass.—Local capitalists are interested in an automobile delivery van, the invention of S. H. Barrett of this city, and a company will probably be formed here to manufacture them. Ten business men have put money into one, and a trial trip recently made proved successful.

Wilmington, Del. — The Jackson & Sharp Company recently completed for service in Washington, D. C., five new vehicles called autocarettes. They are trolley car bodies mounted on automobile running gears, and will be operated by storage batteries. In appearance they resemble small trolley cars, and are finished in the same manner. They are mounted on rubber tire wheels and will be used on the streets of the capital. In course of time they may become rivals of the trolley cars.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16⅛@16¼c.; Lake, 16¼@16½c.; casting, 16@16⅛c.

Business failures in the United States in the first half of 1900 comprised the smallest number in eighteen years.

The Easton (Pa.) Consolidated Electric Company reports gross earnings for May as $21,216 and net earnings as $6,787.

The Whitney-Widener-Elkins syndicate has consolidated all the traction interests in St. Lawrence County, N. Y.

The Chicago Union Traction Company has declared a dividend of 1½ per cent. on the preferred stock, payable July 20.

Foundations have just been completed by the United Railways & Electric Company, of Baltimore, Md., for some very extensive repair shops in that city.

The Erie Telephone management claim a net gain of 2,744 subscribers in June. Total number connected June 30, 126 455. Number waiting connection 6,073.

The Edison Illuminating Company of Detroit, Mich., has filed a notice of the increase of its capital stock from 30,000 shares of a par value of $750,000 to 36,000 shares of a par value of $900,000.

Justice Herrick at Albany has issued a writ of certiorari directing the State Board of Tax Commissioners to review their assessments under the franchise tax law upon the lines of the Metropolitan system of New York.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 16@18; New York Electric Vehicle Transportation, 5¼@6¼; New England Transportation, 3¾@4¼; Gramophone, 35@40.

The Consolidated Traction Company of Pittsburg, Pa., has awarded a contract for 42 miles of feeder cables. The new cable will be used largely to supply current for the operation of several extensions now under construction.

Elmer Wilson, of the Niles (O.) Electric Company, is securing the right of way for an electric railway between Niles and Salt Springs, where a hotel and sanitarium are to be built. The same company proposes a line to Warren and Youngstown.

It is reported that the Augusta (Ga.) Railway and Electric Company have secured a new mortgage for $1,000,000 with the Mercantile Trust & Deposit Company as trustee. The new issue will retire the old bonds outstanding, and provide for extensive improvements.

The Massachusetts Board of Railroad Commissioners has granted the petition of the Boston Elevated Railway Company for the additional issue of capital stock to the amount of $9 500,000; $3,100,000 is to be applied to construction and equipment of the elevated structure of the railway, including foundations tracks and electric system.

The statement of earnings of the Metropolitan system of New York for the month of June was made public on the 8th inst. It showed a total of $1 237,580, as compared with $1,198 800 in June of 1899. This completes the Metropolitan's fiscal year, and shows the total earnings for the year to be $14,249,050, an increase over the preceding year of $1 535 815.

The Economy Light and Power Company of Joliet, Ill., has given a trust deed to the Illinois Trust and Savings Bank of Chicago for a period of fifteen years, in the sum of $300,000, embracing 300 bonds of $1,000 each. The mortgage covers all the real and personal property of the company. The first mortgage coupon bonds are dated June 1, 1900, and are payable to bearer June 1, 1915. They bear interest at the rate of 5 per cent. which is payable semi-annually. Both interest and principal are payable in gold coin.

According to the "New York Journal of Commerce" the recent predictions of copper producers that buyers would enter the market during the current month appear to be already meeting with confirmation. A perceptible increase in the number of inquiries is reported, and there has also been some improvement in the amount of actual business. Some sales of copper have been made at 16 cents up to the end of the current year, and it is the expressed opinion of some sellers that the price will not go below that figure during the coming six months.

The Consolidated Traction Company, which owns the trolley lines between Jersey City and Newark, recently ordered a second semi annual dividend of 1 per cent. paid to its stockholders. The first dividend was paid last January. The Consolidated is leased by the North Jersey Street Railway Company, and the latter under the terms of the lease last week paid to the Consolidated $150,000. This money will be used to pay the dividends July 15. Next January the North Jersey will pay another $150,000 to the Consolidated Traction Company, and the latter will pay another 1 per cent. dividend with it.

A special meeting of the stockholders of the General Electric Company will be held July 17, at Schenectady, to vote on the proposition to increase the capital stock by $4,415,000 to retire outstanding debenture bonds. The suggestion comes from Wall Street quarters that the company offers the new stock to present shareholders at par. It is figured that the rights would give shareholders about 20 to 25 per cent. on new stock at par, equivalent at present prices to a dividend of about 7 per cent. It is further suggested that this would be nothing more than doing right by stockholders, inasmuch as out of earnings aggregating some 25 per cent. in 1899, stockholders received only 6 per cent. and the business so far for 1900 is acknowledged to be fully holding its own.

A plan has beeen consumated to consolidate all the electric and gas lighting interests in Queens Borough (N. Y.) into one company. The negotiations are being conducted by Wilson & Stephens of 41 Wall street. The only company which will not be included in the deal is that at Far Rockaway. It is understood that the purchasing company intends to concentrate all its interests in one vast lighting enterprise to cover the borough of Queens, which has the largest area of any borough in New York. A mammoth power-house is to be built from which the current will be sent all over the borough, and which will be run at much less cost than the numerous power houses in the territory. The company will also do private business, providing electric light for houses, and it is also intended to supply electricity to private families for cooking purposes.

The publication of an alleged statement of the earnings of the Brooklyn Rapid Transit Company caused a sharp break in the stock yesterday, declining from the high figure of 56⅛ to 50¾, and closing at 51¼, a net loss of 4⅞ points, on sales of approximately 70,000 shares. Vague rumors were heard that developments in the affairs of the company that would not be regarded as altogether favorable were pending, and these tended for the time being to check speculation in the stock. Later these promised developments took definite form when what purported to be an advance statement of the earnings of the system for the year ended June 30 was put out by several news agencies. This statement showed gross earnings of $11,200,000, operating expenses of $7,168,000, net earnings of $4,032,000, and other earnings of $400,000, making gross income $4,432,000. Charges and taxes for the year amounted to $4,201,000, leaving a net income of $231,000—less than enough to pay the estimated tax of $400,000 under the Ford franchise law, should that law be enforced.

ELECTRICITY.

Vol. XIX. NEW YORK, JULY 18, 1900. No. 2.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4021 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES,	$2.50
IN CLUBS OF FIVE OR MORE,	2.00
FOREIGN COUNTRIES,	4.50
SINGLE COPIES,	10 cents

Remit by Express, Money Order, Draft, Post Office Order or Registered Letter.

ADVERTISING RATES.

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application.

Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter

EDITORIAL NOTES.

The Electrical Congress of the Paris Exposition.

The International Electrical Congress at Paris, which will be held from August 18 to 25, will bring together in the French metropolis noted scientists from all parts of the world, eager to take part in the discussions of the latest inventions and discoveries.

The Electrical Congress is only one of many that will be held. The congresses as an adjunct to the Exposition have been made a recognized part of the latter, to the extent that each country has been requested, through its commissioner general, to designate two or three persons for each congress. These will be known as the official delegates from their respective countries. This does not absolutely limit the representation from a country to the number mentioned. Local and national organizations may send delegates, but the actual work of each congress will be assigned to official delegates. So great is the interest manifested in the congresses, and so palpable is its connection with the material features of the Exposition, that all who desire to receive the benefits of the meetings may become members on the payment of a small fee (20 francs).

The Electrical Congress will consist of five separate and distinct sections in which the following general subjects will be discussed: "Scientific Processes and Measuring Instruments; Production of Electrical Energy; Electro Chemistry, Telegraphy and Telephony, and Electro-Physiology." These general heads will again be subdivided. Under the first, topics such as "Magnitudes and Units, Methods of Measurement, Measuring Instruments, and Photometry," will be dealt with. In section two "Transmission and Distribution, Electric Traction and Lighting" will be treated. Under Electro-Chemistry various types of apparatus and the electrolytic treatment of ores of copper, zinc, lead and nickel, besides many special applications will be described. In section four, the many types of batteries in use for telephone purposes, besides overhead and underground line construction will receive the attention of the delegates. In this section the subject of submarine telegraphy and telephony as well as wireless telegraphy will also be brought up. In the section devoted to Electro-Physiology, the production of electricity by living beings, as well as the action of electricity on living beings, will be gone into. In addition to these, measures to be adopted with persons suffering from electric shock will be suggested.

While the Congress is in session, the delegates will be afforded an opportunity of visiting the principal electrical plants and installations in the vicinity.

The bringing together of such an intellectual body of men, each a specialist in some department of electrical engineering, should be the means of ultimately giving to the world at large much valuable information regarding new devices and theories.

* * *

Trolley Lines as Freight Carriers.

A few years ago it was an unusual thing for a trolley road to carry freight of whatsoever nature, while now reports from all over the country would seem to indicate that trolley companies are beginning to realize that large profits may be obtained from traffic of this nature. Last winter the running of express cars in Brooklyn by an express company caused some legal complication, the court finally deciding that according to the general railroad law of 1890 a trolley company had a perfect right to transport express matter if it so desired. On the strength of this decision arrangements are now on foot looking to the organization of a trolley freight line in that borough with a capitalization of $1,000,000. The company expects its cars will be in service by winter and proposes to secure privileges for moving ashes, stone and earth for the city, and for carrying coal, sugar, lumber and other freight for firms and individuals. The Brooklyn Rapid Transit Company is said not to be interested in the project, except that it will receive compensation for the use of its lines and power. Interests identified with the company, however, are believed to be back of the scheme.

But this is not the only State in which it is proposed to utilize trolley lines as freight carriers. In Michigan a road is about to be built between Saginaw, St. Charles and Durand, which, as it passes a number of coal mines, will incidentally convey fuel from one point to another. By this means it is claimed that the cost of hauling will be slightly reduced as against the present rates charged by the steam road. The trolley line in question will

Digitized by Google

also be used for hauling sugar beets from the farms along the line to the factories.

In northern Illinois a similar road is projected, while in other parts of the country trolley roads are beginning to compete—on a limited scale as yet—with steam roads as freight carriers. This condition of affairs is causing some uneasiness in steam railroad circles, so much so that Mr. Cicero J. Lindley, of the Illinois Railroad and Warehouse Commission, in an address before the National Convention of Railroad Commissioners in Milwaukee suggested the placing of electric lines under the control of a commission similar to that of the steam roads.

Looking at the matter from an unprejudiced standpoint, there would seem to be no valid reason why trolley roads should not carry freight, providing of course it does not interfere with the transportation of passengers. That railroad officials should feel more or less anxious and annoyed at this new departure is only natural, for in time it cannot help but affect the business of some of the railroads, especially in the line of farm products.

It should also somewhat tend to hurt express companies. But on the other hand the carrying of packages and light freight by trolley companies might, as we have previously stated in these columns, prove of benefit to the general public, where a road runs from a thickly settled community out into the suburbs. With such a road the carrying of freight would unquestionably be of advantage to commuters, and would to a great extent obviate the filling of a passenger coach with bundles of all sizes and shapes.

Another advantage of a trolley freight carrying system, such as that suggested for Brooklyn, is that it should tend to reduce the number of drays and trucks on the street, which would be a most welcome innovation, especially to the public of New York City.

* * *

Trial of a Huge German Airship. In the issue of ELECTRICITY of November 15, 1899, we referred in these columns to an airship that was being built at Manzell on the Lake of Constance in Germany, which surpassed—at least in point of size—anything yet attempted in the aerial navigation line. This airship has now been completed, and was given a trial last week, which, if advices from abroad may be relied on, was most successful in every particular.

This problem of devising a suitable structure capable of traveling through space has gradually become an important one, well-known inventors in all parts of the world having been at work on it for some time.

The prize offered by an enthusiast on this subject, to be competed for at the Paris Exposition, has further tended to stimulate interest in this method of propulsion, with the result that, figuratively speaking, thousands of eyes are being directed toward the experiments that are being carried on with the immense airship built under the direction of Count von Zeppelin, at Manzell-am-Bodensee.

As we have several times stated when referring to this subject the greatest difficulty to be overcome in an enterprise of this nature lies not so much in the inability to raise a weight from the earth as in properly guiding the airship in its course through space. Whether this heretofore apparently insurmountable obstacle has been successfully overcome in the Zeppelin airship is not clearly set forth in the report at hand. From the fact that the experiment had to be postponed a day owing to "an unfavorable west wind," it is to be inferred that the inventor and his assistants had their doubts as to whether it could be guided in the desired direction. As it was on the day of the initial trial the structure containing five persons traveled without accident from Friedrichshäfen to Immenstadt, a distance of about fifteen miles.

The airship, which has a length of over 500 feet and a diameter of 37 feet, is made up of seventeen independent balloons, contained in a skeleton structure, and is propelled by means of powerful benzine motors, which are located in aluminum gondolas suspended below the structure. These motors operate air propellers situated beneath the front and rear ends of the carrying body. The explosions in the motors are brought about in the usual way by electric sparks, the power generated being transmitted to the propellers through steel tubes. The air vessel is capable of lifting a weight of ten tons, and the inventor confidently expects be able to travel at a rate of speed of twenty-two miles an hour.

Great secrecy has been maintained as to most of the details of construction of the airship, it being to a certain extent a Government enterprise, inasmuch as it is understood considerable sums of money have been advanced by the German Government. If the device proves a success after an extensive trial it will no doubt be looked upon by Emperor William as a powerful weapon of warfare, by means of which, if occasion required, cities could be dedestroyed and country laid to waste.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

MR. CARL HERING has been named vice-president of the jury of the Electrical Class at the Paris Exposition, and also vice-president of the jury of the group in which this class is included.

CARS are running regularly on all the Transit Company's lines in St. Louis.

DR. LOUIS DUNCAN has been selected as chief engineer by the directors of the Keystone Telephone Company of Philadelphia.

THE conductors on the Metropolitan Street Railroad Company, Washington, D.C., threaten to strike because of the inaccuracy of the cash registers.

AN economical change from steam to electrical power is to be made at the Norton Brothers' slate quarries on Briar Hill, Granville, N. Y. They will start in with an eighty horse power motor and if it works satisfactorily their entire plant, requiring upwards of 200 horse power, will be operated by electricity. For this purpose another large and more improved dynamo will be put in.

U. S. CONSUL HUGHES, in a report to the State Department in regard to electric cartridges, says: "An Italian electrician has invented an electric cartridge, which he offers as a substitute for dynamite and smokeless powder in mines, rock blasting, and for heavy ordnance. The composition used in the cartridge is made up of carbonates of potash and chloride of ammonia, the proportion varying according to the use. The discharge is affected by an electric spark, which produces electrolytic effects upon the chemicals. The inventor claims that the cartridges, until subjected to the effect of electricity, are entirely inoffensive and perfectly safe; so that there will be no necessity for isolating the magazines where they are stored."

AMONG the features of "The Greater Interstate Fair," to be held at Trenton, N. J., September 24-28, will be an automobile exhibition and automobile races. No charge will be made for space for exhibiting automobiles and their accessories. The automobile races, of which there will be five, will take place September 24. The course will be from five to ten miles. The prizes will be $100 in three races, $200 in the fourth, and a cup in the fifth race.

ACCORDING to news received from London, in the House of Commons on the 12th inst., the Secretary of State for the Colonies, Joseph Chamberlain, announced that tenders for laying the Pacific cable would be invited immediately, the Government of Canada and the various colonial Governments interested having accepted the recommendations of the committee.

A DEAL involving $2,000,000 and financed by a Cleveland trust company, is under way for the formation of a syndicate to operate the electric transportation systems in six of the largest cities in Mexico. The headquarters will be in New York.

WILLIAM H. JAKWAY, M. S., formerly an instructor in the department of physics at the Syracuse (N. Y.) University, and now an X-ray expert, has completed a Wehnelt electrolytic interrupter, an electro-chemical contrivance for breaking electrical currents, and gave a successful exhibit last week. The contrivance was first used on direct currents and latter was found to work on alternating currents. On direct currents it takes the place of a mechanical vibrator on induction coils, particularly in use with cathode ray machines. By its use an alternating current may be used to run X-ray machines and not clog or dim the Crookes tubes. The contrivance was invented a year ago and Mr. Jakway succeeded in making one from a brief written description.

AN attempt has been on foot to arrange between the powers now operating in China for an international cable connecting the base of Chinese operations either with Shanghai, Port Arthur, Yokohama, or some other point through which more speedy communication can be had with the outside world. The State, War and Navy Departments have all been parties to the conference, which has been conducted with a great deal of diplomatic secrecy. Both the War and Navy Departments have been figuring for months on a trans-Pacific cable, and consequently have all the necessary information at their fingers' ends. The War Department now has fifty miles of cable ready o ship to Manila, to be followed by 400 miles more about August 1. This was to be used for inter-island communication in the Philippines, but the urgency of the case may cause it to be diverted to China. No point has yet been decided on for either end of this international line, Che Foo and Taku both having been

Digitized by Google

discussed for the Chinese terminus. It is 600 miles by water from Taku to Shanghai, the terminus of the British cable. It is less than 100 miles from Taku to Port Arthur, but the Russian land lines both in Korea and Manchuria have been subject to such serious interruption as to almost bar the consideration of this route for the international connecting link. The expense of this undertaking, according to the present tentative arrangements, will be borne jointly by the powers interested. It is impossible at present to give a fair estimate of the time that would be consumed in carrying out the project, but it is probable that the United States is in position to do the work more quickly than any other nation.

SUPERINTENDENT PATTERSON of the New York division of the Pennsylvania Railroad has convinced himself by practical tests that the telephone is handier than the telegraph in communicating with his men along the line. He has a telephone instrument in his private car and whenever he desires to communicate with any place on the line the car is stopped, a lineman quickly makes a connection with the wires along the side of the track and a conversation can be had in less time than it would take to send a "rush" telegraph message and get an answer.

ELECTRIC lights and electric fans add much to the pleasure of traveling on railroad coaches, and the Canada Atlantic Railway has commenced installing such on their passenger cars. Mr. M. R. Shedd, of the Gould Electric Car Lighting Company, of Depew, N. Y., is in Ottawa installing the necessary plants on the cars. The dynamos used hang under the car and have belts attached to the axles, and are double system storage batteries. The Governor-General's car, "Victoria," has been equipped with the lights and fans.

A MEASURE designed to prevent electrolysis on the water pipes and conduits of Chicago has been recommended to the city council for passage by the committee on judiciary. The measure prevents the telephone and telegraph companies from laying wires around or wiring close to the water pipes. It was framed by City Electrician Ellicott, who says great damage has already been done to the city water mains.

A NUMBER of the big trunk lines, among them the New York Central and the Lackawanna, are making experiments with a new method of lighting cars by electricity. By this system the electricity is generated by power furnished by the revolutions of the axles of each car, for each of which a separate storage battery is provided in which the electricity is stored. The advantages of this system over oil lamps and gas lighting are said to be its safety in case of collisions, preventing explosions and the setting on fire of wrecked cars. It also does away with extensive plants for the generating of gas, such as are necessary under the Pintsch system. According to a recent statement electric light by car-axle power is to be the system of the future.

C. H. STORMS, electrician for the Rapid Transit Company of Waterloo, Ia., has invented a block alarm system, which is now in use by the company. When a car passes a switch it lights an electric light at the next switch, which remains lighted until the line is clear. It prevents delays by overdue cars, as it is always a guide as to whether or not the track is clear.

THE London "Electrician" says it is informed from a reliable source that there is a likelihood of an amalgamation taking place between the two big German electrical undertakings of Siemens & Halske and the Allgemeine Elektricitäts-Gesellschaft. This is not very surprising, as they both work with very large capital, and are really to a great extent only competing between themselves. The former firm has quite recently erected enormous works at Nonnendamm, which is near Berlin, and, in fact, the works had to be built near a large town or city, as they give employment to over 6,000 workmen and officials, and the question of the housing of this number had to be considered. The whole of the property which has been acquired has not yet been built over, as the company intend at a future date to remove their dynamo works from Charlottenburg, and plans are in preparation for the works to be built for this purpose at Nonnendamm.

THE first street railway convention ever held in England closed recently, and our London correspondent says that "Englishmen are at last becoming just a wee bit Americanized in the matter of electric traction."

THE tenth annual meeting of the American Electro-Therapeutic Association will be held on September 25, 26 and 27, at the Academy of Medicine, in New York City. Among the other features of the convention will be two interesting discussions: 1. "Electricity in Gynecology and the present Reluctance of Gynecologists to use Electricity." 2. "Electricity in Tuberculosis and the Present Modes of Treatment." Dr. Walter H. White of Boston, is the president.

IN a paper read before the Société Physico-Chimique Russe, and abstracted in a recent number of the "Journal de Physique," a method is developed by M. Boulgakoff for calculating the value of a tore of certain dimensions. For a surface generated by the revolution of a disk 3 cm. diameter, whose center describes a circle of 30 cm. radius, the capacity was calculated to be 10.8253 electrostatic units. Careful measurement gave, experimentally, the value 10.82, thus conclusively justifying the accuracy of the method of calculation. It is shown as a deduction from the experiments, that a value for v can be obtained which does not exceed 3×10^{10} cm. per second by as much as $\frac{1}{1000}$th.

A GOOD deal of interest attaches to electrical affairs in the East just now; therefore it is worth quoting from the "Hong Kong Daily Press" that the Canton Electric Lighting and Fire Extinguishing Company, Limited, has just held an extraordinary general meeting. Among those present were Mr. Fung Wa Chuon, who presided, and Messrs. Lil Tze San, Tam Tsz Kong, Li Yuk Tong, Lo Ki, Tam Wai Tong, Chan He Wan, Liao Fung Shu, Fung Hi, Lam Yuk Ling, and Pun Tsz Seung. The chairman, Mr. Fung Wa Chuon, proposed that the company be wound up voluntarily. Mr. Tam Tsz Kong seconded, and the motion was carried unanimously. On the motion of the chairman, seconded by Mr. Lil Tze San, Mr. Li Yuk Tong was appointed liquidator. In the absence of a reason for this liquidation, we are left to our own imaginings to ascribe a cause!

THE EFFICIENCY OF THE STEAM ENGINE.*

BY E. C. DE SEGUNDO, A. M. I. C. E.

The steam engine and boiler have been brought to a degree of efficiency upon which there appears to be little room for improvement. There are authentic cases of boilers in which 85 per cent. of the heat energy of the coal consumed reappears in the steam raised. The Carnot efficiency of the steam engine itself has been brought to nearly 28 per cent., and the mechanical efficiency to 95 per cent. It may fairly be assumed that steam pumping plant can now be designed which will work at an absolute efficiency of $0.85 \times 0.23 \times 0.90 = 17.6$ per cent., that is to say, that 17.6 per cent. of the heat value of the fuel will reappear as available mechanical work done by the engine. At first sight this does not appear to be a brilliant result, though, when analyzed, it will be found difficult to improve upon in the present state of our knowledge. The main source of wasted energy is, of course, in the loss of the latent heat of vaporization of water. Although 966 thermal units must be expended in converting a pound of water into a pound of steam at atmospheric pressure and 212° F., this heat is lost as far as conversion into mechanical energy is concerned. It is the price nature makes one pay for the privilege of being able to convert water into steam, and so utilize its expansive characteristics, and so far every effort to turn this 966 thermal units per pound of steam to account has failed.

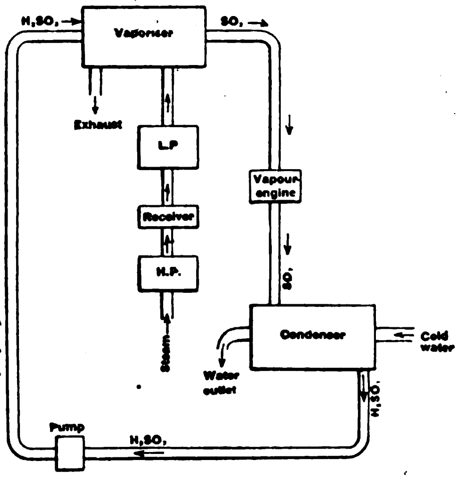

FIG. 1.

The question that naturally rises to one's mind then, is whether it would not be more practical to use steam gas and not saturated steam for the purpose of the steam engine. Unfortunately, however, nature has some very good reasons why this should not be carried out practically, and the price that she exacts for using steam as a gas is even higher than before. Steam engine builders have attempted to meet nature half-way by superheating steam to some extent on its way from the boiler to the engine, and very marked economy has been attained in this way, but nothing like the saving that would be effected if the latent heat of vaporization could be utilized. An interesting attempt to convert the latent heat of vaporization into mechanical energy has been made by G. Behrend, of Hamburg, and Dr. Zimmermann, of Ludwigshafen, who have jointly worked out the details of an engine, the general arrangement of which is shown in diagram in Fig. 1. The engine was described by

* From the "Electrical Review," London.

Digitized by Google

Prof. Josse at the recent centennial anniversary of the Royal Technical School at Charlottenburg. It is a compound engine indicating 34 hp. with a consumption of steam of 18.96 lbs. per ihp. per hour. The steam from the low pressure cylinder passes into a vaporizer which is practically a surface condenser, in which H_2SO_3 in passing through the tubes is converted into SO_2 by the heat of the exhaust steam from the low pressure cylinder circulating round the tubes. The SO_2 then passes to the auxiliary engine, as indicated by the arrow, where it does work, and then flows to the condenser, where the SO_2 becomes H_2SO_3 by contact with the cooled surfaces of the tubes. Thence the H_2SO_3 is pumped back to the vaporizer.

The auxiliary engine in the combination referred to by Prof. Josse, indicated 19 hp., being an increase of horse-power per pound of steam consumed of 56 per cent. In other words, 18.96 lbs. of steam per hour would now correspond to 1.56 hp., or 12.13 lbs. steam per ihp.-hour.

Experiments showed that for every 33.169 lbs. of steam passing through the main engine, 1 hp. was developed in the auxiliary engine.

If the temperatures between which the SO_2 vapor works be 140° F. and 67° F., the pressure would be between 147 lbs. per square inch, and 34.5 lbs. per square inch, hence pressures equal to boiler pressures are readily obtainable.

The Carnot efficiency would be about 26 per cent., that is to say, the engine would theoretically be capable of turning 26 per cent. of the heat supplied to it into work. As it yielded 1 ihp. for one hour, for 12.13 lbs. of steam, it turned into work nearly 18 per cent. of the heat supplied, hence the relative efficiency of the combination, roughly estimated, would be

$$\frac{18 \times 100}{26} = \text{nearly 70 per cent.}$$

This is not so good a result as that obtained from a quadruple expansion pumping engine set up at a station of the Pennsylvania Water Company, near Pittsburg, and which was tested by Prof. Thurston in September, 1898. The efficiency of this engine measured against the perfect engine of Carnot was 84 per cent.

In this latter case the increase of efficiency was obtained mainly by the elaborate system of feed water heating introduced, and while no doubt, applicable with success to a slow-speed engine such as the one referred to, it is not likely that the principle could be successfully carried out in connection with steam engines of the ordinary commercial type, or with high-speed engines. The suggestion of an SO_2 vapor auxiliary engine is therefore interesting, in that it effects what all attempts at increasing the efficiency of the steam engine aim at, namely, an increase in the range of the temperature through which the working fluid passes by lowering the lower temperature.

As far as can be gathered, this SO_2 auxiliary engine has not yet taken a practical form. Possibly trouble may be experienced by the formation of H_2SO_4 during the cycle, which would, of course, be disastrous. Possibly, also, the extra space required, and the necessary duplication of all the essential parts of a steam engine, have been found to introduce more complication and involve greater disadvantages than are counterbalanced by the increase of power obtained.

Syracuse, N. Y., is about to dispose of the last horse car line in that city. Nearly all the roads are now run by electricity.

PARIS EXHIBIT OF THE HELIOS COMPANY.

BY FRANK C. PERKINS.

The engine and dynamo exhibited at the Paris Exposition in the Palace of Electricity by the Helios Company are well worthy of attention. The largest of these alternators that have been furnished so far are those for the electric central station of Cologne, having each diameter of 8 meters or 26 feet. Six alternators of this type direct connected to their prime movers are shown in Fig. 1. The Paris alternators weigh 50 tons each and operate at 2,200 volts at 70 revolutions per minute. The total distance from the lowest point of the foundation to the top of the generator is 13 meters or about 44 feet.

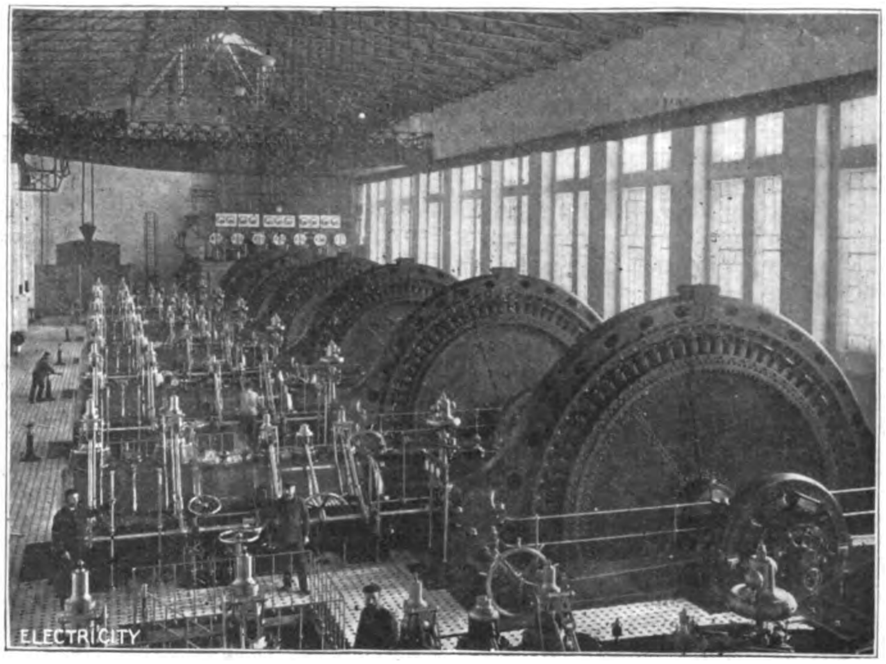

FIG. 1.—HELIOS ALTERNATORS WITH REVOLVING FIELDS.

Near the engine and dynamo there is placed the continuous current dynamo, Fig. 2, serving for the excitation of the poles of the large dynamo. This exciter represents the modern form of continuous current generators, and is, like the large alternator, coupled directly to a steam engine, in different ways however, as the large dynamo. Several small dynamos have been placed in the neighborhood; they are not at work. The same may be said with regard to some electromotors for three-phase current and for continuous of this current. Several iron-clad motors specially constructed for wet rooms are shown opened and closed: they have so far given full satisfaction under the most trying circumstances. The principal feature of these motors is their high starting torque. The main part of the Helios exhibition of three-phase (Drehstrom) motors and transformers is working in several places in the large machine hall; the visible part of the exhibition only contains two alternate current transformers of 5 and 25 kilowatts output of the type first used for St. Petersburg.

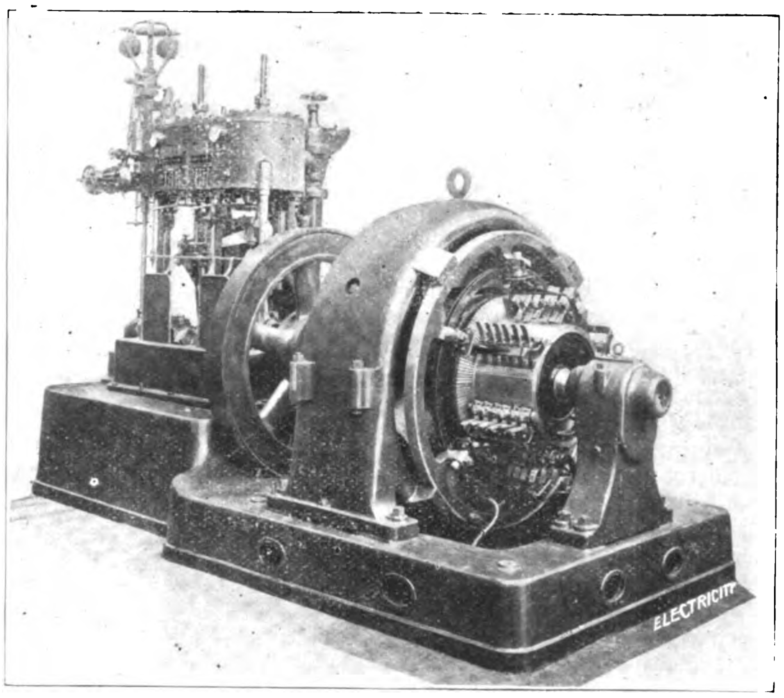

FIG. 2.—HELIOS DIRECT CURRENT EXCITER AT PARIS EXPOSITION.

At the wall there is fixed one of the Helios alternate current meters provided with the

latest improvements and representing one of the best known types of meters. Aside of it, there are two test curves showing the correctness of the meter for different loads, and two models of the peculiar systems of lighting that have been employed by the Helios Company for the illumination of the Kiel, or Kaiser Wilhelm Canal and of the city of Rosenheim in Bavaria. Another interesting group is that containing modern switchboard devices, whose construction has required a considerable amount of labor, experience and attention in order to make them precise, reliable and strong.

ADVANTAGES OF RECORDING WATTMETERS ON SWITCHBOARDS.*

BY W. WORTH BEAN.

For the past three years watt recording meters have been used on the switchboards of the St. Joseph & Benton Harbor Electric Railway & Light Company, and the following advantages may be summed up from their use:

In the first place it enables the central station manager to make contracts with the coal dealers and mine owners in an intelligent manner, because the output from the station in kilowatts is shown every twenty-four hours, thereby giving each grade or quality of coal an equal test. No coal dealer can laud the virtues of his coal above that of his competitor. It puts at rest all vague statements concerning the quality of the coal, making it stand upon its actual merits and tests, and showing to the central station manager whether it is best to use mine run, screen lump or slack, and proving which can be used to the best advantage in each particular station.

Next, the fireman understands before using the coal that the meters on the switchboard are going to give actual results of his firing, making superfluous any statements of the fireman with regard to inferior coal or heavy loads.

It will further show that the employe who produces the best results with the least amount of coal consumed, is the one who should draw the most money. Then give the proper fuel and firing, a test for engines is necessary in order to show that the engineer is not responsible for any possible waste.

The electrician must see that the proper speeds in his generators and dynamos are kept up by having a sufficient steam pressure at all times, the engineer furnishing it to him for the varying loads. Then with the proper connections from machine to switchboard, current is furnished at the most economical price to the meter. The given amount of current leaving the switchboard being known to the station manager, he is enabled to tell if his current is wasted in motors, transformers, lamps or wire connections.

A further advantage to be derived from meters, would be to have all central station switchboards equipped with them, where records could be taken monthly, and comparisons made with plants in that locality for the purpose of showing still greater economy, if possible.

I consider the meter on the central station switchboard a most indispensable instrument, because properly looked after it is conducive to the greatest economy in fuel, in firing, in engine and dynamo, all of which combined will produce the necessary economy at the meter.

* Paper read at the Northwestern Electrical Association Convention, Waupaca, Wis., June 26-28, 1900.

The cost of meters is a mere bagatelle as compared to the saving in coal alone.

After my experience with them, I would strongly advise that all central stations adopt meters on their switchboards for their own advantage and economy.

DISCUSSION.

Mr. W. B. Baker of Waupaca—What is the usual discrepancy between the wattmeter on the switchboard and the combined wattmeter on the system?

Mr. Bean—Our plant is a combination plant, and we are cursed with flat rates, as well as having meter rates, and I could not give you a proper answer to your question, because part of my current goes to a flat rate load, and part to a meter rate load.

Mr. Baker—Under those circumstances then how would you detect a loss on your line?

Mr. Bean—That can be detected, but the important thing is to get the current started out of the station in an economical manner.

Mr. Baker—Do you know of any station that is using meters with its customers, and also using a wattmeter at the switchboard? And if so, what is the usual percentage of difference?

Mr. Bean—I do not know personally. Our plant is a combination, railway 500 volts, motors 500 volts, alternating current and distributed from one city to another, and incandescent, alternating arcs and old multiple arcs and series, and long-burning arcs. That is our combination plant and to give the difference between the station switchboard wattmeter and the customers' wattmeters would be exceedingly difficult.

Mr. Baker—Do you employ the wattmeter on your railway system too?

Mr. Bean—Do you mean on each car or on the switchboard?

Mr. Baker—On the switchboard.

Mr. Bean—I use a wattmeter for every machine in the station. I have a 50 T.-H. machine, a 75 T.-H. machine, 120 Brush machine, all arc; one 1,000 alternator, two 2,000 alternators, three 250 compound-condensing engines. Two engines are connected to the line shaft 57 feet; one of these engines on the end of the line shaft is connected to an M. P. 90 generator old type, and one 225 kw. generator new type, 425 revolutions, and a meter for each circuit is on the switchboard, showing the output in current from the station.

Mr. F. A. Copeland of La Crosse—The plant with which I am connected keeps the output in amperes at the station, and we also have the record on consumers' meters. We have a few contracts and have a meter on them also, so that we know the exact amount of current that we put out, and the exact amount of current that we receive pay for. The loss will run anywhere from 20 to 35 per cent. Our loss averages about 27 per cent., which is, I believe, a fair average showing. As I understand it, we meter everything, whether on contract or not. So if a man is on contract we know just exactly what he is using. We have no recording wattmeter at the station. We keep it the old-fashioned way by putting down the number of amperes every 15 minutes, and come pretty close to it that way. We do not get it perfectly accurate but pretty close.

Mr. Bean—Do you use direct current?

Mr. Copeland—Yes; the Edison three-wire system, all of it.

Mr. Bean—No railway or generator?

Mr. Copeland—No railway and no series arc lighting.

Mr. Bean—A railway generator will be running along at 50 amperes and perhaps in minutes will jump up to 400 or 500 amperes. This talk of mine is simply a personal matter with me. I merely want to get the experience of the other members, and I am not prepared to talk about the experience of other plants than my own.

Last Sunday we used 11 motors and 4 trailers and handled 2,000 passengers more than the Sunday before, and it took 10 pounds less steam last Sunday than the Sunday before. The first Sunday the engines were being pulled very hard, and the engineer in the station had considerable trouble about his steam and he reported it to the superintendent, and as each man left the barn last Sunday he notified him to handle his car carefully and take current carefully, and if a circuit breaker should fall, to have the cars start alternately, and the result is what I have stated. I have not as yet taken the coal test.

Mr. Copeland—What do you mean by ten pounds less steam?

Mr. Bean—If 100 pounds carried the load Sunday before last, then we carried 2,000 more last Sunday with 90 pounds of steam.

In regard to coal I would say that we can produce as much steam with ordinary slack coal at $1.00 or $1.50 (under our conditions) as we can with lump, within 5 per cent., and so we use slack in our plant. We run for two towns, 24 hours a day. We run cars commencing at 6 a.m. in the winter, and 5:30 in the summer, running until 12:30 a.m. We have an engine running all the time, generators running 19 hours and a dynamo running 24 hours a day.

Mr. Louis A. Ferguson of Chicago—We found on trial in our larger plant in Chicago that the wattmeter system suggested was unnecessary, as our load is very regular and practically a full load at all times. But I can very readily see that in railway plants where the load fluctuates from to 400 or 500 amperes in a very short time, watt-meters would be exceedingly useful, and in fact necessary to get an accurate determination of the load.

There was one question asked by a gentleman here a few moments ago regarding the difference in the readings of the station recording wattmeters and the wattmeters on the customers' premises. In the large Edison stations it is found that the difference is practically 18 to 20 per cent. That is, there is a loss of 18 or 20 per cent. of energy which is unaccounted for. Of course it is partially due to the loss on the line and the balance is unaccounted for. In alternating stations where the ampere meters and voltmeters are used on the switchboard, the difference may be as high as 50 per cent., but with wattmeters on the switchboard and at the customers' premises it is not so large of course.

Mr. Copeland—You would not consider it very bad then to lose from 25 to 30 per cent. for a small station, covering a pretty large territory, using the 3-wire system over a territory 1¼ to 1½ miles square.

Mr. Ferguson—I should think in a direct current station 25 per cent. would be as large as you should have. Otherwise you might suspect some one of stealing your current from you.

Mr. Copeland—We have gone as low as 16 and as high as 30 per cent.

Mr. T. F. Grover of Fond du Lac—Have any of the gentlemen made any experiments far enough so that the central stations generally could get together and know how many watts per pound of coal they can produce in the dif-

Digitized by Google

ferent stations? Most of the gentlemen with whom I have spoken and who use wattmeters do not appear to keep those records, although I know of some of them that do; but I think that if there was a record kept by all stations of the watts per pound of coal, a great many of us could find out whether we were throwing a lot of coal away or doing good with it, and I would like to ask Brother Bean if he has figured out the watts per pound of coal.

Mr. Bean—I have the records at home.

We have a street lighting contract with St. Joseph, and one with Benton Harbor, and meter records for both towns. We have a commercial arc circuit for both towns, and a meter on each circuit. I have those records in my station and I hope by the first of July to publish in a general way just what you want.

Mr. Ferguson—In Chicago for the past four or five years we have been keeping the cost per kilowatt hour of the fuel in all of our stations, keeping it daily, so that we know every morning just exactly what it costs per kilowatt hour at any given station the day before. In that way we are enabled to follow very closely the operation of the station. In most of our stations we have recording wattmeters on the switchboards but not in larger stations, for the reason that the ampere-meters and the voltmeters read so closely to the recording wattmeters that it is unnecessary to use the wattmeters on the switchboards.

We made an interesting contract two years ago, for a suppy of coal for one year, and in that contract we were guaranteed that the cost per kilowatt hour of our fuel should not exceed a certain amount. Now if we could buy our coal on that basis all the time we would be in splendid position. Unfortunately for us, one year was sufficient for the coal operator and we have never been able to make a contract like that since. (Laughter).

Mr. Grover—We do keep a record every day, as Mr. Ferguson says, of not only the watts per pound of coal, but the cost of coal per kilowatt. The size of Mr. Ferguson's station of course would cut it out of our list, but I would like to be able to find the smaller stations that would compare with ours, and I think if we could get together on this point it would be an advantage all round, because we could all see where we were losing; and I should say that if one of our small central stations running on similar conditions with another could get 200 watts out of a pound of coal, and the other station only half that, that that information would be very interesting.

Mr. Copeland—There is something that Mr. Grover wants to know, and I presume that he is prepared to answer the questions he is asking of others, viz., what does it cost per kilowatt to generate that current, what kind of engines and what price of coal.

Mr. Grover—Our coal varies a great deal in price, and in fact we have to job it wherever we can, but I think on an average we will run about 8 mills a pound with condensing engines. We have both types of boilers. We have been using the ordinary tubular boilers, but are now installing different boilers. One of our engines is compound, high-speed, and we have a cross compound, low-speed tandem. We use Youghiogheny screenings for which we have paid all the way from $1.85 to $3.65.

Mr. Copeland—I am using Youghiogheny lump coal and we have four engines. One of them is a compound condensing. That is only run from the lighting up time in the evening till about 10 o'clock. The balance are just straight engines to run condensing. Our coal is $4.40, and it costs us just about a cent now. If the engines were all compound we would get down to about 8 mills.

Mr. Frank McMaster of Chicago—In arriving at these figures do you take into account the expense of having one of your compound condensing engines lying idle, as compared with a high-speed engine.

Mr. Copeland—We estimate the cost under all conditions for a length of time—not for an hour, but, say for a month.

Mr. Ferguson—If Mr. Grover will refer to the proceedings of the National Electric Light Association of two years ago, he will find there a paper showing the statistics which he wishes to obtain.

Mr. Grover—I saw that article, but I believe it referred mostly to the Eastern stations, and the conditions are somewhat different in the Northwest. The article that I saw did not give the names of the stations, and, consequently, you could not determine whether they were Eastern stations, or whether they were stations in the Northwest, and as they burn hard coal in the East principally, and in the western part of Pennsylvania and Ohio soft coal, at a very low price, I did not think it was quite the comparison I would like to have.

ALTERNATING CURRENT GENERATORS.*

BY H. G. REIST.

Since the general introduction of alternating current followed the extensive use of direct current machinery, it was very natural that the same type and method of construction used in the latter should be adopted, and revolving armature generators resulted. With the small sizes which were at first built and the moderate potentials of that time, these machines were satisfactory and there was little reason for any change: but with the development of the art, various improvements and modifications suggested themselves, one of the most important being the introduction of machines with revolving fields. These machines offer many advantages of construction and operation, and are rapidly displacing the machines of the older form.

The regulation of the potential of alternating current machines has always been an interesting problem and one for which a solution has been eagerly sought for some years. There have been various steps in solving this problem that may be briefly traced with interest. The first machines were separately excited, but it was soon found that some form of automatic regulation was desirable, and methods of compounding were devised. This was done either by rectifying the line current or a current derived from a series transformer in the main line. For a load with a uniform power factor, this method of regulation is quite satisfactory, but with a mixed load of lighting and induction motors it leaves much to be desired, since if the machine is adjusted to regulate for a load of one kind, it will either over-compound or under-compound for the other condition. If the machine is adjusted to give the proper potential at the end of a line with a lighting load, it will be too low if motors are added. If adjusted for a motor load, it will be too high if lights are operated alone. It was with a view of rectifying difficulties of this sort that the compensated machine was devised. This was so named because it compensates or equalizes for loads of variable power factor, and will give the potential that the machine is adjusted for—whether the load is non-inductive or whether it is an induction motor load or a mixed load, i.e., you may have a load consisting entirely of lamps and the machine will compound to 2,300 volts at full load, or you may have a motor load and the same potential. The same is true if the load consists of half lights and half motors—always with a given load the potential at the generator will keep constant. This is a feature of very great value as will be appreciated by all who have operated alternating current apparatus.

As stated above, the earlier alternating current generators were usually built of the revolving armature type, the first machines having the winding placed on the surface of the smooth core, but later it was placed in slots of the then so-called iron-clad armature. This allowed of the use of entirely enclosed armature coils, thus making possible an insulated covering of a quality unknown in earlier dynamo construction, but the supporting of the coils on the revolving armature either by bands or by clamps or shield-rings of various sorts was always a troublesome matter. The collector-rings for the higher potentials have also been a detail to which there was considerable objection, both on account of the difficulty of constructing rings satisfactorily insulated for higher potentials and also on account of danger to the attendant. It is unusual to find machines having a higher potential than about 3,300 volts of the revolving armature type, largely for this reason. For very low potentials, on account of the large current to be taken from the collector-rings, the revolving armature machine is also not suited.

ARMATURE.

With the introduction of revolving field generators, many difficulties that are inherent to the revolving armature machines have been overcome and a construction much more satisfactory in every way has become possible. We are now enabled to produce machines which have stationary armature coils which require comparatively little fastening in the armature and which may be wound for all potentials from the lowest to 12,000 volts or more, with entire satisfaction. In the case of high potential machines, the terminals are usually entirely enclosed so that it is impossible for the attendant to be injured by them either from carelessness or accident. On low potential machines the feature of having stationary armature coils is just as desirable since the current is led through stationary parts only and does not have to pass through brushes. The coils of the armature are wound directly into their final shape and then filled with insulating compound. The insulation consists of a number of layers of tape, the number varying with the potential of the machine, each layer being carefully coated with varnish, thus making a coil insulation practically airtight and water-proof. On high potential machines the insulation is so important a matter that it is usual to put only one coil in each slot, and also to reduce the number of slots per pole so that the total percentage of space occupied by insulation is not too great. This produces a winding in which there is more than one shape of coil. On smaller machines the so-called "barrel" winding is generally used, because such machines are built of lower potentials — generally 2,300 volts. In this case only one kind of coil is used, and

*Abstract of paper read at the Twenty-third Convention of the National Electric Light Association, Chicago, Ill., May 22-24, 1900.

Digitized by Google

when the coils are placed in the machine they produce a very symmetrical structure. The armature coils are held in place by wooden wedges which are easily removed and form a thorough protection for the coils in case foreign matter should accidentally find its way into the air gap. The advantages of stationary coils are very great as they are not subject to injury from mechanical strains produced by centrifugal force. There are no bands, so their removal is a very simple matter, and lastly, the ends are free to the air on all sides instead of being bound down to a supporting head. On larger machines it is usual to arrange the armature so that it may be slid on rails in a direction parallel to the shaft until the armature and field are free from each other and either part is rendered accessible for repairs or cleaning. The extra space required for this purpose is usually very small since a part of it is always necessary for the collector-rings supplying current to the revolving field. The armature core is usually built up of the best quality of thin sheet-iron carefully annealed and the laminæ insulated from each other by paper or japan.

REVOLVING FIELDS.

The revolving field structure is a detail which has received some of the best thought of electrical designing engineers for the past few years. The pole pieces are made of punchings of heavy sheet iron about $\frac{1}{16}$" in thickness, with a composition end plate, the whole fastened together by means of rivets, or in some cases with bolts. These pole pieces are fastened to the field ring by two methods—in belted machines by means of a projecting dovetail on the pole piece which enters a groove in the field ring, and is secured by keys with a very slight taper, so that by light blows of the hammer on this key a very secure fastening is obtained. In the case of slow-speed machines where the centrifugal force is less and the diameters of the field rings greater, more lightness and sufficient strength is obtained by fastening the poles by means of bolts. Except in the very small machines, the field copper consists of a flat ribbon wound on edge, so that the coil is only one layer in depth, the outside surface of which is bare. Every turn is thus exposed to the surrounding air, and it is impossible to have a coil warm on the inside. The surface of the coils being flat gives large bearing of the turns of the coil on the insulation, thus not allowing any opportunity for the windings to shift on each other and short-circuit. The turns are insulated from each other by sheets of paper. These coils form a striking contrast and improvement when compared with field coils of machines built heretofore.

FLY-WHEEL ALTERNATORS.

By somewhat enlarging the diameter of the armature, the yoke of the revolving fields can readily be made large enough to serve as a fly-wheel for the generator. This, while making the cost of the generator somewhat greater than if a separate fly-wheel is used, still offers many advantages so that it will probably soon be the usual construction of the engine-driven alternators. Some of the advantages of this form of construction are that the shocks due to sudden changes in load are directly transmitted from the pole pieces to the fly-wheel mass, and not as with the older construction, through the arms of the dynamo spider, through the shaft, then out through the fly-wheel arms, the total weight of the parts on the shaft may be reduced, since only one hub and spider is required; the length of the shafts may be greatly reduced, thus also reducing its diameter, and the size of foundation and space occupied by the machine. This construction moreover makes a more compact and symmetrical piece of machinery than if a separate fly-wheel is used.

COMPENSATED GENERATORS.

The above general remarks on revolving field generators apply equally to the line of compensated machines which has been developed by the General Electric Company, and to which I would like to call your attention. These machines so far have been built belted only, and the exciter mounted on the shaft of the revolving field, and in their design all the best features of years of experience have been incorporated.

EXCITER.

The exciter of one of these machines has the same number of poles as the generator. They are wound for 60 volts on smaller machines and 125 volts on larger ones. The poles are stationary, and the armature revolves as is usual in direct current machines. The construction of the exciter is the same as in direct current multipolar machines only on account of the small energy necessary for exciting, the parts such as the pole pieces and armature coils are very small. There are three taps in the exciter armature which are connected to collector-rings on the shaft—on the smaller machines on the outside of the bearing and on the larger ones, between the bearing and the armature. The exciter is placed within the shield of the alternator which allows a construction to be used that does not destroy the symmetry of the machine and affords protection for the exciter. For direct-connected machines the exciter is mounted on the outboard bearing of the engine and is driven by means of enclosed gears. In this way an exciter may be used with a smaller number of poles than is used on the generator.

BRUSHES.

The machine is entirely equipped with carbon brushes and in all cases there are at least two brushes in multiple so that any brush on the machine may be examined, cleaned and replaced while the machine is in operation.

BEARINGS.

The bearings used in these machines are the usual spherical self-oiling, self-aligning bearings made of a heavy cast-iron sleeve lined with anti-friction metal. The bearing next to the pulley is made especially large, both to ensure stiffness of the shaft and to avoid wear and heating. The small bearing next to the exciter has only very light pressures on account of the long distance between bearings. The arrangement which has been adopted on these machines allows the bearings to be placed far apart—yet keeping the machine as a whole very compact, which is a very desirable feature on machines with two bearings. The oil rings of all the larger bearings are made split, so hat they can be readily removed without taking the shaft out of the bearings if it is desired to do so.

METHOD OF COMPOUNDING.

It is well known that when the load on an electric generator, direct or alternating, is increased, the potential will drop unless the field excitation is also increased. This is due to the resistance of the armature, the inductance of the armature, and the reaction of the armature on the field poles, the latter reducing the amount of effective magnetic flux. The potential at a distant point, where the current is used for lights and motors, falls even more on account of the resistance and inductance of the line. To compensate for this D.C. dynamos have been compounded by passing the main current through series coils on the poles and so adjusted that the potential at the machine increases with increasing load. On alternating and multiphase machines the same result has been obtained by rectifying the main or an induced current, and using it for the same purpose; and, except for a slight increase in complication, the method is just as effective as on D. C. machines, so long as the alternating current is in phase with the potential, which unfortunately is rarely the case in ordinary operation, since partly loaded transformers and induction motors produce a lagging current which requires a greater field excitation to produce the normal potential. Thus in all types of alternators heretofore designed the compounding required for non-inductive load has been entirely insufficient for inductive conditions. With the loads that ordinarily have to be provided for on alternating current circuits, there are wide variations in power factor, especially in case where considerable proportion of the load is in motors. Therefore, the introduction of automatic means of field adjustment for all kinds and degrees of load is of the greatest practical value. This is what is being obtained by this new method of excitation, which is based on a radically different principle from anything that has heretofore been employed and gives an automatic compounding far superior in results from that which can be obtained by any other known method, and at the same time there is nothing but the simplest and most reliable mechanism used, in fact without any mechanical change or adjustment. The devices by which this result is accomplished are mechanically simple. The shaft of the alternator which carries the revolving field also carries the armature of the exciter. The exciter has the same number of poles as the alternator, so that the two operate in a synchronous relation. Besides being connected to the commutator, which delivers current to the field of the alternator and to the field of the exciter, the winding of the exciter armature is connected to three collector-rings. Over these collector-rings it receives current from one or several series transformers inserted into the lines leading from the alternator. This alternating current passing through the exciter armature, reacts magnetically upon the exciter field in proportion to the strength and to the phase relation of the alternating current. In consequence thereof the magnetic field, and hence the potential of the exciter, is due to the combined effect of the shunt field and the magnetic reaction of the alternating current. The connections between the armature of the two machines are so made that the poles induced in the exciter armature are somewhat ahead of the exciter field magnetization, but still so that they will assist the field magnets. The result is that with increasing current the current passing through the exciter armature strengthens the exciter field and thereby the field of the generator. If the current lags, as under an inductive load, the poles produced by the alternating current in the armature come more nearly in line with the exciter field poles, thus strengthening the field more with a given line current. This is so adjusted as to give the necessary rise of exciter potential as the non-inductive load increases and without other adjustment to give a greater rise of exciter voltage with additional inductive load.

USES OF MACHINES.

These generators may be used very satisfactorily as single-phase machines for a lighting load on two lines and motors placed between the lighting terminals and the third wire. In this case the machines are adjusted so as to give a correct potential on the lighting circuit, whether the load is due to a lighting load or to a motor load. For small stations this is a very desirable method of installing a plant as only a single lighting circuit is necessary, and the attention given to the machine can be reduced to a minimum. A second method of installation which has found considerable favor of late is to install a 240-volt generator, which is Y connected, and which has a fourth wire brought out from the common connection. The lights on a machine of this sort are placed between the neutral wire and the three terminals of the machine, arranging the lamps so as to approximately balance the load. This, however, is not very essential as the unbalancing effect with this arrangement is almost negligible. For factory distribution work this is a very convenient arrangement, as no transformers are needed, and the power and lights are distributed from the same circuits with a minimum amount of copper, and with almost perfect regulation. The usual method of distributing a general system of lights from three-phase generators is to transmit the current over the line by means of three wires, and to transform with the transformer primaries connected delta and the secondaries Y, connecting the Y connections with a neutral wire, and the whole to a system of secondary mains, and approximately balancing the lights in each important installation. In this way a very efficient distribution of the power is obtained with a minimum amount of copper and the generators are used to the best advantage as all branches are fully loaded and motors can be installed at any point. In large installations it is usual to have potential regulators in each branch to take care of slight unbalancing that may occur. These regulators may be made to operate automatically, keeping the constant potential at some distant distributing center, if it is so desired, or at the station. Two general types of potential regulators are used for this purpose. The magnetic regulator, which is used in smaller sizes up to about 6 kw., and the compensator regulator, which is used on large sizes. In connection with the compensator regulator, an ingenious switch has been devised which snaps from point to point, carrying current momentarily through an arc which, however, is interrupted immediately when the second contact is made.

Another use to which this machine can be put is in the operation of series enclosed arc lamps, which are so largely coming into use at the present time in connection with the constant current transformers. Here the load is quite inductive, and it is hard to operate with incandescent lights without hand regulation, but the machine takes care of such loads perfectly.

In conclusion I will say that I have seen a 75 kw. belted machine start a 50 hp. induction motor belted to another machine, so that it had a considerable load with a fluctuation so brief on the lights as not to be noticed unless it was especially looked for, the voltmeter needle swinging perhaps five volts for a very small period of time—say $\frac{1}{10}$ of a second, coming back again to its normal voltage, or in fact, to a higher potential than before, on account of the compounding, in a surprisingly short time. On observing the tachometer on the generator under these conditions, it was found that it also fluctuated, possibly to the stretching of the belt as the load was put on; thus my conclusions are that there would be actually no fluctuation under these conditions with constant speed.

POWER SUPPLY BY SINGLE-PHASE MOTORS.*

BY T. P. WILMSHURST,
Borough Electrical Engineer, Derby, England.

NOTE.—In the following paper the abbreviations D.C., A.C. and S.P. refer to direct current, alternating current and single-phase respectively.

The principal objections which are usually urged to the distribution of electricity by alternating currents are:

(1) That alternating current is less economical than direct current working.

(2) That alternating arc lamps are inferior to direct current lamps.

(3) That single phase motor working is impracticable.

While the writer is prepared to admit that in some instances objections (1) and (2) are valid, and (3) also in a modified degree, he holds the conviction that they originate rather from unsuitable arrangements or want of appreciation of the varied requirements of electrical supply on the part of the designers, than from any inherent insuitability of alternating currents.

He is led to this conclusion from a study of the cost's analysis of various towns, from which it appears that the following results have been achieved in A.C. stations:—full costs of .25d., .3d., and .32d., and works costs of .78d., 1.02d. and 1.16d., all on outputs of less than a million units per annum. As regards objection (2) the writer would only remark that those members of the Association who visited Cheltenham during the last Convention would hardly deny that the A.C. arc lighting there left little to be desired.

Coming to objection (3) the object of the paper is to show what is the present position of the S.P. motor in the struggle for existence.

In nearly every town, certainly in all manufacturing towns, there will in the future be an enormous demand for motors when the cost of supply is sufficiently low and the public appreciate the advantages of electric driving. Since the S.P. system has been adopted in nearly 100 towns in this country, the question arises, how is this demand to be met?

(1) Shall we change over our whole system to D.C. as is proposed in one or two cases?

(2) Shall we lay down D.C. plant and mains for the motor supply, leaving the A.C. plant to supply current for lighting?

(3) Shall we supply S.P. motors from our ordinary A.C. plant and mains?

(4) Shall we lay a special A.C. motor net-work supplied from the A.C. plant?

(5) Shall we lay down multiphase plant for power supply?

The writer has come to the conclusion that while cases do exist in which by reason of abnormal frequency, excessive armature drop in the generators, or other causes, the good working of A.C. motors is rendered difficult, in the majority of cases, under reasonably favorable conditions, the inferiority of the S.P. motor to the D.C. or 3 phase motor is not sufficiently marked to justify the laying down of special plant.

It is obvious that method (3) has the great merit of simplicity and low cost.

It is a matter of common knowledge that at the present time, while the proportion of motor to lighting load on D. C. circuits is small, it is still less on A.C. circuits, and it is a matter of interest to study the causes of this.

The two principal reasons appear to be the difficulty of successfully competing in cost with gas and steam engines and the fear that the use of motors will injuriously affect the steadiness of the light. It is a self-evident truth that the more the day load can be increased the lower can the charges be made. An examination of the power charges in various towns reveals the curious fact that these charges vary from 8d. per unit down to 1d., and inasmuch as the cost of production can hardly vary within such wide limits, it would appear that the size of these charges is a measure of the appreciation by the engineer of the value of a motor load. In the case of a gas engine a brake horse power can be obtained for about 1d. per hour; in the case of electric motors, therefore, it is necessary to bring the cost down to 1d. to 1¼ d. per unit before we can hope to enter into successful competition.

The second point is of vital importance and merits careful consideration.

The principal causes which are likely to disturb the supply voltage are:

(a) Bad regulation in engines, alternators and transformers.

(b) The use of small generating sets and transformers.

(c) Defective working of the motors themselves.

(d) The adoption of a high frequency.

The first (a) is a prolific source of trouble. An armature drop of 20 per cent. to 30 per cent. even on non-inductive loads is by no means uncommonly found in this country. Why these abnormal drops of pressure have been tolerated it is difficult to say. It is obvious that the starting of a large motor on mains supplied by such a machine must cause an instantaneous drop of pressure which no amount of switchboard manipulation can prevent. When one considers that in a D.C. station an armature drop of 6 per cent. is rarely exceeded, is it any wonder that A.C. motor working on such circuits has been discouraged?

A similar abnormal drop may also be found in transformers which have been designed for a lighting load only. It is quite possible that a transformer with heavy magnetic leakage may have three or four times the terminal drop on a motor load which it would have on a lamp load. It is therefore obvious that all transformers before being sent out should be tested on an inductive load in addition to the non-inductive load test. The writer has adopted the practice in specifying for transformers that when tested on a non-inductive load the drop shall not exceed 2 per cent. and not more than 3 per cent. when tested on a load with a power factor of .75.

(b) The question of the size of the day load sets is one which will right itself as the motor load increases, since the possibility of any single motor disturbing the supply will diminish as the number of motors increase, and this may therefore be classed as a temporary difficulty only.

(c) The chief defects are heavy starting current and low power factors. The starting current in a S.P. motor need not necessarily be abnormal, though undoubtedly this often is the case, and it is surprising that A.C. engi-

*Paper read before the Municipal Electrical Association.

neers do not more rigorously insist on the starting current of motors being kept down. It is purely a matter of what starting torque is required, and it can be brought as low as two-thirds of full load current or less by suitable arrangements.

(d) A high frequency was adopted in the early days when it was common practice to install small transformers in houses, with a view of keeping down the iron losses, the designers loosing sight of the objection to a high frequency in view of motor working. It is well known that with a low frequency, a motor has the advantage of higher efficiency, higher power factor and smaller starting current.

The writer trusts that he has shown that the prejudice against the single-phase motor has its root not in any inherent defect in the motor but in the insuitable nature of the appliances used.

It will be seen that direct-current engineers would have equal cause to complain of their motors if they tolerated the defects in their systems which alternating current engineers accept as inevitable.

Imagine a D. C. engineer being first hampered with a 25 per cent. drop in his armature, then a drop in his feeders and distributers corresponding to the drop in the feeders, distributers and transformers (the latter wound for non-inductive loads only), allowing motors to be started from rest by means of a resistance so imperfect as to pass double or treble the full load current, and we should not be surprised at his complaining of the disturbance caused by his motors.

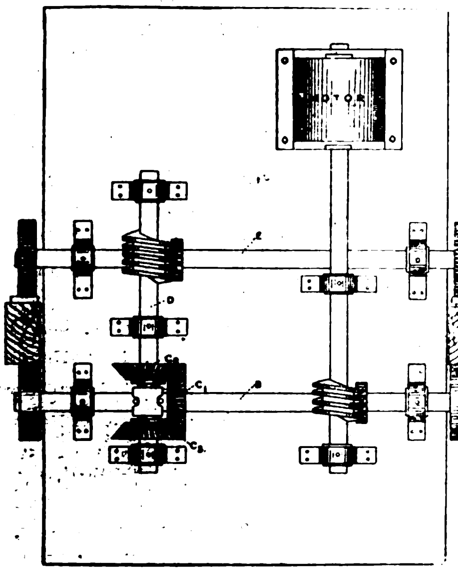

FIG. 1.

Consider now the A.C. engineer with the added losses caused by a power-factor less than ninety and we see his difficulties in the face of insuitable plant.

The writer believes that it would be well worth while to go to the expense of re-winding alternators with these abnormal drops, to use only transformers rated on a power basis and in extreme cases to bring down the frequency to a reasonable value.

Exception has been taken to the S.P. motor owing to its alleged inability to start against a load. This allegation is quite unfounded, as this condition can be complied with, but at the expense, of course, of starting current.

It appears to the writer that this point has been labored too much, as there are few cases in which a fast and loose pulley cannot be arranged. Moreover this defect has not prevented the enormous use of gas engines, which, so far from being able to start against a load, have actually to be pulled round by hand before they will start at all.

Even in the case of lifts there is a wide sphere of utility for S.P. motors. The writer has a lift worked by an S.P. motor on the Derby mains which is perfectly satisfactory. Although the motor starts light, the lift is working at full speed within 7 seconds of the motor being switched on. A short description may be of interest.

Fig. 1 is a plan of the cage; the motor and gearing are fixed on the top of the cage and move with it. The motor, a 4 B.H.P. Langdon-Davies, is switched on inside the cage and quickly runs up to speed, simply driving its own spindle and spindle B, and also the bevel wheels C_1, C_2, C_3; the two latter are at present loose on their spindle. The starting lever inside the cage when pulled over brings a friction cone to bear on the inner surface of the shoulder on bevel wheels C_1 and C_2. This throws shafts D and E into gear and causes the lift to rise or fall at will.

The time necessary to start the lift, i. e., 7 seconds, is sufficiently short to justify the contention that the S. P. motor can be used for lift purposes in a great variety of cases.

A few notes as to what is actually being done on supply systems with S. P. motors may not be out of place,

For purposes of comparison, it is a matter of interest to note what is being done in a city where the D. C. motor business is vigorously pushed.

In Bradford the low charges and easy terms of hire have resulted in a considerable motor load being obtained. Up to the end of June 1899, there were 307 motors connected to the mains, and the proportion of units sold for power to total units sold was about 17 per cent.

It is doubtful if this result has been equalled in any other town in the country.

It will perhaps be somewhat of a surprise to some members of the Association to find that on the Continent the above results have been far eclipsed by the use of S. P. motors. In the city of Frankfort, on March 31, 1899, there were single-phase motors of an aggregate of no less than 4,532 B.H.P. connected to the mains, while the proportion of power units sold to total units sold was no less than 58 per cent., the figures being, for power 1,851,268 units, and for light 1,342,399 units, total 3,193,667 units sold. The largest motors are of 750 B.H.P. of which there are three. They are of the synchronous type and are coupled to D. C. generators, and are used for driving the trams. With the exception of these all the motors are of the induction type, the largest of which are of 90 B.H.P. The larger motors are run from separate transformers fed from the nearest feeders, while the smaller sizes are taken direct from the low tension network, while the steadiness of the light leaves nothing to be desired.

The generating sets are as follows:

Two of 1,500 I.H.P. and four of 750 I.H.P. The frequency is 45 periods, and the armature drop, 6 per cent.

The charges for power are equivalent to 2d. per unit with discounts up to 25 per cent.

The Corporation of Derby have within the last few months commenced letting out S. P. motors on hire with gratifying results. At the present time motors equivalent to about 200 B.H.P. have been connected, of various sizes up to 30 B.H.P., and the units sold for power during the year have amounted to about 12 per cent. of the total units sold. The charges vary from 3d. to 1d. per unit according to the length of time the motor is used.

A few words may now be said on the chief characteristics of the modern S.P. motor.

The only practical motors on the market are of the synchronous and the induction type. The synchronous motor requires its field to be excited by a direct current. It is not usually self-starting, and this defect precludes its adoption for any but large sizes. It has an extremely high efficiency and power factor, and it runs at a synchronous speed.

The induction motor, which is almost exclusively used, has been greatly improved in recent years. A few years ago the maximum efficiency was not expected to be more than 60 per cent. to 65 per cent. with a power factor of about the same value, while the starting current even when the motor started light was often twice or three times the full current. Thanks, however, to the good work of Tesla, Brown, Langdon-Davies, and others, very marked improvements have been affected within the last two or three years.

The following table gives a good idea of the efficiencies of modern single-phase motors, as compared with direct current and three-phase motors. All the tests are made from motors actually at work, the S.P. motors being on the Derby mains. The motors were all made by leading firms, and though the figures do not necessarily represent the highest attainable results, they are a fair sample of good modern practice:

Type of Motor.	Brakes. HP.	EFFICIENCY. Full load.	Half load.	Quarter load.	Eighth load.
		%	%	%	%
Direct current.....	4	78	68	58	..
" "	8	84	77	59	85
Single phase.......	2	78	70	62	..
" "	6	80	76	62	46
Three phase.......	10	83.5	82	72	55
Single phase.......	12	75	78	68	54
" "	25	80	83	80	68
Three phase.......	25	87	86	82	72
Direct current.....	25	91	83	75	54
" "	25	86	78	66	..

In conclusion the writer would urge that while the S.P. motor still leaves much to be desired in the matter of power factor, starting current, starting torque, and facility of running at variable speeds, yet the absence of commutators with their attendant troubles giving such simplicity in working, together with the high average efficiency, renders it eminently suitable for general distribution work.

As is shown in the table the polyphase motor outstrips both its competitors in point of efficiency. The writer would suggest that, should a transformer or other appliance be placed on the market which without moving parts would convert a single-phase into a polyphase current, in the same manner that a two-phase can be converted into a three-phase current, in this direction may lie the solution of the motor problem.

With the increase in size of our stations, the engineers of direct current works are more and more realizing the advantages of alternating currents for generation and transmission.

The improvements in modern A.C. motors have gone a long way to lessen the force of the objection to alternating currents for distribution purposes as well, and the writer's experience justifies him in the opinion that the A.C. motor (either single or polyphase) is quite capable of satisfying all ordinary demands for power from the mains of public supply undertakings.

LEGAL NOTES.

An opinion was handed down last week by Judge Shipman, in the Circuit Court of New York, in the case of the Thomson-Houston Electric Company versus the Lorain Steel Company. This bill in equity alleges infringement by the defendant of claims 1, 2, 3 and 4 of letters patent No. 428,169, dated May 20, 1890, issued to Walter H. Knight for an improved electric motor regulator. The patent has been owned by the complainant since November 7, 1891. The invention was adapted to electric railway motors working on a circuit of "constant potential," and was designed to prevent the sudden overloading of the motor. Judge Shipman, in his opinion, held as follows: "Let there be a decree, with costs, for an injunction against the infringement of claims 1, 2, 3 and 4 of the patent and for an accounting."

CANADIAN NOTES.

(From our Ottawa Correspondent.)

The Ontario Power Company will begin development work at Niagara Falls this summer, developing first 30,000 to 50,000 horse power. The company has applications for 30,000 horse power.

The Dominion Government has received an application from Hon. Fred. Peters and Mr. E. O. Fader, of Victoria, B. C., for certain shore rights in the harbor of Vancouver B. C. They propose to utilize the rise and fall of the tides there to generate electric power, which will serve Vancouver, New Westminster, etc., and at the same time provide electric power upon a cheap scale.

Mr. J. P. Graves has made an offer to purchase from the city of Grand Forks, B. C., the water works and electric light plants for the sum of $70,000 and to expend a further sum of $30,000 in improving the systems. He also seeks to acquire an exclusive street railway franchise. In return for a bonus of $30,000, Mr. Graves offers to provide waterworks, electric light and trolley systems for the city of Columbia.

At a meeting of the shareholders of the Montreal Electric Street Railway, held on the 10th inst., the agreement between the Street Railway Company and the Chambly Power Company was ratified. The agreement requires the delivery by the latter company of 5,000 horse power continuously for a period of 23 years, with the privilege of renewal for a further term of five years, at $25 per horse power per annum.

The ratepayers of Sault Ste. Marie, Ont., have adopted a by-law granting exemption from taxation and certain other concessions to the Lake Superior Power Company, in return for which the company agrees to construct additional works, at a cost of $2,000,000, such works to include an additional water power canal, a railroad, railway station, wharves and docks, and the building of a street railway.

The Canadian Electrical Association

The city council of Kingston, Ont., will invite the Electrical Association of Canada to hold its annual convention there in August next. The convention was to have been held at Ottawa, but the fire in that city prevented. The Kingston city council will vote a sum of money for entertainment of the Association. There will likely be 400 members in attendance.

PERSONAL MENTION.

Mr. L. S. Owsley was elected president of the Northwestern Electrical Railroad Company of Chicago on the 13th inst., succeeding D. H. Louderback, who resigned.

Mr. Albert N. Libbey, representing the engine department of the Edward P. Allis Company of Milwaukee, Wis., recently returned from Sidney, Australia, where he has been for two years engaged in the setting up of an electric plant of 6,000 horse power for the Government.

Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended July 14:

Antwerp, 2 cases, $324; 28 packages, $2,252; Alexandria, 14 cases, $1,200; Bari, 3 cases, $1,060; Bordeaux, 14 packages, $808; Brazil, 4 packages trolley appliances, $211; 5 cases $158; British East Indies 34 packages, $2,643; Bristol 66 electric cables, $10,007; Brussels, 7 boxes, $91; British Possessions in Africa, 15 cases, $894; Central America, 22 packages, $521; Cuba, 168 cases, $25,802; Genoa, 19 trolley poles, $1,100; Glasgow, 2 cases, $436; 10 packages, $402; 1 case motor material, $40; 15 trolley poles, $750; Hamburg, 96 packages, $6,498; Havre, 50 packages, $4,801; 18 packages automobiles, $2,550; Hull, 1 package, $38; Japan, 67 packages, $3,601; 20 reels cable, $6,398; Leith, 9 cases, $250; Liverpool, 1,202 cases, $7,394; London, 97 cases, $9,413; 72 packages, $5,855; 51 cases automobiles, $18,000; Marseilles, 51 packages, $2,000; Mexico; 17 packages, $485; 1 reel cable, $200; Milan, 2 packages, $296; Naples, 175 packages, $35,115; New Foundland, 8 packages, $143; Nova Scotia, 57 packages, $6,318; Odessa, 7 packages, $980; Peru, 3 cases, $202; Philippines, 33 cases, $1,895; Porto Rico, 79 packages, $2,686; Siam, 21 cases, $1,235; Southampton, 26 cases, $728; Stockholm, 1 case, $225; St. Petersburg, 17 cases, $661; U. S. Colombia, 6 packages, $152.

Awarded Two Good Contracts.

J. Holt Gates & Co., of the Monadnock Building, Chicago, have been awarded the contract for the new Urbana, Ill., electric light plant, and will install one 60 k.w., 250 revolutions, and one 120 k.w., 250 revolutions, direct connected Warren alternators to Ideal engines. This plant will be particularly interesting aside from its direct connected features, from the fact that each dynamo will have an output at 7,200 alternations of 220 volts on one side of the machine and 2,200 volts on the other, thus running a three-wire system without transformers for the nearby lights and a high pressure system for the lights at a long distance from the plant. A beautiful switchboard will be installed and Warren Electric Manufacturing Company's transformers used thoughout.

The city of West Hammond, Ill., have awarded the complete new electric light plant, comprising two 30 k.w. Warren alternators and one 40 light arc machine, to J. Holt Gates & Co. A new building will be erected, boilers added and the old plant will be completely overhauled.

INCORPORATIONS.

The Trinity Place Electric Company, New York City. Directors: James W. McCarthy, John F. Jacobs and A. J. Herschmann, all of New York City.

The General Construction Company, Ft. Wayne, Ind.—to construct electric lighting plants and street railways. Capital stock, $40,000. Incorporators: T. W. Perry, P. F. Meyers and G. M. Geiger, all of Ft. Wayne.

The Peekskill Lighting Company, Peekskill, N. Y.—to manufacture electricity and gas for light, heat and power purposes. Capital stock, $50,000. Directors: Benjamin B. Nostrand, Jr., Peekskill; H. Hobart Porter, Jr., and Francis Blossom, New York City.

The Kincaid Electrical Company, Colorado Springs, Col. Capital stock, $45,000. Incorporators: E. E. Bat. F. G. Armstrong and J. C. Kincaid.

The Incandescent Burner Company, New York City. Capital stock, $6,000. Directors: J. Wallis Cook, David Touzeau and John T. Booth, all of New York City.

ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U. S Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL. Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N.W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

LETTERS PATENT ISSUED JULY 10, 1900.

ELECTRIC RAILWAYS AND APPLIANCES.

653,316. Trolley. William H. Russell, Watertown, Mass. Filed Nov. 23, 1899.

653,402. Safety-Trolley. John W. Richmond, Fishkill-on-the-Hudson, N. Y. Filed March 28, 1900.

653,549. Electric Trolley. Thomas Derrick, Lansingburg, N. Y., assignor of three-fourths to Adam Derrick, George Vandercook and George A. Dicker, same place Filed Jan. 27, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

653,253-653,254. Incandescent-Lamp Burner. Otto Lehman, New York City, assignor, by mesne assignments, to the Standard Incandescent Burner Company, Portland, Me. Filed Feb. 11, 1899, Nov. 15, 1899.

653,554. Circuit-Controller for Incandescent Lamps and Magnetic Guide Therefor. Marshall W. Hanks, Pittsburg, Pa., assignor to George Westinghouse, same place. Filed April 22, 1899. Renewed May 25, 1900.

653,572. Electric-Arc Lamp. John A. Fleming, London, Eng. Filed Dec. 23, 1899.

653,577. Thermo-Electric-Light Cup. Clarence R. La Bier, Terre Haute, Ind., assignor of one-half to Charles H. Hilton, same place. Filed Feb. 5, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

653,353. Igniter for Explosive-Engines. Fred A. Law, Hartford, Conn., assignor, by mesne assignments, to the Columbia & Electric Vehicle Company, Jersey City, N. J. Filed July 26, 1898.

653,470. Self-Starter for Electric Motors. Henry H. Cutler, Chicago, Ill. Filed June 8, 1899.

653,471. Controller for Dynamo-Electric Machines. Henry H. Cutler, Chicago, Ill. Filed Aug. 24, 1899.

653,472. Controller for Dynamos or Generators. Henry H. Cutler, Milwaukee, Wis. Original application filed Aug. 24, 1899. Divided and this application filed Jan. 29, 1900.

653,531. Machine for Grinding Carbon Diaphragms. Charles T. Richmond and Mahlon M. Zellers, Cleveland, O., assignors to the National Carbon Company, Trenton, N. J. Filed July 10, 1899.

653,636. Power Transmitting Device. David Ashman, Baltimore, Md., assignor to Eagle Manufacturing Company. Filed Jan. 25, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

653,319. Supervisory and Busy-Test Appliance for Telephone-Lines. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Oct. 3, 1898.

653,422. Telephone-Test Set. Albert C. Ludington, Marquette, Mich., assignor of one half to Nathan M. Kaufman, same place. Filed Jan. 18, 1900.

SIGNALS AND SIGNALING APPARATUS.

653,469. Electric Signaling Apparatus. Henry G. Carleton, New York City, assignor to the Carleton Electric Company, same place. Filed March 16, 1900.

MISCELLANEOUS.

653,221. Electric-Traction Balloon. Marie J. A. Deydier, Nyons, France. Filed Aug. 11, 1898.

653,231. Case for Phonograph-Records. Josephine Gilgen and Gertrude Gilgen, Chicago, Ill. Filed March 17, 1900.

653,343. Electrostatic Separation. Elmer Gates, Chevy Chase, Md., assignor to Theodore J. Mayer, Washington, D. C. Filed Dec. 2, 1899.

653,344. Diamagnetic Separation. Elmer Gates, Chevy Chase, Md., assignor to Theodore J. Mayer, Washington, D. C. Filed Dec. 2, 1899.

653,383. Apparatus for Making Radiographs. Elmer Gates, Chevy Chase, Md., assignor to Theodore J. Mayer, Washington, D. C. Filed Sept. 26, 1898.

653,448. Reel or Spool for Electric Thermostatic Cables. John D. Gould, New York City. Filed July 10, 1899.

653,530. Voltaic Cell. Charles T. Richmond, Cleveland, O., assignor to the National Carbon Company, same place. Filed Oct. 9, 1897.

653,538. Electrolytic Apparatus. Nathaniel L. Turner, Salmon City, Idaho. Filed June 7, 1899.

653,585. Contact-Brush. Samuel L. Neely, Pierron, Ill., assignor of one-half to Henry F. Knebel, same place. Filed Oct. 23, 1899.

653,590. Primary Battery. Edward R. Post, Newburg, N.Y. Filed Feb. 5, 1900.

REISSUE.

11,840. Contact System for Electric Railways. William Grunow, Jr., Bridgeport, Conn., assignor, by direct and mesne assignments, to the McElroy Grunow Electric Railway System, Jersey City, N. J. Filed May 29, 1900. Original No. 631,073, dated Aug. 15, 1899.

THE TELEPHONE WORLD.

The New Telephone Company.

The National Telephone & Telegraph Company, incorporated at Trenton, N. J., last week, with an authorized capital of $50,000,000, has not yet been formally organized, but it is believed that Joseph B. McCall, who has been the secretary of the Electric Company of America, will be elected president.

Little can be found out at present in regard to the future plans of the company, and the rumor which gained circulation in financial circles as to whether it was a combination of all independent companies outside of the Bell Company cannot be confirmed. So far as can be learned, however, no plans have been made as yet by the incorporators, except that a canvass has been made of Camden, N. J., for subscribers, and nearly 1,000 have already been secured.

The agent of the new company is James E. Hayes, of Camden, who has been the lawyer who has represented all the corporations of the Widener-Elkins syndicate.

Through the researches of Mr. Hayes, it was found that as far back as 1866 there was passed a Federal law which granted to telegraph companies the right to a national charter provided the Government was permitted the use of its lines. Mr. Hayes, in speaking of the matter to a reporter, said:

"The new company has a broader charter than that of the Telephone, Telegraph & Cable Company of America. Previous to July 4, when a new law went into effect, there were two methods of forming telephone and telegraph companies in New Jersey. The first, under the telephone and telegraph act allowed them to do business only in the State of New Jersey. The second, under the general corporation law, allowed them to do business outside of the State of New Jersey, but not within the borders of the State.

"In order to meet this situation three separate corporations have had heretofore to be organized. Two of them which did business exclusively in New Jersey, were the Sea Shore and Delaware River Telephone, Telegraph and Cable Company and the New York and Philadelphia Telephone and Telegraph Company. The Telephone, Telegraph and Cable Company of America was organized under the general corporation law to do business outside of the State.

"The passage of an amended law relating to telephone and telegraph companies has been secured, which enables a company chartered under the laws of the State of New Jersey to do business anywhere in the world. We had under consideration incorporation under the laws of the State of New York, which allowed telephone and telegraph companies to go partly beyond the State's borders. The taxation on $50,000,000 was, however, so enormous that it could not be managed.

"Through an oversight in the New Jersey law it did not go into effect until the constitutional date of operation, on July 1. Immediately I proceeded to organize this corporation under the new law. The meeting to complete the organization of the company has not yet been held. The capital of the National Telephone and Telegraph Company will be all paid up. Of the total amount $100,000 has been subscribed and paid in, with which to commence business.

"As to the scope of the company, I can say that those who have organized the new company are absolutely independent from the Telephone, Telegraph and Cable Company of America. A proposition has been made to the Telephone, Telegraph and Cable Company that is now being considered by the officials of that company, which includes the absorption of the Telephone, Telegraph and Cable Company by the National Company."

Among the directors of the new company are the following: A. Lowdon Snowden, president of the Electric Co. of America; James F. Sullivan, vice-president of the Market Street National Bank of Philadelphia and of the Midvale Steel Co.; Joseph B. McCall, a well-known capitalist; Heulings Lippincott, the New Jersey director, living at Camden, and Harry J. Verner of Philadelphia.

The Long Distance Telephone Company is actively engaged putting up poles along Blue Point avenue, in Blue Point, Suffolk County, N. Y., with a view of connecting the lines with the hotels and boarding houses along that popular thoroughfare. In less than a week all the leading hotels and boarding houses will have telephonic connection with distant places, much to the gratification of the city guests.

The retirement of Captain J. C. Parsons from the Sandusky (O.) Telephone Company to go to the Klondike, created a vacancy in the office of treasurer and in the board of directors. At a meeting of the directors J. C. Hauser was elected treasurer, and C. L. Engels was appointed to the vacant place in the directory.

Judge James M. Thomas, well known as president of the Independent Telephone Association of the United States, has been appointed general manager of the United States Telephone Company, with headquarters at Cleveland, Ohio.

Good Thing for Telephone Companies.

Attorney-General Sheets of Ohio has made a ruling which in effect over-rules the Supreme Court. He holds that telephone boxes shall be appraised at $10 for purposes of taxation, although the court has sustained the contention of former Attorney-General Monnett, that they should be appraised upon the basis of their earning capacity. By the earlier ruling the boxes were valued at not far from $100 each, but Attorney-General Sheets' opinion cuts this appraisement down 90 per cent.

The Supreme Court will not be in session until September 25, by which time a reversal of the Attorney-General would be of no avail.

Two independent long distance telephone companies are fully organized in Missouri, one of which is backed by a capital of $3,000,000 and has already commenced building from St. Louis to ultimately reach Kansas City. Another company for independent long distance service, known as the Interstate Telephone Company, backed by unlimited capital, and designed to be built largely for a trunk line, whereby all the local independent telephone companies of East Kansas and Southwest Missouri will be connected with the same, and thereby give to their subscribers long distance service at a pro rata charge, much cheaper than the charges now made by the old Bell Telephone Company and its lessees. The independent telephone companies are now fully organized to meet not only the competitive fight for the control of the telephone business, which they now have by the loyal support given them by the people everywhere, but they are now entering the field to give the people lower rates for long distance service.

The city of Richmond, Va., recently won another victory in its suit against the Southern Bell Telephone Company. Some years ago the council revoked the charter of the company, and ordered it to remove its poles and wires from the streets. This the company refused to do, and Judge Goff granted an injunction restraining the city from interfering with the company. He claimed that the company was protected by Federal statutes. The Supreme Court reversed Judge Goff, and remanded the case to the lower court to ascertain if the company had any rights under the State statutes or municipal ordinances. Judge Simonton held that it had no such rights. An appeal was taken to the United States Court of Appeals, and Judge Simonton was sustained. The company will appeal again to the Supreme Court of the United States.

The Automatic Telephone Meter Company was organized a short time ago with its principal office at 525 Main street, East Orange, N. J. The objects of the corporation are to acquire by purchase or otherwise the inventions of Newman H. Holland and Donald M. Bliss on an improvement for a telephone metering device; to apply for and obtain any and all inventions used in connection with or obtained under letters patent of this country or elsewhere, and to manufacture and deal in automatic or other apparatus and appliances for measuring service of telephones. The capital stock is $125,000. The incorporators are Charles Bate, Walter Fairchild and E. J. MuNulty. The existence of the corporation shall continue for ninety-nine years.

A telephone company, which will erect a line from Cross Fork to Galeton, Potter County, Pa., there to connect with the long distance system of the New York & Pennsylvania Telephone & Telegraph Company, has been organized at Cross Fork, with the following officers: President, E. Peltz; secretary, Martin Gorman; executive committee: E. C. Armstrong, F. W. Peck, all of Cross Fork; Herman Schwarzenbach and Otto Braun, of Germania, and Philip Meine, of Galeton. The company proposes building a telephone line via Oleona, New Bergen, Germania and Germania Station to Galeton. The line will be twenty-seven miles long, exclusive of a branch extending from Germania Station to Corbett, Pa.

It is estimated that there are over 1,000 union business houses and manufacturing establishments in Buffalo, N. Y., that are using Bell telephones. During the next three weeks committees appointed by the United Trades and Labor Council of Erie County and the electricians' union, to which the Bell Company's striking linemen belong, will visit these firms and insist on their throwing out their 'phones without further delay.

On Aug. 1 the Bell Telephone Company of Canada, will begin the laying of another telephone cable between Detroit and Windsor. The new cable will have ten circuits and will be laid beside the natural gas pipe.

The Kinloch Long Distance Telephone Company of Missouri, with a capital stock of $300,000, is now licensed to do business in Illinois with a State capital of $75,000.

Much inconvenience has been experienced on Fisher's Island by the breaking of the Southern New England Telephone cable a few weeks ago. The break is supposed to have been caused by friction against the rocky bottom. Captain Scott's tug Cassie, from New London, Conn., with telephone men was engaged several days in attempts to grapple the ends of the cable and reunite them, but after many unsuccessful attempts the work has been abandoned and islanders must await the work of laying a new line, which the telephone officials have decided to do. They are now awaiting its arrival from Boston and will push the work forward rapidly.

There is no place in the United States of anything like the size of Memphis, Tenn., where telephone service is supplied at $2 per month. The rates are lower there than at Louisville, Cincinnati, St. Louis, New Orleans, Denver, etc., to say nothing of Chicago, Boston, New York and the like The telephone rates in Memphis are on a par with Atlanta, Evansville, Indianapolis, Nashville, etc., all of which places are not as large and important as Memphis.

During the next few months the telephone system in Topeka, Kan., will be improved by the addition of 6,000 feet of cable. Manager Bayless says that new 'phones are being put in at the rate of 20 a month. On July 1, 69 new toll lines in Kansas and Missouri were added to the list. Among the towns connected with the system by the new lines are Wichita, Winfield, Arkansas City, Strong City, Sterling and Newton.

The Independent Telephone Company of Battle Creek, Mich., has devised a scheme by which it will be impossible to be swallowed up by the Bell Company, as many of the independent exchanges have been throughout the State. The stockholders have all assigned their stock for a period of three years over to three of the leading stockholders, so that there will be no danger of the Bell people coming in and buying up small stockholders and getting a controlling interest.

The West Penn Long Distance Telephone Company, composed of the same men that control the Pittsburg & Allegheny Telephone Company, has been incorporated in Pennsylvania to operate long distance connections for the parent Pittsburg exchange. It expects to apply for franchises in 27 towns in Western Pennsylvania.

The Attorney-General of Ohio has under consideration the question of exacting a license fee from the Bell Telephone Company. This company, which leases telephone boxes to the Central Union Telephone Company, and takes thousands of dollars out of the State annually, has never secured a certificate from the Secretary of State under the foreign incorporation laws.

The Mayville (N. Y.) Telephone Company has connected its lines with those of Westfield, Portland, Fredonia and Silver Creek, and is now constructing a line, via Hewes and Summerdale that will connect it with the local system of Sherman in a few days.

The Greenville telephone exchange at Greenville, N. C., passed into the hands of the Carolina & Virginia Telephone Company on July 1. The new company, it is said, will put in a new switchboard and make other improvements.

The Independent Telephone Company, a rival organization of the Nebraska Telephone Company of Nebraska City, Neb., which commenced business about a year ago, has been sold to a number of local business men.

The Central Union Telephone Company of Illinois has filed a mortgage of $1,000,000 in favor of the Old Colony Trust Company of Massachusetts. The telephone company has acquired more property and has arranged for a bond issue.

The Southern Bell Telephone Company has lately completed its long distance line to Midville, Ga., which puts that place into communication with every section where the Southern Bell is operated.

A recent incorporation known as the North Salem Telephone Company will erect a line from Purdy's Station to North Salem in Westchester County, New York.

The Central New York Telephone & Telegraph Company is constructing a double metallic circuit between Rome and Camden.

The Chicago Telephone Company's personal property assessment in Chicago is $2,450,000.

GENERAL NEWS.

What is Going On in the Electrical World.

LIGHTING.

Alvin, Tex.—W. P. Pittman of Lufkin was recently here looking over the ground with a view of establishing an electric light plant.

Ashland, Ill.—The city council will soon let the contract for erecting an electric light plant.

Atlanta, Ga.—An ordinance granting to the Atlanta Railway & Power Company the right to operate an electric lighting plant in this city has been concurred in by the board of aldermen.

Augusta, Ga.—The lumber and shingle manufacturing company of the E. E. Foy Manufacturing Company is to put in an electric light plant at its establisment.

Biddeford, Me.—The York Light & Power Company will improve its plant at a cost of about $76,000. E. J. Sullivan, superintendent.

Bonham, Tex.—T. C. Bradley, mayor of this city, wants information regarding the establishment of a $15,000 electric light plant.

Brasil, Ind.—This city contemplates the erection of a municipal electric lighting plant after the present contract with the Brazil Electric Light Company expires, which will be in 18 months.

Casselton, N. D.—The electric light plant here is to be enlarged.

Charleston, W. Va.—The city council recently took the preliminary steps toward the erection of a new electric light plant to be owned and operated by the city. The matter of the cost of the plant is to be looked into and an ordinance drawn submitting to the vote of the people the question of issuing bonds to the amount of $25,000 or $30,000.

Chicago, Ill.—The Economic Light, Heat & Power Company of this city was recently incorporated for $10,000 by E. C. Wetten and D. T. Campbell.—Plans for the utilization of the Bridgeport dumping station as an electric lighting plant after the drainage board is through with it are being made by City Electrician Ellicott.

Cornucopia, Ore.—An electric light plant will be put in at the Cornucopia mines in Union County. The waters of Pine Creek will be utilized to operate the machinery. Work on the same will begin immediately.

Delray, Mich. — The citizens are about to vote on a proposition to bond the village for $50,000 to build an electric lighting plant, which will also furnish power in case of fire.

Denver, Col.—The electric light plant of Flint & Lomax was destroyed in a recent fire, entailing a loss of $75,000.

Detroit, Mich.—The executive committee of the reorganized public lighting commission will recommend extensive improvements to the city lighting plant. New machinery is to be installed.

East Orange, N. J.—The city council recently decided to have an ordinance prepared providing for placing all electric wires underground. This is a result of the controversy between the city and the People's Light and Power Company, which has no franchise here, but has strung wires to various places without permission.

Fairport, N. Y.—The board of light commissioners has let the contract for the boiler and engine for the new electric light plant, and it is expected that the contract for the generator will be awarded soon. The plant will be completed about October 1.

Fargo, N. D.—William Mainland, secretary of the Sutherland Construction Company of New York, who represents the new interests in the Fargo Gas and Electric Company is here looking after the preliminary arrangements for the improvements to be made by the company this fall.

Fredericksburg, Md.—This city will erect its own electric light plant.

Fulton, W. Va.—It is rumored that prominent northern capitalists will erect an electrical plant in Fulton to supply the merchants and business houses with fans, motors, etc.

Galena, Ill.—The city council recently decided to advertise for bids for the erection of a municipal electric light plant.

Granite, Ore.—This place will soon have electric lights.

Grosse Point, Mich.—The lighting plant of this village is entirely inadequate for the purpose, and a petition is being circulated asking the council to call an election to vote on the question of voting bonds for a larger plant.

Hammonton, N. J.—The Hammonton-Coater Company has applied to the council for a franchise to erect an electric light plant.

Hedrick, Ia.—At a recent election it was voted to build a municipal electric lighting plant. W. D. Martin, clerk.

Hinckley, Ill.—F. C. Patton of Sycamore is considering the erection of an electric light plant here.

Howell, Mich. — The citizens have voted to issue $15,000 bonds to build an electric light plant.

Jacksonville, Fla.—The capacity of the city electric plant for incandescent illumination has been reached, and, according to Superintendent R. N. Ellis of that department, there is urgent need for an increase in the producing capacity of the plant. It is essential that the extension shall be made at once, to meet the constant demand from commercial custom and to prepare for the necessities of next winter.

Jamestown, N. Y.—The board of aldermen recently voted to expend between $8,000 and $9,000 in improving this city's electric light plant.

Mountain Lake Park, Md.—The board of directors of the Mountain Lake Park Association, met recently and awarded the contract for the electric light and water to the Mountain Lake Park Electric Light & Water Company for two years.

New Orleans, La.—A bill has lately been enacted into a law by the general assembly, authorizing the draining commission of this city to employ the electric light and power plant of the commission in the production of light for the public illumination of the city.

Norfolk, N. Y.—C. A. King contemplates the erection of a dam at Spotswood and will build an electric light plant.

Norfolk, Va.—The Norfolk, Heat, Light & Power Company, controlled by Philadelphia capitalists, has decided to issue $500,000 in bonds. Electricity will be furnished in competition with the Norfolk Railway & Light Company, controlled by the Lancaster-Williams syndicate, which has heretofore monopolized this field.

North Amherst, O.—The city council wants some electrical manufacturing concern to furnish an estimate for an electric light plant. Address City Clerk, North Amherst, O.

Petersburg, Va.—The Southside Railway & Development Company will make improvements amounting to $25,000 at its electric light works.

Redkey, Ind.—The town trustees are securing plans, etc., for erecting an electric light plant.

Rochelle, Ill.—This city will purchase a new dynamo for its electric light plant which was lately damaged by lightning.

Saint Anne, Ill. — The electric light plant at this place was recently destroyed by fire. The loss is estimated at $35,000.

Syracuse, N. Y.—New machinery costing $500,000, lately added to the plant of the Electric Light & Power Company of this city, was tested last week and found to work perfectly.

Tamaqua, Pa.—The taxpayers of this place will vote at a special election upon the proposition to increase the borough indebtedness to the sum of $25,000 for the erection of a municipal electric light plant.

Tiffin, O.—Bids are asked until July 30 for furnishing and maintaining 160 2,000 c.p. and 250 1,200 c.p. arc lights. Address J. B. Ehrenfried, clerk.

York, Pa.—Several local and out-of-town capitalists will in the near future organize a new electric light company in this city. The new plant will be located in the eastern section of the city, along the line of the Pennsylvania Railroad. They propose capitalizing the company at $100,000.

STREET RAILWAYS

Albany, N. Y.—The State Board of Railroad Commissioners recently arranged for a hearing on August 1 at the Fifth Avenue Hotel, on the application of the New York & Brooklyn Union Transportation Company and the New York, Brooklyn & Jersey City Rapid Transit Company.

Brooklyn, N. Y.—The Brooklyn Rapid Transit Company has completed the third-rail system on the Kings County Elevated Railroad and electricity will be used in oporating the trains in a few days.

Conneaut, O.—The Pennsylvania & Ohio Electric Railway will extend its line from Conneaut to Erie before the extension is made to Ashtabula.

Elizabeth, N. J.—The board of freeholders recently awarded to John Kean a franchise for a trolley railroad extension from this city to Cranford for $73,000.

Elkton, Md.—The Cherry Hill, Elkton & Chesapeake City trolley road is now an assured fact, the entire capital stock of the company having been subscribed by Deegan & Co. of Philadelphia.

Evansville, Ind.—W. S. Henning of Dayton, O., who is building an electric line from this city to Boonville, has announced he will build a line from Evansville to New Harmony by way of Mt. Vernon.

Flint, Mich.—Judge Taylor of this city announces that the electric line from Saginaw via Flint to Pontiac will be under construction within 30 days. The line will cost $1,000,000.

Hellertown, Pa.—A trolley road is to be built from here to Doylestown, Bucks County.

Jeffersonville, Ky.—Capt. Ed. Howard, who owns Arctic Springs, is planning to spend about $12,000 in making a park at that place. He will run an electric line from this city to the park and has secured the right of way over the land lying immediately north of Utica pike.

Lenox, Mass.—The survey for the trolley route from Pittsfield to this city was recently completed.

New Haven, Conn.—The Moodus & East Hampton Electric Railway Company and the Mutual Construction Company was incorporated last week. The line will be extended along the bank of the Connecticut River.

Rochester, N. Y.—Calvin Hotchkiss and James D. Bashford, who own a franchise for electric light, heat and power, will soon begin a trolley line to connect this city with Sodus Bay.

Shelbyville, Ill.—The Harvey City & Southern Electric Railroad Company was recently incorporated for the purpose of constructing a road from Harvey City to this place. The concern is capitalized at $150,000. Among those interested are J. Smith Butrum, of Decatur; R. B. Hennigh of Prairie Home, and R. H. Woodword, of Macon.

St. Louis, Mo.—A bill was recently introduced in the city council authorizing the St. Louis & Illinois Electric Railway Company to build lines on several streets in this city. T. Meyer and A. H. Smith are interested.

Warren, O.—A. A. Anderson, manager of the Mahoning Valley electric lines, lately applied to the commissioners here for a franchise for a line from this city to Andersonville. The new line will be 6 miles long.

Woodbury, Pa.—After considerable agitation and some opposition, the proposed trolley road to National Park is now positively assured.

MANUFACTURING.

Ansonia, Conn.—The National Electrical Manufacturing Company has secured a contract for placing a complete electrical fire alarm system in West Haven, including a tower station and 20 boxes, and with electro-mechanical gongs in the fire house for the use of officers of the department. The contract was secured in competition with three other manufacturers, and the National people are pleased at their success.

Chicago, Ill.—The General Electrical Repair Company was recently organized here for the purpose of manufacturing and repairing electrical apparatus. Among those interested are M. Dahl, R. W. Poelma, F. H. Wheeler, all of Chicago.

Taunton, Mass.—The Taunton Locomotive Manufacturing Company recently completed the building of an electric locomotive for the Whitin Machine Company of Whitinsville, Mass., which will be used in moving freight cars on the switch and in the yard of the company.

Zanesville, O.—The Ben Franklin Electrical Company was organized here last week. The purpose of the concern is the manufacture of a combined burglar alarm and home call clock, the patent for which has been secured by Messrs. Fergus and Reed. Among others interested are Joseph Shaw, W. W. Harper, S. A. Weller and Willis Bailey.

COMPANY MATTERS.

Chicago, Ill.—Negotiations are said to be under way in this city for a combination of the Calumet Electric Street Railway, the South Chicago Street Railway, and the Chicago Electric Traction Company.

Plymouth, W. Va.—The Carver Coal Company will build an electric plant for hauling coal.

POWER AND TRANSMISSION PLANTS.

Concord, N. H.—By a recent deal which means much for the future development of the plant of the Concord Land & Water Power Company at Sewall's Falls, the company is to furnish all the electrical energy used by the Boston & Maine Road in the shops at the south end, and to light the corporation's property in this city for a term of five years.

Salem, Ore.—A scheme to utilize the water power at Silver Creek Falls, 25 miles east of here, is being contemplated. There are three waterfalls within a short distance, the highest being 186 feet, and the other two about 150 feet each. The plan is to bring the water from two falls together, and establish there a power plant that will generate enough electricity to supply Silverton, Woodburn and other nearby towns.

Santa Cruz, Cal.—The Big Creek Power Company will shortly make application for a franchise to furnish electrical power to San Jose.

Schoharie, N. Y.—Work on the big enterprise of the Empire State Power Company at Schoharie Falls is now progressing rapidly, and the indications are that the plant will be in readiness to begin operations by August 1st.

AUTOMOBILES.

Plainfield, N. J.—The Plainfield Automobile Company, capitalized at $100,000, was organized last week. The promoters of the scheme plan to provide a public transit service in sections of the city not accommodated by trolley car lines. The incorporators of the concern are Mayor George Rockfellow, of Plainfield; Mayor N. B. Smalley, of North Plainfield; S. D. Drake, E. M. French, D. M. Smalley, and Craig A. Marsh. The automobiles will carry ten persons each, and the fare will be 10 cents.

Philadelphia, Pa.—The patents of the General Electric Auto Company of this city, sold at auction lately, were bought by James W. Cunningham for $29,000.

Salt Lake City, Utah.—Representatives of the new Electric Vehicle Company placed the first carriage on the streets of this city about ten days ago.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16¾c.; Lake, 16½@16¾c.; casting, 16@16½c.

The Trenton, N. J., Street Railway Company has advanced all wages 15 cents a day.

The United Traction Company, of Albany, has declared the usual 1½ per cent. quarterly dividend.

The pool which has recently been working in Brooklyn Rapid Transit is said to consis principally of A. N. Brady, Thomas F. Ryan, W. C. Whitney and their associates.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 16½@17½; New York Electric Vehicle Transportation, 6⅞@7; New England Transportation, 3¼@4¼; Gramophone, 30@40.

At the regular meeting of the New England Street Railway Company it was decided to pass the regular quarterly dividend of 1½ per cent. and devote the dividend, amounting to about $5,500, to the debt of the company.

The Siemens & Halske Electric Company has sold to Robert McAllister Lloyd and Walter H. Johnson of New York City six blocks at the northwest corner of West Sixteenth street and Robinson avenue, in the township of Cicero, near Chicago.

The Worcester (Mass.) Electric Light Company is to begin to declare dividends at the rate of 10 per cent. per annum. The first quarterly dividend of 2½ per cent. will be paid October 1 on the $400,000 of stock, including the new issue of $100,000.

Telephone stocks are selling in Boston on nearly an equal income basis, American Telephone and Telegraph Company at 145 nets the investor 5 17 per cent.; Erie Telephone Company at 88 nets 5 10 per cent, and New England Telephone at 120 nets 5 per cent.

The stockholders of the electric railway to be built along the Ridge road between Buffalo and Rochester, N. Y., will soon meet and consider the advisability of increasing the capital stock from $1,250,000 to $2,500,000. The survey of the road has been completed.

The Knickerbocker Trust Company of New York has brought suit in the United States Court asking for the foreclosure of a mortgage against the Lakeside Street Railroad Company, of Ft. Wayne, Ind., and for the appointment of a receiver and the sale of the company's property.

The minority stockholders of the Southern Electric Railroad of St. Louis, have brought suit, through the State Attorney General, to annul the purchase of the road by the St. Louis Transit Company. The case is a test one and, if won, may break up the St. Louis Transit "deal."

Two heavy mortgages were filed last week in the office of the clerk of the superior court in Atlanta, Ga., to secure bond issues amounting in the aggregate to $3,000,000. One mortgage was made by the Atlanta Rapid Transit Company to secure bonds amounting to $1,000,000. The other was by the Georgia Electric Light Company to secure $2,000,000 of bonds.

W. E. Barrows, president of the Welsbach Light Company, which has been merged into the Welsbach Company, reports for the fiscal year ending April 30 net earnings amounting to $416,910. The dividends paid amounted to $206,406 and there was charged to depreciation and patent litigation $87,763, leaving a surplus of $210,504. Directors were elected last week but action upon dissolution of the company was deferred for the present. The company's net earnings in 1899 were $410,417; in 1898 they were $475,267 and in 1897 $463,677.

The annual report of the directors of the Canadian Electric Company at the meeting of the shareholders held in the city of Quebec, showed that the development works of the company were well advanced and would probably be completed by the end of next September Contracts have already been made for 3,000 lights, and it is expected that operations will be commenced with a lighting load of about 6,000 lights. Negotiations were in progress for lighting the streets of Levis, Que., and applications have been received from several manufacturing concerns for power.

A plan for combining the Calumet Electric Street Railway of Chicago, the South Chicago Street Railway and the Chicago Electric Traction Company has been revived. It is presumed that the application recently made for the appointment of a receiver for the Chicago Electric Traction Company is preliminary to the consolidation. Persons who are interested in the plan decline to say anything about it, but that negotiations are under way for the combination of the three properties is admitted. The combined roads operate nearly 150 miles and represent an investment of $7,000,000 to $8,000,000. Boston and New York parties are supposed to be interested in the deal.

The annual meeting of the Chicago Union Traction Company will be held in Chicago next Tuesday. The directors, as the board is now made up, are Chicago men, the Eastern interests having arranged for such representation to give the road greater strength in its own locality. Inside interests state that the cutting down of the North Chicago earnings, through the competition of the Northwestern Elevated Company (C. T. Yerkes' line), will be overcome as soon as the novelty of the elevated road wears off. In the month of June the North Chicago earnings compared with a year ago, decreased $39,714, while the West Chicago increased $8,377, a net decrease of $31,337.

Judge Shipman of the United States Court, New York, has rendered a far-reaching decision in the suit of John A. Brill, president of the J. G. Brill Co., of Philadelphia vs. the Third Avenue Railroad Company. The Third Avenue Company purchased in 1894 and 1895 from the Bemis Company of Springfield, Mass., 180 car trucks in which were employed elleptical springs. Mr. Brill was granted a patent for this type of truck in 1892. The court held that these trucks were an infringement of the Brill patent and ordered a decree with costs, ordered an accounting for damages and profits and issued an injunction restraining further infringement. Nearly all of the single trucks made in the country since the early 90s have this construction, hence the far-reaching effect of the decision.

President Rossiter's statement relative to the earnings of the Brooklyn Rapid Transit Company for the fiscal year ending June 30 is encouraging. He said: "The earnings of the Brooklyn Rapid Transit Company for the past year are satisfactory—the largest made in the history of the road. The annual report, which is now in course of preparation, will be filed ahead of the time prescribed for such action. The exact figures will not be made public until the report is completed, and I will make no estimates." Mr. Rossiter also said that this week he expected "to abolish steam power upon the Kings County Elevated Railroad as far as East New York, and upon the Lexington Avenue line, and to run the cars by electric motors." He added that he expected "from the present outlook to run the Kings County cars over the Brooklyn Bridge in a month or six weeks. With the new arrangement in force, two thirds of the Brooklyn Elevated system would use electricity as a motive power. The lines unequipped are the Myrtle Avenue and the Broadway. The company is laying the third rail upon these lines, so that it is a question of only a few months before the whole Brooklyn elevated system will be operated by electricity."

EDITORIAL NOTES.

General Electric Company Increases Its Capital Stock.

A special meeting of the stockholders of the General Electric Company took place at Schenectady, N. Y., on July 17. The object of the meeting was to vote on a proposition to increase the capital stock by $4,415,000 to retire outstanding debenture bonds. There were present 153,000 out of a total of 208,272 shares. The issue of 44,150 additional common shares was duly authorized, which brings the total capitalization of the company to $25,242,200, consisting of 25,512 shares of preferred stock of the par value of $100 each, and 226,910 shares of common stock of the par value of $100 each. As previously stated the new stock will be used for the purpose of retiring the outstanding 5 per cent. gold coupon debenture bonds of the issue of June, 1892. About 50 per cent. of these bonds have from time to time been cancelled, leaving $5,298,000 yet to be taken. It is rumored that the company will offer the new stock to present shareholders at par. It is figured that the rights would give the shareholders about 20 to 25 per cent. on the new stock at par, equivalent at present prices to a dividend of about 7 per cent. It is further suggested that this would be nothing more than right to the stockholders, inasmuch as out of earnings aggregating some 25 per cent. in 1899, stockholders received only 6 per cent., and the business so far for 1900 is claimed to be fully holding its own.

* * *

New Types of Electric Elevators.

Electric elevators for both office buildings and private residences are coming more and more into use, and are fast crowding out the hydraulic type that was so popular a few years ago.

In high office buildings and in hotels the elevator is just as necessary as the plumbing system, but up to now means for conveying persons from one story to another has not been extensively adopted in private residences—excepting those belonging to the very wealthy—owing principally to the expense which such a system entails. In a recent issue of the New York "Record and Guide" it is pointed out that now, however, architects and builders are making provision in their designs for new private residences for an elevator shaft, whether the first tenant desires an elevator or not. This is due to a great extent to the fact that several comparatively simple and inexpensive elevator systems have been devised of late which may be installed in a private residence for a few thousand dollars, and which do not require the constant service of an attendant. The paper already referred to says:

"A recent improvement which particularly adapts the electric elevator to residences is a system of push-buttons by which the elevator can be operated with the utmost precision and safety, and which makes an attendant unnecessary. A push-button is placed in every hallway landing, and inside the car a button numbered to correspond with each floor and also a safety button are placed. By pressing any one of the hallway buttons the elevator will ascend or descend to that floor, stopping automatically at the landing. By pressing the button inside the car, which corresponds with the floor it is desired to stop at, the elevator will proceed to that floor, stopping of itself at the landing. By pressing the safety button inside the car, the elevator can be brought to a stop immediately. To give the operator in the car full control, the hallway buttons are made inoperative while the car is in motion. For greater safety, the modern devices that prevent any door being opened until the car has come to a stop opposite that door, and that prevent the car being moved until every door in the shaft has been securely closed, are important features. The ordinary location of the elevator shaft in American basement residences is just back of the upper landings of the stairs, a place commonly occupied by closets or ventilating shafts in the old high-stoop-houses."

The cost of running such an elevator depends of course upon the loads carried, but is said to average about ¼ cent. a trip, the current for its operation being taken directly from the street main, as in the case of lighting. Once in working order, there is no other expense than this, an occasional oiling of the machine being the only attention necessary. Thus it will be seen that an elevator system of this type is easily within the reach of persons of moderate means.

Another type of electric elevator, recently patented by two residents of Wellston, O., has for its object the simplification of the construction and relative arrangement of the motor and co-operating parts which lift the

Digitized by Google

car. In this system all the operating appliances are placed on the car, there being no drum or cable arrangement by which the car is lifted.

Through the center of the elevator well a vertical screw threaded shaft is suspended, being held securely at either end to prevent rotation. At the top of the car and surrounding the shaft is an electric motor, which is directly connected to an elongated nut, the latter being threaded internally to fit the threads of the shaft. When the current is turned on by means of a controller on the car, the nut is supposed to revolve on the shaft and lift the car to the desired floor. The inventors claim that any danger of the car dropping is entirely eliminated, for when the armature of the motor is at rest it forms an efficient lock, by which the car is held in a fixed position. To prevent the car from striking against the top or bottom of the well, should the operator neglect to cut off the power, the ends of the shaft are made smooth at a certain point, thereby removing all danger of crushing the car and its occupants. What would happen were the armature to burn out or otherwise become deranged, and whether any provision has been made for such a contingency is not stated.

* * *

An Experiment Looking to the Abolishment of the Centralized Labor System. An attempt is about to be made near Budapest, Hungary, by the Ungarische Elektricitäts Allgemeine Gesellschaft and the Budapester Allgemeine Elektricitäts Gesellschaft to abolish the factory system by supplying cottages and homesteads with cheap electric power for the running of light machinery. This, it is thought, may possibly be the solution of an economic problem that has been troubling industrial economists for some time. Treating of this subject the London "Electrician" says:

"The feasibility of this as an alternative to the existing factory system has more than once been advanced by prominent economists in this country. Lord Salisbury, for example, has on several occasions expressed the opinion that the advent of electric power would revolutionize industrial methods, decentralizing industry from the factory to the home. On the other hand, it has been shown that the factor of cheap power is not the sole consideration, nor indeed the principal consideration, in determining whether an industry should be carried on in a factory or in a number of isolated homesteads. Other considerations, such as the distribution of the raw material and the collection of the finished products, enormously affect the question."

It might also be added that as a general rule more and better work can be obtained from a body of men or women working under the direct supervision of a competent superintendent than were the working force scattered in all directions and necessarily more or less dependent on their own judgment. Furthermore, at a factory there is as a rule little opportunity of having their attention taken from their work, whereas at home there would be very apt to be unavoidable interruptions.

This system has been tried, if we are not mistaken, in a certain section of France, with what result, however, we are not prepared to say. As our contemporary intimates, therefore, it will be interesting to see what degree of success is effected with the Hungarian experiment.

Electro-Culture. For several years now experiments have been carried on in various localities with a view to ascertaining exactly what effect an electric current has on plant life. At the electro-culture experimental station in Amherst, Mass., electricity has been applied to beets, radishes, flowers and fruits with very satisfactory results, which we referred to in these columns some years ago. At that time it was pointed out by the use of the electric current, beets that formerly yielded 18 to 20 per cent. of sugar were made to yield 25 to 30 per cent. That flowers subjected to the action of the electric current grew more rapidly and gave forth more fragrance than those grown in the ordinary way. This is accounted for by the fact that the electric current in passing through the soil liberates the nitrogen which is eagerly sought for by the plants, owing to its fertilizing qualities.

In view of the results obtained at Amherst, a series of experiments recently carried on in Russia will prove of interest. The latter experiments were started on three different lines, M. Spyeshneff repeating well known experiments on electrified seeds, confirmed the belief already existing that such seeds germinate more rapidly and give better crops—from two and one-half to six times higher—than seeds that have not been submitted to preliminary electrification. He next repeated the experiment of Ross—that is, burying in the soil one copper and one zinc plate between which a current of electricity was made to pass. It was found that potatoes and roots grown in the electrified space gave crops three times heavier than those which were grown close by on a test plat. The growth was especially vigorous in the carrot, many of these roots attaining a diameter of from ten to twelve inches. In his third set of experiments Spyeshneff started out on more original lines. He placed on his experimental plat, about ten yards apart, wooden posts surmounted with metallic aigrettes connected by wires, so as to cultivate his plants under a network of wires. One of the striking results obtained was that the growth and ripening of the barley crop was accelerated by twelve days.

Another Russian has just undertaken a series of laboratory experiments upon boxes of soil subjected to electric currents. Observation showed that the temperature of the soil was raised by these currents. Its moisture decreased first, but began to increase after a course of three weeks—the same increase of moisture has been noticed by other investigators. Finally the amount of vegetable matter in the soil was increased by the currents.

As stated on a former occasion when referring to this subject, the effect of electricity on plant life is extremely interesting, but it would seem very doubtful if electric currents as a stimulant will ever be made use of in a practical way by farmers. The cost alone of preparing a large farm would prohibit its use. It might, however, be adopted with advantage in hot-houses, experiments having shown that electro-culture has a beneficial effect on flowers by quickening their growth and strengthening their fragrance.

ELECTRIC headlights for railway locomotives are coming very generally into use in the Western States, and are paying for themselves in saving the railway companies large sums formerly paid for cattle killed on the track.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

DURING an electrical storm Saturday night an open car on the Madison avenue line in New York City was struck by lightning near 83d street. The car was crowded with passengers, huddled together to avoid the rain that was beating in under the blinds and shades, and a scene of wild panic followed. Considerable disturbance was also caused on the 79th street branch circuit of the New York Telephone Company, as all the telephone bells were set violently ringing at the time of the storm. The phenomenon lasted some seconds, and caused scores of anxious householders to make inquiry. Some of the 'phones were burned out.

IT is now known that the New York Central Railroad Company has in contemplation the adoption of some system of motive power other than steam, on that section of its system between the Grand Central station and Mott Haven. The idea is to do away with the running of engines through the Park avenue tunnel. It is expected that electricity will be the power selected.

IT is stated that the Edison electrical gold saving plant is in constant and successful operation on the Ortiz mine grant near Dolores, Col., giving employment to a force of twelve men. The secret of the new process whereby the gold values are rescued from the auriferous gravel and sand of the Ortiz grant without the aid of water, has not been confided to the public. It is still one of the personal private possessions of Thomas A. Edison; but it is evidently more than meeting the expectations of its inventor and his business associates, and little doubt is entertained that it is destined to revolutionize present methods of reducing gold-bearing ores.

ACCORDING to the Automobile Almanac for 1900, there are at present in use in the United States 688 automobiles, or about one-tenth the number in France. United States occupies second place on the list, Belgium being third, with 478; Germany fourth, with 434; Great Britian fifth, with 412, and Austria sixth, with 403.

THE latest published statistics show capital to the amount of $200,000,000 invested in the electrical industry in Germany, not including street car lines and generating plants.

NEXT to making water run up hill, is that of the invention of a gentleman in Montreal, Mr. A. G. Ingalls, a graduate of McGill University in that city. His invention is a process by which water may be used so as to effect an immense saving in the consumption of coal. In fact it may be said that water practically, is the fuel and coal is merely an auxiliary. The method is such that a thin spray of water is spread over a coal flame in such a way, and with such auxiliaries, that the heat of the flame is wonderfully augmented. The full details of the secret are not yet made public by the inventor. The discovery, it is alleged, can be applied to gas and other flames.

THE fire alarm system of Kearny, N. J., has been giving trouble for several months. The mechanism in the boxes failed to work properly and the alarms have sounded in such a way as

Digitized by Google

to cause confusion in the fire houses. Last week it was decided to remove the central switchboard in the Highland hose house from the basement to the top floor, under the impression that dampness caused the trouble. When the carpenters took apart a partition in the basement, in a dark corner a hiss was heard, and the next moment a snake measuring 18 inches crawled out of the opening. Two dead snakes were found later in the wheels of the striking apparatus. This explained the trouble. The switchboard and striking mechanism were near one of the cellar windows, in which was a broken pane. It is supposed that the snakes entered the cellar through the window and crawled into the apparatus by way of one of the holes through which the wires run to the switchboard. The alarm now works perfectly.

IN its five months of life, the automobile stage coach and mail line which has been established in Speyer, Germany, has carried 40,000 passengers. Each coach carries twenty-eight passengers. The route is ten miles, and the company has a contract to carry the mails.

THE Royal Society held its annual conversazione in London recently when, as usual, a large and distinguished company assembled to view an interesting collection of scientific appliances and inventions. Of these, perhaps the most remarkable was a clock controlled at a distance by the wireless telegraphy of the Hertzian wave system. The great potentialities of the invention may be understood when it is explained that under the conditions which the exhibitor, Richard Kerr, F. G. S., proposes, it would be possible for the whole of the clocks in London to be simultaneously adjusted by one clock to which the necessary contrivance had been attached. To render a clock sensitive to the influence of the wave system it would be necessary to affix a receiving instrument with a coherer, an arrangement which might be extended not only to the public clocks but to those of private residences. Then by means of a transmitter established at any point of the city it would be possible to adjust every clock in London by the instantaneous pressure of a button.

NEWS from Carthage, Mo., states that an electric ore finder has been attracting a good deal of attention lately in different portions of the country. Capt. Dahlgren of that city says he is confident that it will always indicate it whenever passing over deposits of ore. One can never tell, however, whether it is a lead, jack or mundic deposit. The instrument is so arranged as to indicate the amount of electrical resistance there is in the earth under it. In passing over a limestone bar, the resistance is always high, away up in the thousands sometimes, while it often registers below the hundred mark when placed over large deposits. It is likely that some parties near Carthage are going to try it soon.

THE oiling of machinery in large factories is a laborious and sometimes dangerous task, to say nothing of the chance of missing several oil cups, which give warning later on by sundry squeaks, when it becomes necessary to begin a hunt for the dry bearing. With an oil cup recently patented, all this trouble and damage to the machinery is eliminated. The cups are of large size and are fitted with a pair of electric magnets at one side. When the current is turned into the circuit connecting all the magnets the latter actuate the pivoted bars and pull the plungers out of the openings, allowing the oil to flow to the bearings. On account of the large size of the cups it is only necessary to fill them at long intervals, and a cup in a convenient place can be watched to ascertain the quantity of oil still remaining throughout the circuit. An arrangement can also be made whereby the machinery will automatically close the circuit at intervals, thus making it unnecessary to pay any attention to the oiling process until the cups become empty.

A NEW invention, which is now attracting the attention of some of the largest manufacturers of rubber and electrical goods, is that of "Adirondackite." This new substance is the outcome of much study and chemical experiment by the owner, C. F. Walters, a pharmacist, of Prospect, Oneida County, N. Y., who claims for this new rival of rubber cheapness, and that it is adapted for use in making waterproof articles for wearing apparel of all kinds. It can be used in the place of rubber for belting, or mixed with it, is an excellent insulator of electricity, and can be used for covering copper wires. Owing to its plastic qualities wires so covered can be bent to conform to any angle desired.

AN Associated Press dispatch says that the Strowger Automatic Telephone Exchange of Chicago has been paid $350,000 by the German Government for the patents and rights to manufacture and use the company's automatic switch. A trial of the switch was made in Berlin last January, when the first payment of $150,000 was made.

SECRETARY H. E. CHUBBUCK of the Illinois Electric Association is going to collect a large number of vital statistics from the 200 odd members of the association, which represents practically all of the electric light plants in the State. Mr. Chubbuck has prepared a blank whose queries include the name of the company, names of the officers, its capital stock, a description of the machinery, power and circuits, etc., kind and cost of fuel used, whether the company has any city contract, and if so the prices, the population of the place, and a number of other questions, the whole numbering about thirty. The answers will be used by the secretary for tabulating general facts tending to throw light on the cost and profits of production, etc.

CONSUL GENERAL LAY, of Barcelona writes to the State Department at Washington as follows concerning the Barcelona & San Andres Railway, an electrical system to be built between Barcelona and Horta, a distance of four miles: "I find it very difficult to get any reliable information about projected roads, especially about those for which the equipment is being bought, as the directors, chief engineers and other officials of the new tramways are foreigners, and have their headquarters in other cities. I would suggest, therefore, that our manufacturers write to the Société Anonyme d'Entreprise Generalé de Travaux, Liege, Belgium, in good time before the contracts are let at Brussels. The society is a very large one and has built many miles of tramways in Europe, and is constructing lines in Russia, I understand, at the present time. In connection with the sale of electrical supplies and equipment in Barcelona, I would advise manufacturers of motors not used in connection with tramways and other small electrical appliances that their agents here must keep a certain stock of such articles on hand, as I am informed by several electrical importers of Barcelona that frequently English or German goods are sold because the purchaser cannot wait for better American made articles, which take so long to come from the United States."

RIDING in motor vehicles has become such a popular fad in Westchester County, N.Y., that a number of wealthy men have decided to form an automobile club, which will be composed of motor vehicle owners in New York, Westchester and Connecticut. The name of the club will, it is stated, be decided upon at the next meeting when officers will be elected and by-laws adopted. It is claimed that the new club will not conflict with the New York Automobile Club, but will be a separate and distinct organization. One of its principal purposes will be to provide supply stations along the Albany Post Road, Boston Post Road, the new macadamized boulevards now being constructed through the Bronx and the Hudson River Valleys, and other cross-country roads leading to the Ardsley Casino, Westchester Country Club, and the Knollwood Country Club. At these stations gasoline and naphtha and other materials will be kept, and arrangements will also be made for charging electric machines.

THE Richmond (Va.) Locomotive Works, equipped with the most modern water-tube boiler and Corliss engines, is now making electricity not only for its own use, but for the motive power of its five large moving cranes and all the machines in its wheel and cylinder shop, and its three shearing machines. It is about to install another 100-kilowatt generator for additional electrical power. If, with the best appliances for generating electrical power by steam, the Locomotive Works find it to its advantage to get electricity from the James River Company, it would seem to be conclusive that electricity will supplant steam in less favorably equipped plants. It is thought by those who have studied the subject that in the development of this water power electricity will be of greatest service to all sorts of small enterprises, where a cheap and convenient power is necessary.

AN electric elevator to be operated in connection with the rapid handling of mail matter at the Union Station at Toronto, Ont., is about to be erected. Its dimensions will be 12 x 16 feet, and it will have a run of 20 feet, and be capable of lifting five tons. The elevator cage will be of steel, and the electric winding machinery will be placed upon steel beams resting upon the top of the shaft within which the elevator is to run. It will be equipped with special mechanical and electrical appliances for safety purposes. The intention is to have the elevator hoist and lower the automobiles in which the mail matter will be carried to and from the station.

Joint Meeting of the American Institute and British Institution of Electrical Engineers in Paris.

The following is announced as the title of the subject selected for discussion by the electrical engineers at the meeting in Paris on August 16: "The Relative Advantages of Alternate and Continuous Currents for a General Supply of Electricity, Especially with Regard to Interference with Other Interests."

Digitized by Google

NEW YORK STATE BUILDING.

The New York State Building at the Pan-American Exposition, to be held at Buffalo in 1901, is to be an edifice of substantial and enduring character. The architect is Mr. George Cary, of Buffalo. He has chosen for his guidance in the work a Greek temple of the Doric order, adapting his plans to the purposes for which the building is intended. The site chosen is on high ground near Elmwood avenue, overlooking the North Bay of the lake in Delaware Park and near the principal entrance to the Exposition grounds by street cars. The location is not only thus convenient to the electric cars, but one that is fortunate and beautiful as well from every standpoint, so that the building will add to the beauty of this popular pleasure ground. Immediately in front and across the park bay the Albright Art Gallery will stand as a companion piece in the park picture. The building will be used during the Exposition as New York State headquarters, and will contain certain of the State exhibits.

After the Exposition it will become the permanent home of the Buffalo Historical Society, whose large collection of pioneer and other historical relics will be placed therein. The floor area will be three times that now used by the Historical Society in the Build- of the Buffalo Public Library.

The dimensions of the building are 130 x 82 feet, the north front to be 20 feet less than the south. The height is 33 feet on the north and 40 feet on the south walls. The height of the basement is 12 feet, and the second floor walls reach to the roof, making the ceiling 18 feet high. In the basement are janitor's quarters and bicycle rooms (which may be entered at grade from Elmwood avenue), boiler and coal rooms, storage rooms, etc. A dining room containing 1,906 square feet faces the park to the south and opens on the north. On the ground floor is also one of the museum rooms, which communicates with the floor above by a grand staircase. Over 10,000 square feet of floor space is provided for museum purposes. There is also an assembly hall with seats for 300 persons, and a library 37 x 52½ feet. Offices, cloak and other rooms make the total floor area 31,803 feet. Fire proof materials will be used throughout in the construction of the building. The exterior will be stone. There will be no wood except the mahogany doors on the first and second floors and birch in the basement. All the door casings, inside column covering and cornices, are of plaster. All bases are marble and cement. The floors are marble, concrete, granite and wood blocks laid in asphalt. The stairways are of marble and iron. The view of the bay and lake and of the park, which will be seen from the broad columnated portico on the south side of the building, will be of the most beautiful character.

NEW YORK STATE BUILDING

Work Commenced on the Power Canal.

The first sod on the Hamilton and Lake Erie power canal was turned at the town of Silverdale, Ont., on the 18th. inst. Nearly 2,000 people were in attendance. The canal will start at Welland River and run six miles to Jordan village. A diversion canal will be built by which a fall of 225 feet will be secured. The canal will be completed about September 1, 1901. It is claimed that electric power can be produced at this point at a lower rate than at any other point where electricity is developed, as there are no engineering difficulties to be overcome. The installation plant will develop 25,000 horse power, which can be increased to 50,000 or 60,000 horse power as may be required. The canal will be 150 feet wide at the bottom, 12 feet deep, with a current of 3½ miles an hour. The cost of the work is estimated at about $1,000,000.

THE RAILWAY AND THE TELEPHONE.*

BY HENRY W. POPE.

I purpose, within the limits of this paper, to bring especially to your notice the possibilities and ramifications of the telephone, leaving you to theorize as to its availability or adaptability to the various purposes attending railway operations. Its substitution for the Morse system, in the intricate details of the manipulation of traffic, has not been encouraged to any considerable degree, but sufficient progress has been made since the last meeting of this association to warrant the belief that the process of evolution has commenced and that from this time forth the prejudices and uncertainties that have long obtained, in opposition to the introduction of the telephone, will gradually dispel themselves. I am quite confident that the more you investigate, provided, of course, your investigation is along the line of what is considered first-class or standard telephone service, the more you will be convinced of its availability for all the requirements of railway operations and astonished by its greater elasticity, to which I shall particularly refer further on. This latter qualification insures, as a necessary sequence, the most important desideratum—greater safety. Complex situations can be met and determined immediately, without the intervention of third parties, verbal negotiations between the various departments regarding the manipulation of traffic can be carried on with the facility and ease of ordinary conversation, though great distance intervene. To obtain these facilities and accomplish these results naturally involves expense, but the expense bears as little proportion to the results as does oil to the operation of the ponderous locomotive.

*Paper read at the June Convention of the Association of Railway Telegraph Superintendents at Detroit, Mich.

Digitized by Google

The increasing tendency to utilize every possible time and labor saving device is aptly illustrated in the extraordinary development and expansion of the telephone service now taking place. This growth is due to a number of causes—the general prosperity existing in all portions of the country, to competition and perhaps more than we have supposed to the campaign of education which every local telephone has inaugurated and carried on in the solicitation of business, the installation of private branch exchanges and the originating of new features.

We have been fifty or more years acquiring knowledge and experience in the application of the telegraph to our personal and business necessities, until we have naturally become wedded to its use. Its availability in cases of haste or great emergency is substantially bred in us and a great portion of the people continue to rely upon its service as cheaper and equally as quick and reliable as the telephone. The tallow dip, by force of habit, still remains a satisfactory illuminant in many of the best communities in Europe, and in this country it has a large constituency notwithstanding better and practically as cheap illuminants are available everywhere. It takes time to eradicate these inclinations to continue in the old way. To close observers the telephone is having various effects on social and business life that were not at first suspected or anticipated, but the continuing developments of this character are of a surprising nature. For example, few habits are more ingrained in the commercial and business man than that of meeting on 'change. The practice long antedated railroads and has been common among all civilized peoples. But now it would appear that having learned to make extensive use of the telephone while at the exchange, brokers are neglecting business on the floor, and are transacting it more and more directly from office to office by the telephone. This practice is gaining ground to such an extent that the exchanges in some lines of trade suffer quite appreciably. So much for trade in the bulk. The cotton growers are benefiting by the high prices this year to an unusual extent because of the greater telephonic facilities they are enjoying. This simply confirms the recent statement as to some transactions in the broom corn district of Illinois. Buyers from outside began to clean up the broom corn at $60 a ton, when a telephone official called up the farmers on this system and told them the market was rising rapidly. The result was that before the season ended they had sold their crop at $240 a ton. Telephones would be cheap at any price anywhere on such terms, and it is a fact that the value and benefit of the service are not yet by any means appreciated.

The telephone develops a new field and performs a new mission. It does not necessarily interfere with the telegraph, only in so far as the telegraph falls behind in the race for superiority by failing to develop the new uses to which it might be put. As the situation appeals to me, the telegraph is fast relegating itself to the simple transmission of news, and positive and negative or confirmatory information, too important to be trusted to the slow-going mail service and not sufficiently important to justify the employment of the telephone.

The railroad and the telegraph are frequently spoken of as annihilating space, but in comparison with the telephone this is more of a theory than fact. No business or personal transaction accomplished by the aid or employment of railroad or telegraphic facilities is consummated without a perceptible lapse of time, whereas in the employment of the telephone, transactions are and must be necessarily instantaneous.

A telephone communication is more or less a personal or private one and does not involve a third person, and has advantages over any method of transmission; distance, time, business considerations and personal discomforts of travel are all eliminated.

The mail is becoming less a factor in important business transactions, except in a confirmatory degree, or when great distances intervene. Being a Government function, it can hardly be expected to be progressive. Its recent advance, the inauguration of free rural delivery, has already been anticipated by the establishment on the part of some telephone companies of what is termed the group or colony system of telephony—weaving these ruralists together with a system of cheap telephony whereby neighborly gossip may be exchanged and all the world brought in touch, relegating the once a day rural free delivery to second place, and to the delivery of publications and second-class matter. Each system, however, makes business for the other and binds us all in one common brotherhood—the brotherhood of man. So long as the transportation of the mail remains a governmental function, its progress will be slow and its operations inferior, in comparison with similar operations conducted by corporations. There has never been a time, so long as I can remember, that the Government appropriated sufficient funds for the proper transaction of the business of the New York Post Office—an office that produces revenue equivalent to that of the entire system of the country, and only lately it was stated in the public press that large mercantile concerns in New York City were carting their mail to Brooklyn, to facilitate or expedite its delivery in Manhattan Borough and elsewhere. Imagine this condition of things under corporate management! When you reflect and consider the universal ramifications, the everyday transactions by telephone and telegraph and the possibilities of the apparatus employed, how absurd it appears that a letter containing fifty or one hundred words from New York to Chicago must be handled by a number of people, sorted, pigeon-holed, bagged and distributed, hauled in wagons and carried in bulk by trains, occupying over twenty-four hours in time and finally, after further delay, delivered by carrier as rapidly as a man can walk, and in such time as permitted by the other deliveries the carrier's route makes necessary.

The telephone makes the whole world akin. Assuming that a telephone represents three persons, which I think you will consider a fair assumption, inasmuch as your neighbor is as willing to borrow its advantages as he is a newspaper, you have at your elbow an instantaneous facility for reaching in the neighborhood of a million and a half of people, and likewise they can reach you. A telephone system, therefore, to be of any great value, must be universal in its ramifications, like the post office. When you mail a letter, you give no thought as to whether there is a post office in the far-off community to which it is destined. You write your telegram with similar confidence. By reason of a uniformity in the gauge of all railroads, and a combination of interests, you make long journeys in Pullman cars, without the necessity of burdening your mind with changes. If your post office, telegraph and Pullman facilities were restricted to local limitations, their utility and convenience would be seriously impaired.

If, therefore, these great systems with vast ramifications are essential to the welfare of the people, the telephone has a claim for universality that seems to equal if not exceed them all.

In telephoning you must reach the individual, and that this may be accomplished with the same freedom from local restrictions or boundaries as the post office, it is apparent that the system must be uniform or, like the railroad, standard gauge. If the party sought for at Chicago is a subscriber to a competing system, local to that city, he is as much without the pale of interstate or interurban intercourse as though he were beyond the sea-coast line.

While, as we all know, the telephone is daily made use of in the consummation of enormous and peculiar transactions, and many interesting feats accomplished, I will, with your indulgence, refer to a transaction as illustrative of the possibilities of the telephone, that occurred a few years since, and about which considerable was said and written at the time,

The electric light plant at Newark, N. J., in 1897, was one of the largest, at that time, in operation. Its circuits extended to all surrounding cities and towns and its 2,000 or more arc and 14,000 incandescent lights provided illumination for a vast aggregation of people. Fire was discovered in the central station at 5 o'clock on the afternoon of Tuesday, December 29, and in an hour both buildings, containing a mass of machinery and dynamos, were completely destroyed and this great lighting service suspended apparently for an indefinite period. The resources necessary to immediately rehabilitate this plant were at command, but how few of us would have had the foresightedness to bring into play the advantages and ramifications of a great telephone system in the manner availed of by President Jackson of the Newark Company. Sitting down before the telephone while the buildings were still in flames and everything sure of final destruction, he rang up the central office, and was put in immediate communication with the General Electric Company's shops, Cleveland, Ohio—585 miles away. The shops were closed and the men gone for the night and only the watchman around. A call was then made for the Cleveland residence of the general manager, Mr. Hamill. Mr. Hamill was found to be in Boston. Immediately the assistant general manager was called at his residence in East Cleveland. He replied that he would telephone to Mr. Hamill at his hotel in Boston, 681 miles away, for instructions. The connection was obtained, and Mr. Hamill, in reply, gave instructions to blow the whistle, get out the men, secure cars from the railroad and have them switched into the shops and to load every available piece of electrical apparatus, and also to make arrangements, by telephone, with the Pennsylvania Railroad for a special train to run through direct from Cleveland to Newark. By midnight, before the fire had ceased in its progress of destruction, one-half the number of dynamos, weighing from 8,000 to 10,000 pounds each, were loaded on flat cars, and at three o'clock Wednesday afternoon, twenty-two hours after the breaking out of the fire, 158,000 pounds of apparatus loaded in seven cars, started for Newark. As soon as this out-

Digitized by Google

fit was arranged for, a call was similarly put in for the Stanley Company, Pittsfield, Mass., and four more cars started in a jiffy, the same day by the way. The special from Cleveland pulled in under the unloading crane in the Newark station, Thursday noon at 12:05, 19 hours and 55 minutes from Cleveland. The fast express time is about 19 hours and the average freight time is four or five days. Right behind the Cleveland train came the cars from Pittsfield.

Other arrangements and other extraordinary demands were made and filled in a similar manner. Suffice it to say that 48 hours after the fire began, two Cleveland machines were sending out the current to illuminate the broad and beautiful streets of Newark. On Friday, four more were coupled up, followed by the Stanley apparatus from Pittsfield, which in the meantime had been put in place, so that on Saturday and Sunday nights the entire original output with its attendant machinery, belts, etc., were provided for and in operation.

It was the universality of the system that led to the accomplishment of these results. No question arose in President Jackson's mind as to the telephone system employed by these great manufacturing institutions. His mind was as broad as his comprehension, and it is perfectly safe to assume that if he were asked the value of a local telephone system he would maintain that the universality of the telephone was just as essential to every day necessities of the nineteenth century as the post office or any system I have previously alluded to.

A telephone, to be of value, must talk anywhere and everywhere. Others may prefer to transact important business with you by long distance telephone, even though you are too narrow minded to appreciate the advantages that a universal system offers, in comparison with a purely local one. The system is and must necessarily be a monopoly—a natural monopoly. All this is preliminary to the question of the policy of the railroads in the treatment of the telephone question.

Railroads go into extravagance in the luxuriousness of their appointments and accommodations for people in transit in the fitting and equipping of ticket offices located in the most expensive and extravagant quarters. Ample ingress and egress is provided by at least one large door, and oftentimes by several. These doors will accommodate a considerable number of people, in any event, in excess of absolute requirements. The telephone necessities are held to be of secondary consideration and the request for more than one would heap live coals on the head of the official suggesting such a radical measure. Yet in my city there are 6,000 telephones representing a clientage of the very best element, conservatively estimated at 18,000; to transact any business with one of these offices, these people must attempt to pass through a telephone door capable of admitting 4,500 people per annum. The facts are that one railroad attempts to force 18,000 people through this telephone door, 10,000 of whom never get through, but fall by the wayside. The struggle is not unlike that of the stage coach in Bellamy's "Looking Backward." Other railroads, more considerate of this clientage, provide private branch exchanges with ample ingress and egress, and while the calls previously referred to are lost, so far as the original destination is concerned, they naturally drift into the open door of their competitors. This lost call feature, were it possible to communicate all the facts, would prove an instructive lesson to telephone users, whatever the character of their business.

The man who travels for business or pleasure is admittedly in reasonably comfortable circumstances. His office and factory are liberally provided with telephone facilities. He realizes their importance through his everyday relations and associations with his patrons and he does not see his way clear to sacrifice his business interests for a consideration of $50 or $100 per annum, and at the same time employ an office boy who is never around when wanted, an $260.00 per annum. His residence is similarly provided, because he has learned it is necessary to his own convenience and comfort. To his mind, however, the telephone charges are exorbitant; that goes without saying.

Is it reasonable to suppose, in view of this situation, that a person with these conveniences for which he pays his hard-earned money is going to rest content with the continual "busy" report from your railroad exchange circuit? Is it reasonable to assume that this large clientage of well-to-do people is going to seek your office in inclement weather, at inconvenient times, hunting information, purchasing tickets, arranging for berths, looking up freight shipments and the thousand and one other matters of everyday occurrence?

As a general proposition, you utterly ignore the fact that the telephone represents a vast aggregation of the best paying community, or that eventually, if it is not the case very largely already, more people will transact business by telephone than through the doors of your office. This class of people is the last in the world to come down to the level of your parsimony. Better devote less effort to the establishment and elaboration of ticket offices and more to the telephone door. Seek to cultivate the acquaintance of the vast number of telephone users; be prompt in response to their calls, and as courteous and obliging by telephone as you would under any other circumstances. Consider carefully that the telephone is quietly working a revolution in business methods, that the same necessity for exchanges and public offices wherein men may congregate, bargain and trade does not exist as formerly. As the working day decreases in hours, the holidays in number and the half holidays in observance, so correspondingly, and for a similar reason will transactions by telephone increase and multiply, and this augmentation of telephone usage follows similarly the introduction of new relay switchboards, private branch exchanges and hotel telephone systems. These sub-exchange systems reach every official and scores of departmental clerks of extensive railway and industrial corporations, and every occupant of a room in a hotel is put in touch with all parts of the country. The group or colony system previously referred to will bring into the fold the largest interest of all, agriculture, and by the utilization of this system the farmer will negotiate the sale of his products and their shipments. It is this feature that will necessitate a telephone in every country railway station, and if you care to cultivate this trade, it behooves you to consider the growth of this system which is soon to reach enormous proportions.

It is frequently asserted and generally believed that the telephone is ill-adapted as a substitute for Morse in the manipulation of railway traffic. As an old telegrapher I had strongly held to this opinion, but with the knowledge of what has been done and a more thorough consideration of the subject, I am a firm believer in the superiority of the telephone. Railway people are too apt to judge the possibilities of the telephone by the crude systems they install and operate, rather than by the standard of the system familiar to the telephone expert. As one of the superintendents frankly stated in his remarks before this association at a previous meeting, referring to certain experiments with regard to simultaneous telegraphy and telephony which he had been making in a desire to furnish satisfactory telephone service to his company, "I don't suppose inductive noises to them (railway employes) was any objection. I know our people would not for a moment tolerate any such noise as that on a telephone circuit, because they were accustomed to the long distance service and you know what that is."

Assuming that a railroad is equipped with a standard system, it is pretty safe to say that there is no part of the service but what can be handled more economically, more rapidly and with greater safety by telephone. A large percentage, if not the entire transmission of service, would be performed by the practical railway operatives, men more familiar and more experienced in the operation of a railway than telegraph operators, many of whom are mere boys, preferably employed because of the small compensation the position justifies. In the use of the telephone, every operative becomes to all intents and purposes a qualified operator, the switchman equally with the track foreman.

If you install a system in the manner that obtains on the New York, New Haven & Hartford road, your regard and opinion for the Morse system will dispel itself like the morning dew. The rapid introduction by railway companies of private branch exchanges is bringing you nearer and nearer to the very scheme of railway operation just alluded to. As these exchanges are established at one point and another, the demand becomes more forcible to hitch them up tandem from one end of the line to the other and the first thing you realize you are operating your system by telephone and it becomes an indispensable feature. At the same time you are woven into the great intercommunicating system and are like the states of the Union, "One and inseparable." The obstacle to the installation and expansion of this service is primarily its cost, but in considering this cost you should concede there is a factor of expense in the maintenance of wires and stations, established by long experience, below which telephone organizations in the business to stay cannot go. A railway company knows to a mill what it costs to haul a ton of freight a mile, and below that figure the management draws the line. It costs more to ride than to walk, more to telephone than to telegraph, more to telegraph than to write, but weigh the difference. If your general manager sitting in his sanctum sanctorum had the peculiar and exclusive ability of making every official or employe subject to his control, hear his voice and command without the interposition of third parties and without the detail of correspondence and red tape, what would his services command in the railway market? The private branch exchange and its connecting links provide him with this qualification and is it not reasonable to assert that the employment of these acquired talents moves the wheels of commerce with infinitely greater

Digitized by Google

rapidity, less friction and with wonderful economy of time? There is no red tape involved in telephone transmission; greater privacy and secrecy is assured, but above all, elasticity of operation is the predominating advantage in the railway service.

Ian Maclaren, in expressing himself regarding America, exploits a line of reasoning worthy of your sober consideration: "No one, unless he leaves the country, or becomes a crank, can escape from this despotism of activity; he is a part of the regiment and must march with his fellows. No man goes slow if he has the chance of going fast, no man stops to talk if he can talk walking, no man goes in a trolley car if he can get a convenient steam car, and by and by no one will go in a steam car if he can be shot through a pneumatic tube. No one writes with his own hand if he can dictate to a stenographer, no one dictates if he can telegraph, no one telegraphs if he can telephone, and by and by, when the spirit of American invention has brought wireless telegraphy into thorough condition, a man will simply sit with his mouth at one hole and his ear at another and do business with the ends of the earth in a few seconds, which the same machine will copy and preserve in letter books. It is the American's regret that at present he can do nothing with his feet while he is listening at the telephone."

DESTRUCTOR AND ELECTRIC POWER STATION AT ST. HELENS, ENGLAND.*

BY J. S. HIGHFIELD.

In view of the great interest at present taken in the combination of destructor and electric supply works, with the object of utilizing any available heat that may be obtained from the former, a short account of these works and the results attained may be of assistance to other local authorities.

The electric power station has been erected and equipped by the Electric Supply and Tramways Committee, who supply energy to work the local tramways, and also give a general supply to private consumers for light and power. The plant consists of four engines with direct coupled generators of a total capacity of 600 kw. A fifth engine is on order with a capacity of 300 kw. The engines are of Willans & Robinson's three-crank compound type, and work condensing. The condensing plant consists of a Wheeler condenser, capable of dealing with 20,000 lbs. of steam per hour; this condenser works in conjunction with a Klein cooling tower, and the plant suffices to maintain a vacuum of 25 to 26 inches. Adjacent to the electric works the health committee erected a destructor plant, the borough engineer, Mr. G. J. C. Broom, being responsible for the design of the works. The destructor works are under the supervision of the electrical engineer and his staff, who are accountable for the proper burning of the refuse. The weighing of the refuse and the removal of the clinker are in the hands of the borough engineer. The health committee pay for this supervision, and are paid in return for the number of units generated by the steam that is supplied by the destructors.

In this way the health committee are entirely responsible for the destructor works, and own the whole of the boiler plant, feed pumps, and steam pipes up to the main range in the engine house.

The destructor plant consists of two furnaces, each having two cells on the Beaman & Deas principle; the hot gases from each furnace pass through a combustion chamber, and then through a Babcock boiler having 1,740 square feet of heating surface. After leaving the boilers the gases pass through a Green's economizer having 96 tubes. A superheater is fitted to each boiler, which serves to give about 100° F. of superheat to the steam. The furnaces are fitted with closed ashpits, and forced draught is supplied under the hearths by a centrifugal blower, driven by an electric motor. This blower is designed to blow three furnaces, and hence works inefficiently when used to blow only two furnaces; at present only one furnace is used to supply steam to the electricity works. A test was carried out on one furnace by the electrical engineer, to determine the weight of refuse that could be destroyed, and other data which are given below:

TEST OF NO. 1 FURNACE AND BOILER OF BEAMAN AND DEAS CONSTRUCTOR.

Date of test, April 10, 1900.

Duration of test (10:30 A.M. to 5:50 P.M.), 7 hours 20 minutes.

State of weather, fine, windy.

Nature of fuel, unscreened ash-bin refuse of average quality.

Total weight of refuse burned, 16 tons 18 cwts. (37,912 lbs.)

Weight burnt per hour, 5,169 lbs.

Weight burnt per square foot of grate area, 103 lbs.

Total weight of clinker and ash, 5 tons 6 cwts. 1 qr. (11,900 lbs.)

Percentage of clinker and ash to refuse, 31.36 per cent.

Total water evaporated, 48,216 lbs.

Water evaporated per hour, 6,575 lbs.

Water evaporated per hour from and at 212° F., 7,955 lbs.

Water evaporated per pound of refuse 1.27 lbs.

Water evaporated per pound of refuse from and at 212° F., 1.54 lbs.

Temperature of water in tanks, 46° F.

Temperature of water from economizer, 190° F.

Average steam pressure, 132 lbs.

Average air pressure under grates, 3.1 inches of water.

Temperature in combustion chamber by copper test, 2,000° F.

Temperature in main flue before economizer, 537° F.

Temperature in main flue after economizer, 358° F.

Percentage of CO_2 (average of 21 readings), 10.4 per cent.

Percentage of O (average of 20 readings), 9.16 per cent.

Men employed on furnace, two firemen and one laborer to feed the refuse into the cells.

The very high results attained could not be kept up in practice, the labor being altogether too heavy, and the depreciation of the furnace would be very great at such a high rate of combustion as 103 lbs. per hour per square foot of grate area.

The working results from day to day are a better criterion of the utility of the destructor than the special figures attained during the short test quoted above.

The first shift of men, three in number, come in at 5 A.M., and have steam raised by 6 A.M. when the first engine is started; this engine charges a storage battery until 8 A.M. and is then shut down. At 7 A.M. a second engine is started to supply energy to the tramways; the engine is of 300 i.h.p., and is direct coupled to a shunt wound generator of 200 kw. The plant is run non-condensing except when the load is abnormally heavy, in order to take all the steam generated. As many as 20 cars can be operated continuously when the plant is working condensing. The boiler also supplies steam to a mortar mill which works 14 hours a day, and also to a winch which is used occasionally. The quality of the mortar made from the clinker is excellent. The destructor plant is worked from 2 P.M. on Monday till midnight on Saturday. No burning is done on Sunday, and on Monday the flues are thoroughly cleaned. For supplying the extra steam required when the lighting load comes on, one or more of the Lancashire boilers at the electric works is utilized according to the time of the year, and this boiler or boilers also takes the load on Sunday and Monday, to the time of starting work at the destructors. The destructor plant has now been working since January, and the results shown in the attached table are maintained steadily week by week. No coal whatever is used in the destructor furnaces. The total quantity of refuse at present available is about 200 tons per week, and a second furnace is worked one shift a day in order to burn this amount. It is probable that a third furnace will be erected, and the two boilers instead of one boiler, as at present, will be kept under steam; proportionate results will certainly be obtained.

RESULTS ATTAINED IN ORDINARY WORKING DURING MAY, 1900.

Average weight of refuse burnt per week, 143 tons 18 cwt.

Average weight of clinker and ash per week, 40 tons 8 cwt.

Average weight of mortar made per week, 15 tons 2 cwt.

Average weight of refuse per shift of 9 hours 13 tons 1¼ cwt.

Average units used to work fan, per ton, 9.

Average units generated from steam, per week, 7,062.

Average units generated per ton burnt, 50.

Average wages per ton burnt, 1s. 1¼ d.

* From the "Electrical Review," London.

THE PROTECTION OF TELEGRAPH AND TELEPHONE WIRES IN CONNECTION WITH OVERHEAD TRACTION.*

BY R. C. QUIN,
Borough Electrical and Tramway Engineer, Blackpool, Eng.

This question at the present time is of special importance in view of the number of traction systems now being installed throughout the kingdom, and in view also of the fact that there is such a divergence of opinion and practice. This latter is most marked in connection with the two Government departments concerned, the Board of Trade and the Post Office.

That overhead telegraph and telephone wires need protection will be admitted, but how shall this protection be best given? To the author the best method appears, and he thinks his readers will agree with him, to be the placing of these telegraph and telephone wires underground where they cross the line of tramway route. He believes the telephone company is not averse to this course being adopted; but we are met with the absolute refusal of the Post Office to consider any such proposition. Under these circumstances we must recognize the existence of crossing overhead wires.

* Paper read before the Municipal Electrical Association.

Digitized by Google

The most usual practice until a comparatively recent date was to place guard wires above the overhead trolley line at a distance of about 18 inches, these wires being of galvanized steel and supported by insulators. There is a question which the author has often asked, and to which he has not as yet received a satisfactory reply, and therefore he takes the liberty of placing the question before his readers. It is this—"What are the insulators intended for?" Are they to protect the telegraph or telephone wires or the trolley line?

Assuming that we adopt guard wires, they should be supported on poles two feet above the trolley line, but they should not be insulated. If a telegraph or telephone wire break what need is there to insulate from earth? If two guard wires in the same horizontal plane and 18 inches apart be placed over the trolley line, the probability is that the broken telegraph or telephone wire would not come in contact with the trolley line or passing trolley; but it might do so. In that event it is better that the guard wire should be efficiently connected to earth, as a short circuit would be the result, and if both lines, telegraph and telephone, and trolley line be properly protected by maximum current apparatus no damage would ensue. The author would, however, point out that it is not sufficient to have these guard wires clamped to a traction post, when the traction post is bedded in concrete. There should in all cases of guard wires be two poles bonded to the rails, and these poles should preferably be the end ones of the guard wire section. The telephone and telegraph wires should be provided with fusible cut-outs or other similar device for the protection of the terminal instruments, and this is a matter of no great cost. With these precautions there need be no fear of electrical accidents from overhead telegraph and telephone wires.

There is another system of protection now largely adopted and which consists of fastening to the trolley line brass clips, and placing vertically over the trolley line a wooden moulding of greater width than the trolley wire. This system, to the author, appears to have several objections. It is more unsightly than the guard wires, and brings the trolley line into greater prominence. There also appears to be difficulty in thoroughly securing these strips, for in most towns in which they are in use many lengths have become detached. Further they do not afford the same protection as guard wires. A telephone wire may break and fall on the strip, but so far no great damage results. A car however comes along, and as has happened the driver does not notice the fallen wire, but the cheeks of his trolley wheel touch the wire forming contact between it and the trolley line. We then have a live telephone wire earthed only through its terminal instruments, and a live dangling wire on the car, which is not assuring to the passengers.

There is a third method which is advocated by the Post Office, and that is a system of bunching telegraph wires so as to reduce the number of crossing places, and then forming an insulated cradle or hammock round these wires. The principal objection to this course would be extreme unsightliness. It moreover by no means follows that if a wire breaks it will not fall through the cradle, as the meshes are 2 to 3 feet square.

If we are to regard as impossible the laying underground at crossing places of telegraph and telephone wires, then the author suggests the following as the best method to protect telegraph and telephone wires:

First—The erection of two guard wires 18 inches apart, at a minimum height of 2 feet above the trolley line.

Second—The length of the guard wires to be such that should the crossing telegraph or telephone wire break close up to one span insulator, and be blown horizontally in either direction it could not when falling come in contact with an unguarded portion of the line.

Third—Each span of guard wires should be separate and distinct from its neighbor, but metallicly looped across.

Fourth—No insulators whatever should be used, but guard wire standards be bolted direct to the bracket arms, or to the span wire as the case may be.

Fifth—The terminal posts of each length of guard wire should be bonded to the tram rails.

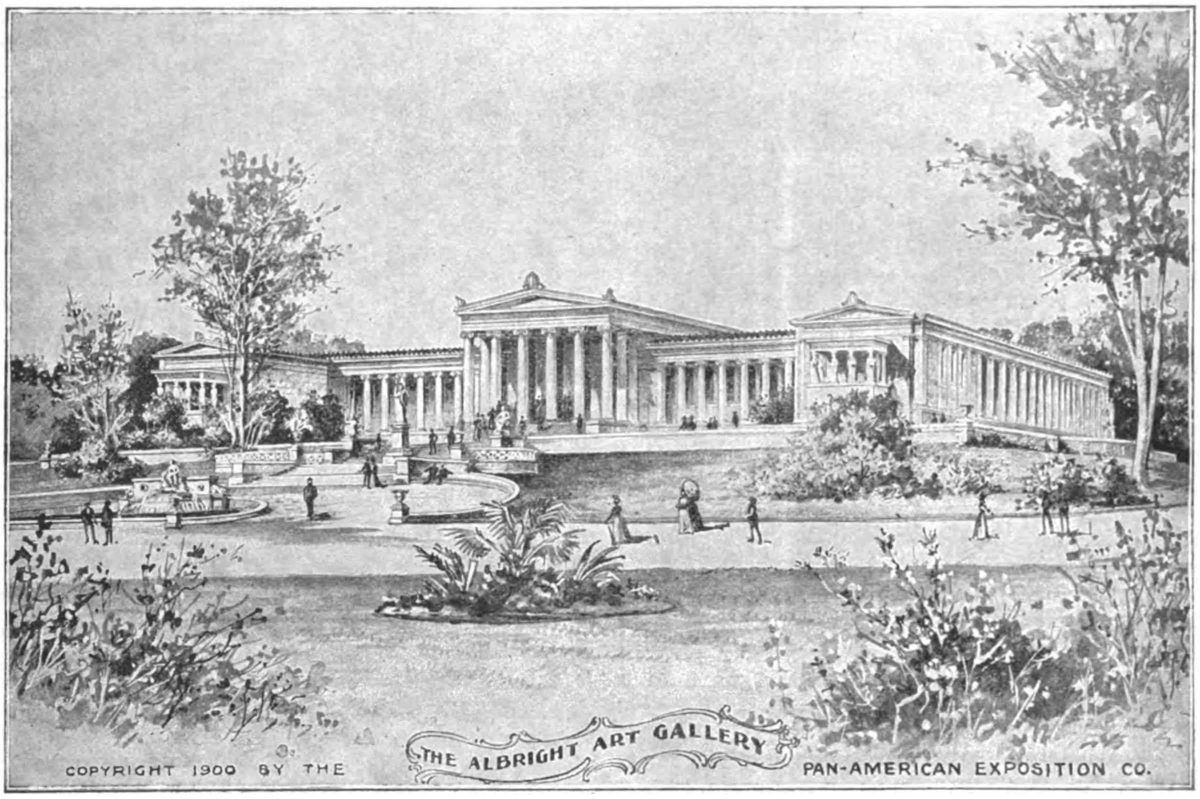
Sixth—The trolley line should be divided into sections, and each protected by a maximum current device. These sections should preferably not be of equal length, but proportioned for equal maximum working current.

Seventh—The crossing span of telegraph or telephone wires should be terminated by a disconnecting insulating shackle on each side and the connection across these shackles should be by fusible metal bridge.

If these suggestions be carried out, the author considers that all that is humanly possible to protect overhead telegraph and telephone wires will have been done.

BUFFALO'S ART PALACE.

The city of Buffalo is soon to have one of the most beautiful buildings in the western world, a public art gallery to cost upwards of $350,000.



THE ALBRIGHT ART GALLERY

The building is the gift of J. J. Albright, a citizen of Buffalo and a liberal patron of art, who desires to bestow upon his city a structure that will forever yield immeasurable pleasure to those who visit it, and become, as well, a center of culture and art. The only conditions imposed by the public spirited donor were that the city of Buffalo should furnish a site, and that the Fine Arts Academy of Buffalo, which is made the custodian of the property, should raise a maintenance fund of $100,000. The city promptly deeded the site requested, which is just within the limits of Delaware Park, overlooking the beautiful park lake. The Fine Arts Academy has complied with the terms of the gift as they applied to the maintenance fund, and the building will be hurried to completion as rapidly as conditions will permit. The building will be used as the art palace of the Pan-American Exposition and thereafter become the permanent home of Buffalo's art collections.

This magnificent edifice will be 250 feet

Digitized by Google

long by 150 feet wide, the principal facade looking toward the east. The building will stand upon a broad terrace 35 feet above the level of the park lake, which lies but a few rods below and to the eastward. The principal approach will be by a beautiful monumental flight of steps, the contour of the ground giving opportunity for stately embellishment. The terrace walls are to be of heavy granite blocks. Statuary, fountains, formal floral displays and lawns will complete the ornamentation of the terrace.

The style of architecture chosen is the classic Greek, both the eastern and western facades showing rows of rich, graceful columns. The style is Ionic. A semi-circular colonnade forms the central figure of the west or Elmwood avenue front. The building has broad wings at the extreme northern and southern ends, terminated by porches which will be reproductions of famous architectural works of ancient Greece. The highest peak is only 45 feet above ground. The Erechtheum of Athens has been a prolific source of inspiration for the architects, Messrs. Green & Wicks of Buffalo. The portico of the Erechtheum, famous for its caryatides, will be one of the works to be thus reproduced. The Erechtheum was an ancient temple and is one of the most interesting of the ruins of the Acropolis at Athens. It was rebuilt after the Persian invasion, about 400 B. C.

Entering the building by way of the main approach one comes first to the hall of statuary, in the middle of the building, which is 71 x 100 feet. Directly west of this is the hemicycle, a large semi-circular room with tiers of seats and a rostrum, where lectures may be given before audiences of several hundred people. North of statuary hall will be a gallery 35 x 58 feet. On either side of the corridor leading to this gallery are library and board rooms. Beyond, in the extreme north wing will be seven studio rooms, connected by a long corridor. In the western part of the building are two ante rooms and four large galleries. In the large light basement will be numerous other rooms for all sorts of uses in connection with the proper management of the building, such as bicycle and cloak rooms, lavatories, janitor's quarters, electric lighting and heating, packing and storage. The building will be strictly fire-proof, the materials being white marble, steel beams, brick, cement and stone. The structure will require 25,000 cubic feet of marble. All materials will be of the best, so that an enduring edifice may remain when present generations shall have vanished.

Sweden Interested in Electrical Mining Machinery.

Colorado miners are to be called upon to give instruction in mine operation to a people who have been engaged in mining for probably a thousand years. The mining machinery that has attained its present perfection while employed in Colorado mines will be installed in Swedish mines, where in some instances the methods of work now in use does not differ greatly from that of centuries ago.

K. G. Brunnberg, a mining engineer of Grangesberg, Sweden, is in Colorado studying the methods of mining and particularly making a study of electrical mining machinery.

Besides his interest in electricity as a power in mines, Mr. Brunnberg is interested in American mining machinery, and has already concluded to make a trial of it in the iron mines. He will ship machinery from this country to work with that already in use, for the sake of comparison by results, and if the American machinery proves satisfactory, Sweden will become a new market for American built machinery.

Mr. Brunnberg is connected with one of the largest mining companies in Sweden. The property is situated in the central part of the country, at Grangesberg, but they are now reaching out into a new field that he says will be larger than the old. From the mines now in operation there is taken an average of 1,000,000 tons of ore annually, one-half of which is shipped to Germany for treatment. The scarcity of fuel in Sweden is given as the reason for shipping ore abroad. The iron is taken chiefly from pit mines, some of them with openings 300 feet wide, but there are also underground workings where shafts have been sunk to a depth of 1,200 feet.

"There is but little gold mined in Sweden," said Mr. Brunnberg, "but not far from the iron mines of my company are the copper and gold mines of Farlun, that have been in operation so many years that it is not known when they were first worked. There is positive historical data to prove that they have been yielding the metals for 700 years, and they were probably in operation long before.

"We have not as satisfactory machinery in our mines as that which is in use in America. After I have made a study of the Colorado methods, I shall send home a plant of machinery similar to that I have seen here."

Protection of Buildings from Lightning.

The great obscurity which has long attended the subject of the varying effects of lightning strokes on buildings has in some measure been dissipated by recent investigations of Killingworth Hedges. Lightning conductors, as usually arranged, do not guard at all against what Dr. Oliver Lodge calls the "splitting" action of the current. They may serve to discharge or pass off on to the atmosphere the induced electricity from the earth and from the buildings upon it, but as lightning protectors they are so arranged that should they actually be struck by a flash the building would probably be set on fire. There is also an off chance that a portion of the electric current may be diverted into "unearthed" metal work and play havoc with everything in the path of its tortuous course to earth. Mr. Hedges says that in the cause of the safety of the public buildings it is necessary to explode the fallacy that a properly constructed lightning rod never fails. During a thunderstorm the atmosphere and all conducting objects in the immediate neighborhood become charged with electricity at a constantly increasing potential or intensity as the distance from the earth increases. Even objects directly on the earth, such as railroad tracks, high fences, etc., become charged and will throw out sparks of greater or less brilliancy. Mr. Hedges pronounces the steps taken for the protection from lightning of many public buildings in the past to be anything but adequate. The spire of old St. Paul's Cathedral in London was partially damaged by lightning three times, and its destruction by fire in 1561 was attributed to the same cause. In 1872 new lightning conductors took the place of those originally put up at the cathedral under the advice of the Royal Society about 144 years ago. But even the new conductors were found to be lacking in many essential points. Elements of danger due to inadequate conductors, faulty connections and other imperfections were discovered. Of this dome, statues, choir and towers none was efficiently protected. The plan recommended for St. Paul's, taking into consideration the large amount of copper already disposed about the building, is first to run three cables from the metal work of the framework supporting the cross to the roof of the dome and connecting them with the eight existing conductors, reuniting them at the base of the dome to the present system, which is increased by running a new half-inch seven-ply copper cable on the top of a parapet entirely around the building. From this horizontal conductor aigrettes, consisting of pointed copper rods, are "teed" at intervals. The whole is united by running in hard solder and the system is effectively carried to earth. It is said that the system is a model one for similar ecclesiastical structures, which do not lend themselves very readily to improved methods of lightning protection.

Visit of the American Institute of Electrical Engineers to London.

We learn from the Secretary of the British Institution of Electrical Engineers that the members of the American Institute will be offered a trip up the Thames in electric launches on Sunday, August 12, the visitors and their hosts leaving by a morning train for a starting point at a convenient part of the river, and returning the same way after lunch at a water-side hotel. On the evening of Monday, the 13th, they will be entertained by the president (Prof. Perry), and members of the Institution at a dinner in London. On Monday and Tuesday special visits will be arranged to works and places of interest in the neighborhood of London: particulars of these visits will be found awaiting American guests on their arrival in England.

Members of the American Institute who will be in London at the time of the visit are requested to place themselves in communication with the Secretary of the Institution of Electrical Engineers, 28, Victoria street, London, S. W., to which address they are also invited, if they care to do so, to have their mails forwarded.

Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended July 21:

Antwerp, 31 boxes motors, $5,317; 49 packages, $12,388; Argentine Republic, 17 cases, $1,657; Athens, 29 packages, $797; Brazil, 59 cases, $3,705; British East Indies, 45 packages, $4,349; 6 cases, $987; British Possessions in Africa, 148 packages, $10,591; British Guiana, 1 case, $30; British West Indies, 8 packages, $349; Bristol, 169 cases, $30,535; Brussels, 5 packages, $116; Central America, 69 cases, $739; China, 5 cases, $597; Copenhagen, 2 boxes, $330; Cuba, 29 packages, $1,148; Dublin, 51 packages, $3,800; Ecuador, 91 cases, $16,370; Genoa, 3 packages, $163; Glasgow, 84 packages electric motors, $7,762; 3 cases $200; 140 reels electric cable, $49,205; Hamburg, 50 packages, $6,666; 2 packages electric motors, $85; Havre, 56 cases, $11,282; Hayti, 6 packages, $107; Hull, 3 cases, 196; Japan, 139 packages, $9,567; 94 cases, $4,764; Liverpool, 142 packages, $16,707; 9 cases; 253; 43 packages motors, $2,040; 460 trolley poles, $16,587; London, 8 packages, $693; 217 cases, $12,827; 23 packages automobiles, $24,750; 21 cases motors, $1,470; Mexico, 170 packages, $19,338; Naples, 39 cases, $9,289; 93 packages motors, $2,162; Oporto, 5 packages, $199; Plymouth, 140 trolley poles,

Digitized by Google

$5,143; 110 cases, $302; Porto Rico, 95 packages, $2,660; 1 case, $23; Riga, 4 cases, $508; Sandwich Islands, 34 packages, $97; Santo Domingo, 2 cases, $23; Southampton, 219 packages, $4,872; St. Gall, 5 cases, $400; St. Petersburg, 43 cases electric motors, $6,992; 4 cases, $133; U. S. Colombia, 26 packages, $1,246.

LEGAL NOTES.

Judge Shipman, last Wednesday in the United States Circuit Court of New York handed down an opinion, in which he held that the Anchor Electric Company had infringed on a patent owned by the General Electric Company for improvements on incandescent electric lamps. An accounting of profits illegally derived from the infringement is ordered, and the defendant company is restrained from further infringement.

In a recent petition filed with the Circuit Court of Chicago James H. Raymond of the law firm of Raymond & Omohundro asks that a receiver be appointed for the International Electric Indicator Company, which has possession of one of the patents covering a divining rod. Attorney Raymond claims he is in danger of losing money that is due him from the company if it is allowed to transfer its patent to some other company. A temporary injunction of the Circuit Court was issued to restrain the transfer.

On July 18 Judge Shipman of the United States Circuit Court of New York handed down a decree in favor of the Thomson-Houston Electric Company on its claim to ownership of the Walter H. Knight patent for improvements in electric motor regulators as against the claim set up by the Lorain Steel Company. A perpetual injunction restraining the Lorain Steel Company from using the patents was granted and damages were allowed, the amount to be determined by John A. Shields as master.

Roentgen Society of the United States.

The Roentgen Society of the United States, will meet in New York City December 13 and 14, 1900, at the Academy of Medicine. Papers have been promised by eminent men abroad and here, and a very successful scientific meeting is assured. There will be offered advantages to the visiting members for instruction in X-ray work that cannot be had under any other conditions. It is especially desired that all hospitals using X-ray apparatus, X-ray studios, physicians, surgeons and dentists doing X-ray work, scientific investigators, manufacturers and dealers in X-ray apparatus of all kinds throughout the United States should at once send their names and addresses to the Chairman of Committee of Arrangements, Dr. S. H. Monell, 43 East 42d street, New York City, so that they be sent important notices regarding the meeting.

This society is the only one of its kind in America, national in character and for scientific purposes only.

All those wishing to become members or read a paper before the society may communicate with the secretary, J. Rudis Jicinsky, M. D., Cedar Rapids, Iowa.

Coal at One End, Power at the Other—the Lubricant in Between.

Plain and practical remarks upon lubrication are always of interest and value to the extensive user of machinery, and ought to be of proportionate value to all users of machinery. We quote from a paper read at a railroad club, and incidentally sprinkle in some graphite as we go along.

All men are wrong about something. A few men have found out that the coal they burn at one end of their plant, and the power they get at the other depends on the oil they use between; the rest treat oil as a trifle. A few men have also found out that the addition of 10 to 15 per cent. of Dixon's Pure Flake Graphite to the oil or grease used will enable the oil or grease to do several times more work. Other men are finding this out more slowly. A few don't care a continental.

A good lubricant is a trifle as to its cost, but it is not a trifle as to consequences. Consider what a lubricant is for—to save power in machinery. If the cost of a lubricant were one hundred times more, we would use it, but we would also study it. Even then the true question would be, not what lubricant costs least, but what lubricant saves most of power and machinery? The magnitude of lost power in machinery is variable; it is always large. It may, probably, be fairly estimated that one-half the power expended in the average case, whether in mill or shop, is wasted in lost work, being consumed in overcoming the friction of surfaces. The real value of a lubricant to the user depends upon the value of power saved by its use. To a man running a one-horse thresher it may matter but little whether the bearings of the old machine are lubricated or not, although there might be an increase in the day's output and a less tired nag if they were. To the larger user of power poor and inefficient lubrication means enormous waste of power and costs for repairs. Practical experience is far superior to theory, and while it has been most thoroughly demonstrated that an oil or grease is necessary for saving power and preventing wear, it has been just as thoroughly demonstrated that Dixon's Pure Flake Graphite is the only solid lubricant that largely enhances the lubricating value of oils and greases. Furthermore, where this graphite is used a cheaper or lower grade of oil or grease can be used and the expense of lubrication reduced as well as power saved.

JOSEPH DIXON CRUCIBLE CO.,
Jersey City, N. J.

PERSONAL MENTION.

Mr. Harry R. Bostwick, a civil engineer of San Francisco, Cal., has lately closed a contract with the Government of Corea to build an imperial highway fifteen miles long and an extension of the Corean Electric Railway on one side of it.

Mr. Alvin H. Dewey was recently appointed manager of the Bell Telephone Company in Rochester, N. Y.

INCORPORATIONS.

The Electrical Lighting Company, Caro, Mich.—to furnish light and power for Caro. W. J. Gamble is interested.

The Lincoln Gas & Electric Company, Lincoln, Neb—to operate gas and electric plants. Capital stock, $1,500,000. Incorporators: H. F. Rose, J. C. Vanpiper, S. H. Burnham and I. M. Hammond, all of Lincoln.

The American Universal Underground Electric Railway Company, Camden, N. J.—to operate trolley systems. Capital stock, $200,000. Incorporators: W. Bartram, J. M. Deal, W. C. Alexander and C. P. Ballinger.

The Irondale Water, Light & Power Company, Irondale, Ala.—to maintain and operate a system of water and gas works and an electric light and power plant. Capital stock, $100,000. Incorporators: F. W. Turpin, N. H. Sewall and Robert R. Zell.

The Citizens' Electric Light & Power Company, Kenton, O.—to produce and supply electric light. Capital stock, $20,000. Incorporators: John Glenn, W. A. Ross, Theo. Miller, Jacob Ferbing and W. L. Sinly.

ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N W, Washington, D. C., who has been identified with this work before the U. S Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W, Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

LETTERS PATENT ISSUED JULY 17, 1900.

ELECTRIC RAILWAYS AND APPLIANCES.

653,649. Underground System of Electric Railways. Charles A. Balph, Pittsburg, Pa. Filed Sept. 14, 1897.

653,885. Casing for Electric Car-Lighting Apparatus. Willard F. Richards, Buffalo, N. Y., assignor to Charles M. Gould, New York City. Filed April 4, 1900.

653,930. Fender for Tramway or Like Vehicles. Johann von Holt, Hamburg, Germany. Filed Oct. 30, 1899.

653,970. Electric-Railroad Track. Ekko Sollmann, Hoboken, N. J., assignor to the George Borgfeldt & Company, New York City. Filed April 24, 1900.

653,982. Electric Headlight. James W. G. Becker, Kansas City, Mo., assignor to the United States Headlight Company, Buffalo, N. Y. Filed April 23, 1900.

654,050. Trolley-Pole. Charles A. Brown, Lorain, O., assignor of one-half to Albert V. Hageman, same place. Filed Aug. 22, 1899.

654,105. Electric-Railway Appliance. Daniel E. Shoop, Turtle Creek, Pa., assignor of one-half to John F. Baxter, Pittsburg, Pa. Filed Dec. 9, 1899.

ELECTRIC LIGHTS AND APPLIANCES.

653,785. Electric Arc Lamp. Sigmund Bergmann, New York City, assignor to the General Incandescent Arc Light Company of New York. Filed March 18, 1899.

653,962. Incandescent-Lamp Socket. Frederic H. Manchester and Irving E. Brown, Providence, R. I. Filed May 9, 1900.

653,984. Electric-Arc Lamp. Henry G. Carleton, New York City, assignor to the Carleton Electric Company, same place. Filed Nov. 7, 1899.

ELECTRICAL MACHINERY AND APPARATUS.

653,685. Electric Cut-Out. Hiram P. Maxim, Hartford, Conn., assignor, by mesne assignments, to the Columbia & Electric Vehicle Company, Jersey City, N. J. Filed Jan. 20, 1899.

653,698. Electric Switch. James T. Robb, New York City, assignor to the Mitchell Vance Company, same place. Filed Jan. 31, 1900.

653,725. Electric Motor. Daniel C. Woodward, Hartford, Conn. Filed Sept. 6, 1898.

653,806. Electric Meter. Caryl D. Haskins, Newton, Mass., assignor to the General Electric Company of New York. Filed May 8, 1899.

653,857. Electrical Controller. Edgar H. Wise, Johnstown, Pa. Filed Jan. 19, 1900.

653,906. Alternating Current Motor. Edgar W. Brown, Dayton, O. Filed Jan. 29, 1900.

653,963. Dynamo-Electric Machine. William M. Mordey, London, Eng. Filed Oct. 25, 1898.

TELEPHONES AND TELEPHONE APPARATUS.

653,730. Telephone-Transmitter Arm. James F. Craven, Pittsburg, Pa. Filed March 22, 1900.

654,112. Telephone Call Register. William Gray, Hartford, Conn. Filed Sept. 17, 1898.

SIGNALS AND SIGNALING APPARATUS.

653,934 653,935-653,936. Page-Printing Telegraph. Donald Murray, New York City, assignor to the Postal-Telegraph Cable Company, same place. Filed Nov. 28, 1899; Feb. 7, 1900; Feb. 27, 1900.

653,941. Telegraph-Switching Apparatus. John F. Skirrow, East Orange, N. J. Filed Jan. 5, 1900.

MISCELLANEOUS.

653,667. Graphophone. Arthur C. Ferguson, New York City. Filed Oct. 9, 1899.

653,708. Hydro-Electrotherapeutic Apparatus. Johann J. Stanger, Ulm, Germany. Filed April 29, 1899.

653,713. Electric Clock. Samuel P. Thrasher, New Haven, Conn. Filed Jan. 14, 1899.

653,715. Apparatus for Electrically Treating Fabrics for Waterproofing or Other Purposes. Jean T. Van Gestel, New York City. Filed Nov. 1, 1898.

653,763-653,764-653,765. Electrogalvanic Battery. Horatio J. Brewer, New York City. Original application filed July 7, 1899. Divided and this application filed Nov. 15, 1899.

653,770. Galvanic Battery. Albrecht Heil, Frankfort-on-the Main, Germany, assignor to Columbus Electricitats-Gesellschaft mit Beschrankter Haftung, Ludwigshafen, Germany. Filed April 9, 1900.

653,784. System of Electrical Distribution. Charles De W. Anderson, Chicago, Ill. Filed April 10, 1899.

653,841. Electric Fuse. Thomas H. Brady, New Britain, Conn. Filed Jan. 2, 1900.

653,883. Secondary Battery. Arvid Reuterdahl, Providence, R. I., assignor, by direct and mesne assignments, of two-thirds to Leonard H. Campbell and George F. Weston, same place. Filed Feb. 12, 1900.

653,933. Electrode for Electrolyzing Apparatus. Rene Moritz, Lille, France. Filed Nov. 29, 1899.

653,957. Magneto-Electro Generator for Gas-Engine Igniters. Garrett W. Hendricks, Indianapolis, Ind., assignor to the Hendricks Novelty Company, same place. Filed April 30, 1900.

654,067. Electric Low-Water Alarm. Frederick Leadbeater, Detroit, Mich. Filed April 2, 1900.

654,103. Attachment for Instruments of Precision. Carl O. F. Schrottke, Berlin, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed May 15, 1899.

654,104. Measuring Instrument. Karl O. F. Schrottke, Berlin, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Sept. 2, 1899.

654,113. Battery-Electrode. Gustavos Heidel, St. Louis, Mo., assignor to the Globe Electric Company, same place. Filed Oct. 2, 1899.

Digitized by Google

THE TELEPHONE WORLD.

Plans of the National Telephone & Telegraph Company.

Commenting on the plans of the mammoth telephone company recently incorporated, the "N. Y. Commercial" says:

"Although negotiations have not yet become tangible it can be announced on unquestionable authority that a connecting current exists between the new National Telephone & Telegraph Company, and the Western Union Telegraph Company, and that if a project, which at present is only tentative, can be carried to the point of definite deal, there will be formed a powerful consolidation of telephone and telegraph interests.

It is just beginning to dawn upon the financial community that the creation of the $50,000,000 telephone company to absorb the Telephone, Telegraph & Cable Company of America, is a move of extraordinary importance. There are not lacking signs to indicate that the capital of this new concern is only the foundation for one of the largest corporations in the world.

"If present plans are not disturbed the National Telephone & Telegraph Company will shortly be formally organized, and one surprise, which the announcement of the full board of directors is likely to cause, will be the appearance in the directorate of figures now prominently identified with Western Union interests.

"The Western Union has already admitted its intention to enter the telephone field.

"It has some $14,000,000 available for the undertaking, this money to be realized from the recently authorized bond issue. And now it comes from a carefully guarded source that the Western Union will join forces with the National Telephone & Telegraph Company if terms can be agreed upon. The Western Union has an old grievance against the American Bell Company, and an alliance in that direction is dismissed as an impossibility.

"Meanwhile the Bell Company is changing its base of operations in order to be in a better position for the impending war. The Bell Company is a Massachusetts corporation and by its charter is restrained from guaranteeing dividends on the stock of foreign corporations. To circumvent this, it organized the New York Telephone Company, which is really the long distance arm of the New York Company.

"The stock of the New York Company was recently increased to $70,000,000 in order to take in the stockholders of the Bell Company, and the Bell Company is now winding up its affairs preparatory to moving into New York under the New York Telephone Company. This will probably be accomplished within 90 days.

"Some months ago the Bell Company, in negotiating for control of the Smith-Vassar system, proposed to increase the capital stock of the Smith-Vassar Telephone Company to $10,000,000 and guarantee 6 per cent. dividends thereon, but owing to its inability to do this at once, because of the Massachusetts charter, it lost the Smith-Vassar system, which is now passing into the control of the National Telephone & Telegraph Company.

"It is announced that before the close of the year the $50,000,000 capital of the National Company, will be fully employed in the business for which it was particularly organized—namely, that of electrical communication and the manufacturing incident thereto."

The Citizens' Telephone Company of Morristown, Tenn., has about completed its system, and has begun operating its exchange. The company has over one hundred 'phones in Morristown, and a fair prospect of soon reaching the 200 mark, besides having connection with all the near-by towns, and the People's Telephone Company of Knoxville. The Citizens' Telephone Company, of which Prof. J. S. Hill is president, and W. O. Moser, of Greeneville, is manager, was organized when the East Tennessee Telephone Company purchased the Morristown's Telephone Company's system, and tried to raise the rent of the 'phones. It is said to be one of the best systems in the South. Nearly every subscriber of the East Tennessee Telephone Company in Morristown is taking 'phones from the new company and say they will quit the East Tennessee Company entirely. Not a business house which has the East Tennessee 'phone refused to take a 'phone of the new company.

The People's Mutual Telephone Company commenced on the sixth day of this month putting in its plant and system in San Francisco, Cal., under its franchise, and it intends to prosecute work as rapidly as possible, and expects to have its telephone plant and exchange in operation and completed within six months.

The Supervisors of Woodland, Cal., have accepted the bid of the Capital Telephone & Telegraph Company and have passed an ordinance authorizing the erection of poles and the stretching of wires.

As a result of a strike declared by operators in the local telephone exchange and the exposures of inadequate service incident thereto, the Seattle (Wash.) city council lately passed a resolution instructing the controller to invite correspondence with rival companies throughout the East looking toward the establishment of another system and assuring them that necessary franchises could be secured. The committee of the whole was also instructed to report to the council an ordinance declaring forfeited the franchise of the Sunset Telephone & Telegraph Company, which has over 3,000 subscribers in that city. The resolution was passed at the request of committees from merchants, manufacturers and the Chamber of Commerce, which bodies claim that the service is totally inadequate.

News from Kansas City, Mo., states that the effort to break the Bell Telephone Company's local monopoly has reached a crisis. At the last meeting of the city council the upper house passed a bill granting a franchise to the Missouri Interstate Telephone Company. This provides for improved 'phones at about half present rates, $48 a year for long distance business service, as against $96 to $108, and $36 for residence 'phones, which are now $72. Besides, the city is to have 3 per cent of the gross receipts, many free 'phones for public offices, and the privilege of municipal purchase in 12 years. The upper house passed the bill, but in the lower house it was "hung up"—sent to a committee.

The Paterson, Passaic & Suburban Telephone Company of Paterson, N. J., arranged last week to have its charter so amended as to enable the company to extend its business throughout New Jersey and into adjoining States. The company is one of the largest independent companies in New Jersey. The following directors were elected at the annual meeting: Walter Bamford, Joseph Bamford, Wayne Dumont, George Post, John K. Burke, Bernard Katz, William E. Williams, Alfred Post, J. W. Lindsay, Herbert Katz, George A. Meyers, Joseph Bamford, Jr.

At a meeting of the stockholders of the Weakley County Telephone Company, at Martin, Tenn., George E. Bowden was re-elected president; Dr. D. W. Scates, vice-president; J. H. Wilson, treasurer; Roy W. Martin, secretary, with the following directors: T. M. Ryan, T. J. Jeter, J. E. Kennedy, R. W. Martin, G. W. Hall, J. L. Smith, T. H. Farmer, C. W. Cottrell and Ted Little. The company is in a prosperous condition. There are 167 telephones in use in Martin, and about 50 have been subscribed for at Dresden.

Suit has been brought against the Chicago Telephone Company by Miss Maud Turnbull of Chicago for $20,000 damages for injuries received while on duty at the exchange, 203 Washington street. About two months ago during a storm, she received a severe electrical shock and has been paralyzed since. She is 20 years old and formerly supported her mother and a younger brother. Her condition, it is said, has not improved since the accident.

Wichita, Kan., is to have another telephone line running to Hutchinson in that State, which will connect with all of the Missouri Pacific stations between the two places. There is at present a gang of men working on the line at Haven, Kan., and the construction is being pushed as rapidly as possible. Superintendent McDaniel of Kansas City when in Wichita said: "I am well pleased with our business in Wichita, and by the first of August expect to have our new switchboard in proper condition for service."

Mr. W. T. Pittman, representing the Southeast Texas Telephone Company of Corrigan, Tex., was in Alvin recently interviewing the business men in regard to the establishment of a local telephone system for Alvin. He has decided to begin the construction of the exchange, and will start the work soon.

The Athens (Tenn.) Telephone Company is now preparing to enlarge and renovate its plant at Athens. It is placing copper wire and adding to the plant and making it more efficient in every particular. The plant is owned by Mr. Roy Smith.

The Cleveland & Cornelia Telephone Company has been organized in Cleveland, Ga. Work has been begun, and in a few weeks it will be completed.

The telephone was first practically used in England in 1876, when over 115 miles of wire existed between London and Norwich.

The Columbiana County (Ohio) Telephone Company has increased its capital stock from $200,000 to $300,000.

The Cumberland Telephone Company has opened its exchange at Clinton, La.

Application was recently made in Trenton, N. J., for a charter for the "Development Company of the Collins Wireless Telegraph and Telephone System." The capital stock has a par value of $25,000 in shares of $10 each. This company is an auxiliary corporation in the development of the system of wireless telegraphy and telephony invented by A. Frederick Collins. A patent has been applied for, and it is expected the company soon will be in a position to put the invention into practical use. Professor Collins' system differs entirely from Marconi's, and the theory on which the transmission is effected is a new one. The system has been tested in Philadelphia and proved, so it is asserted, satisfactory. If the results in the next few months should be favorable, a company of $10,000,000 capital stock will be organized and the whole enterprise put on the market.

A settlement of the strike of the Bell Telephone linemen at Rochester, N. Y., seems as far off as when the strike was begun. At a meeting recently no action of definite nature resulted, the employes and officers of the company not being able to bring about a settlement of the difficulties. The Bell Company officials are firm in their ten hour day demand, and claim that they get only eight hours of work out of the men on that basis. Their employes are demanding an eight hour day at $2.50, and allowance of time and one-half for working overtime, and double time for Sunday work.

When a test was made recently at the Bell Telephone exchange at Burlington, Pa., it was discovered that there was a break on both the Philadelphia and Trenton trunk lines. The matter was at once investigated and it was found some two miles of copper wire had been stolen from the poles a short distance from the city. The wire was taken out in sections, as it had been put in. The weight of the copper stolen was about 400 pounds.

A special meeting of the stockholders of the New York Telephone Company has been called for August 8 for the purpose of voting on a proposition to increase the capital stock from $16,000,000 to $30,000,000. At the offices of the company all information was refused, pending the meeting, as to the purpose of the proposed increase.

Several important improvements in its local and long distance systems have been recently made by the Southwestern Telegraph and Telephone Company at Dallas, Texas. Regarding these General Manager J. E. Farnsworth says: "Outside of possibly three or four of the larger cities of the United States this will be the largest and best equipped long distance office in the country. It is a better plant than there is in Chicago, Pittsburg or Cleveland. Probably only New York City itself excels us."

The New York and New Jersey Telephone Company has obtained from Justice Hooker a writ of certiorari to review the action of the State Board of Tax Commissioners in fixing the valuation of its special franchise as real property at $1,031,882. The assessment covers the company's special franchises in Kings, Queens and Richmond. The company contends that the law of 1899 is unconstitutional.

Advices from Grand Rapids, Mich., state that at the annual meeting of the directors of the Muskegon Citizen's Telephone Company a 4 per cent. semi annual dividend was declared and officers elected as follows: President, Thomas Munroe; vice-president, Thomas Hume; secretary, Joseph B. Ware; treasurer, Leigh B. Smith.

J. J. Dixon, of the Home Telephone Company, was recently in Bessemer, Ala., canvassing for the company. He is reported as saying that the local exchange will start out with about 300 'phones, and that work on the system will shortly be begun. Jonesboro, Brighton, Dolomite and Woodward, all suburbs of Bessemer, will be connected with the local exchange.

The Anderson Telephone Company, an independent concern has been organized in Indiana, with George W. Beers, of Ft Wayne, as president. The new company will have its plant ready for operation by January 1.

The Tonawanda (N.Y.) Telephone Company, a branch of the corporation which is competing with the Bell Telephone Company in the Tonawandas, is rushing its business with all the speed that is consistent with good work.

TELEPHONE INCORPORATIONS.

The Indiana Telephone Company, Hartford City, Ind.—to operate telephone lines. Capital stock, $50,000. Incorporators: W. B. Cooley, A. G. Lufton, H. D. Miller, all of Hartford City.

The American Electric Telephone Company, Jersey City, N.J. Capital stock, $3,000,000. Incorporated in Illinois with capital of $150,000.

GENERAL NEWS.

What is Going On in the Electrical World.

LIGHTING.

Altona, Ill.—The electric light plant at this place was recently destroyed by fire. It was valued at $3,000 and was owned by Mr. Tomquist.

Bellaire, Mich.—J. L. Hisey of Sparta may establish an electric light plant here.

Bradford, O—The citizens of this town are discussing the advisability of erecting an electric light plant.

Bay City, Mich.—An eastern syndicate recently asked the common council for a franchise to install an electric heating, lighting and power plant here. There is said to be sufficient capital back of the company to do all it contemplates.

Beeville, Tex.—The Beeville Light Company, with a capital stock of $10,000, was lately incorporated for the establishment of an electric light and power plant. The incorporators are P. H. Swearinger, B. Dubinski and S. J. Brooks.

Cannelton, Ind.—Local architects have submitted plans for a large electric light plant here for the use of the Indiana Cotton Mills Company.

Colborne, Ont.—The electric light station with its entire plant, owned and operated by James A. Spence, was recently destroyed by fire.

Columbus, Ind.—The city council is considering the feasibility of erecting a municipal electric light plant.

Des Moines, Ia.—The Des Moines electric light plant was damaged by a recent storm.

Durant, I. T.—The electric light company of this place was one of a number of companies to suffer from the recent fire.

Giddings, Tex.—The citizens are agitating the question of building an electric light plant.

Guthrie, Okla.—The city council has appointed a special committee to investigate the feasibility of purchasing the electric light plant, believing that better service at a less expense can be secured.

Houston, Tex.—An electric light plant to cost $125,000 is to be installed here.

Ithaca, N. Y.—The Ithaca Wall Paper Company contemplates the erection of an electric light plant of its own.

Lockhart, Tex.—George Mohle has sold his electric plant to Mr. Bachman, and the system will soon be greatly enlarged and extended.

Lyons, Mich.—This village is ready to receive bids for the improvement of the electric light plant.

Madisonville, O.—At a recent meeting of the waterworks trustees the matter of purchasing a new dynamo for the electric light plant was taken up and discussed. It was decided to purchase a 75 light dynamo of 1,200 candle power.

Manti, Utah.—Manti capitalists are figuring on an electric light plant to be built at a cost of $10,000.

Marlin, Tex—M. Levy, who contemplates the erection of a new $64,000 hotel here, will install an electric light plant in the hotel.

Mazo Manie, Wis.—The electric light plant was recently destroyed by lightning. The loss is $35,000.

McKeesport, Pa.—An ordinance has been introduced in the city council providing for the building and maintaining of a municipal light plant in connection with the waterworks.

Mondovi, Wis.—There is talk of an electric light plant being owned and operated by this city.

Morrice, Mich.—The electric light plant at this place was burned recently. Loss $10,000.

Norwalk, O.—The city council is considering the feasibility of a municipal electric light system.

Poughkeepsie, N. Y.—At a recent special meeting of the village board, the contract to build the electric light plant was awarded to William M. Sheehan & Co. of 136 Liberty street, New York City.

Prescott, Ariz.—At a recent fire that wrought over $1,000,000 worth of damage to the business part of this city, the Prescott Electric Light Company's loss was $5,000.

Quincy, Ill.—The trustees of the Illinois State Soldiers' Home have decided to ask the Legislature for an appropriation of $428,200 for the maintenance of the institution for the two years beginning July 1, 1901. An electric light plant is included in the appropriation.

Richmond, Ind.—Last week J. B. Nelson, an electrical engineer of Indianapolis, contracted with the city council to draw up plans and specifications for a municipal light plant.

Saginaw, Mich.—Bids will be received at the office of the Board of Public Works until July 27 for furnishing all material and constructing a municipal electric lighting plant in this city. Address A. Davies, clerk.

Spencerville, O.—Bonds will be issued here for the erection of an electric light plant.

Stonewall, Miss.—T. L. Wainwright, secretary of the Stonewall Cotton Mills, wants estimates on an incandescent electric light plant of 800 lights including an engine to drive the plant.

Vineland, N. J.—By its favorable action upon an ordinance introduced lately for the construction of an electric lighting plant, the present borough council sanctioned the total expenditure of $175,000 for municipal improvements, including sewerage, a new town hall, electric lights and the purchase and extension of the city waterworks.

West Plains, Mo—An election will be held July 28 to vote on the question of issuing $27,500 in bonds for the purpose of erecting waterworks and electric light plants.

STREET RAILWAYS.

Battle Creek, Mich.—Detroit capitalists are interested in the proposed interurban electric road from this city to Hastings, and it is claimed that the road will certainly be constructed, work commencing this fall. The entire right of way has been secured.

Boyertown, Pa.—It has been definitely decided to build an electric railway between Carsonia Park and this place, and operations will be commenced at an early date.

Cherry Vale, Kan.—An electric line connecting this place, Independence and Coffeyville in Montgomery County and Neodesha in Wilson County is proposed by an Eastern company which will apply for a franchise.

Concord, Mass.—Plans are underway for the construction of a new electric road, to be called the Boston & Concord Street Railway. It is proposed to start it at the northerly side of the Boston & Maine tracks in Belmont and to extend it through the towns of Lexington and Lincoln to the public square in this city.

Crawfordsville, Ind.—The commissioners of Montgomery County recently granted a franchise for an electric line between this place, Alamo and Bluff Mills.

Danbury, Conn.—The Citizens' Steamboat Line, operating the day boats on the Hudson River, the Peekskill Traction Company, and the Danbury and Bethel Street Railway Company are interested in a scheme to build a trolley line from Peekskill through this place to Long Island Sound at Bridgeport or Norwalk. A meeting of the officers of the three companies will be held in New York City this week when an organization for the purpose will probably be made.

Florence, Col.—The Florence Electric Street Railway Company was lately incorporated in Fremont, Teller, El Paso, Pueblo and Custer Counties, with a capital of $500,000. Operations will be commenced within 60 days on its erection and equipment. H. A. Cook, James Reed and Harry Robinson are interested.

Jacksonville, Fla.—W. A. Bisbee lately applied for a franchise to build an electric street railroad in this city and suburbs.

La Porte, Ind.—The city council recently granted a franchise for the building of an electric railroad to the La Porte & Michigan City Railroad Company.

Laurel, Del.—A trolley line between here and Georgetown is being talked of.

Martinsville, Ind.—It is said the Indiana Street Railway Company has purchased the Martinsville gas plant and the Commercial Electric Light Company's plant at this place. The purpose of the company in making the purchase is reported to be the building of an electric line to Martinsville.

New Castle, Pa.—G. A. Townsend, of Chicago, is about to build an electric street railway line, which will connect this city, Sharon and Youngstown, Ohio. The lines will circle the three cities and will be fifty miles in length.

Niagara Falls, N. Y.—It is expected that the new electric road from Olcott to this place will be completed by August 1st.

Omaha, Neb.—The farmers here are interested in the proposed suburban electric railway between this city and Fremont. G. R. Williams is chief promoter of the project.

Orion, Mich.—A company has been organized to build an electric railway from Pontiac to this place and Oxford. G. E. Fisher, president of the Pontiac Standard Lighting Company is the leading spirit and Detroit, Pontiac and Toledo capitalists are interested.

Peaks Island, Me.—Louis B. Wheldon, formerly general manager of the Portland & Yarmouth Electric Railroad, was recently in Portland in the interests of Massachusetts and Connecticut capitalists figuring on a scheme to equip this place with a trolley line. The enterprise is financed and Mr. Wheldon says the road will be ready for operation at the opening of next season.

Pine Bluff, Ark.—W. H. Keiser, of Chicago, was recently granted by the city council a franchise to build and operate for fifty years an electric railway in this city.

Springfield, Mass.—There is some talk in Northampton of continuing the electric street railroad to Greenfield so that there may be a continuous road between this city and Greenfield.

Tremont, Pa.—A trolley road is to be built from West Woods through this place to connect with the line operating at Tower City, Williamstown and Lykens. Over 150 miles of electric railway track will be connected, and the system will represent an investment of between $3,000,000 and $4,000,000.

COMPANY MATTERS.

Cincinnati, O.—Last Wednesday the directors of the Bullock Electric Company re-elected George Bullock president, J. S. Neave vice-president, Stephen R. Burton treasurer, and J. W. Bullock secretary.

Leavenworth, Kan.—W. Murray and Paul Geiler lately formed a co-partnership, and having purchased the Leavenworth Novelty Works will do a general electrical construction and repair business and install electric fans.

New York City—The annual meeting of the New York Electric Equipment Company, was held in the offices at No. 572 First avenue, this city, last week. The election of Samuel Insull of Chicago, Martin J. Insull, of this city, and Philip H. Klein as directors was the only business transacted.

Pittsfield, Mass.—The Stanley Electric Company made a shipment of a car load of machinery to the Standard Electric Company of California last week. The consignment is a part of the equipment for the big transmission plant, which the local concern is going to install in the mountains of California, and consisted chiefly of lightning arresters, transmitters and other instruments.

MANUFACTURING.

Itaska, Tex—J. W. Hockaday is in the market for two 30 kilowatt dynamos, direct current, moderate speed 110 volts.

Syracuse, N. Y.—The May & Cornwell Company, dealers and jobbers in electrical supplies, has been reorganized under the firm name of the R. M. Cornwell Company. This concern manufactures hoods for arc and incandescent lamps, and will soon take up the manufacture of other articles. One of the branches of the business is to install electric plants. Frederick Storer is one of the parties interested.

POWER AND TRANSMISSION PLANTS.

Bloomington, Ill.—Among the improvements which the Alton has decided on in the rebuilding of its shops here is the installation of a central heating and power plant to cost $150,000. It will be equipped with three engines of 275 horse power and one of 150.

Massena, N. Y.—A company composed of English and American capitalists has purchased 2,000 acres of land here, adjacent to the St. Lawrence and Grasse Rivers. On this land an electrical installation of considerable magnitude is in course of construction. These works will ultimately develop 110,000 horse power.

Radford, Va.—The plants of the Radford Electric Light & Power Company and the Radford Electric Railway have been consolidated under one management. The water power about three miles from here will be utilized and a complete new electrical equipment installed. T. L. Pickle, superintendent.

Richmond, Va.—The Passenger & Power Company is considering the enlargement of the power-house, and the installation of new machinery. Specifications for these changes will shortly be submitted for bids. It is proposed to increase the aggregate power by 2,000 horse power. This will provide for emergencies and insure an abundance of motive energy at all times.

AUTOMOBILES.

Chicago, Ill.—The Baltimore & Ohio Railroad, which was the first to introduce electric automobile service in connection with its passenger trains, at Washington, D. C., established the service at Philadelphia on the first of June, following immediately with the introduction of the service at Chicago from Grand Central Station this month. The automobiles are of the latest electric pattern, provided with electric lights, etc. It has been arranged, when special service is desired, that passengers on trains approaching these cities, will notify the conductor of the train, who will wire ahead, and have the automobiles in readiness when the train reaches its destination.

Minneapolis, Minn.—Articles of incorporation of the Northwestern Motor-vehicle Company were filed a short time ago, and within a few weeks this city will have a public automobile cab service, operated along the same lines as the public cab service in the large Eastern cities. The officers of this new concern are H. H. Thorpe, president; Edwin Holt, vice-president, and W. E. Wheeler, secretary and treasurer. This company will also operate a line of cabs in St. Paul.

New York City.—A recently organized concern known as the Stanley Automobile Company will manufacture automobile patents in this city. The directors are: Amzi L. Barber, S. T. Davis, Jr., Frederick D. Foster of New York City; David S. Walker and John B. Walker of Tarrytown.

West Superior, Wis.—Manager M. R. Martin of the Superior Cycle Company is figuring on putting in an automobile manufacturing department in his cycle factory. He has already purchased considerable machinery for the purpose of making these machines and is now working on his first product of the kind.

Williamsport, Pa—The organization of a company to manufacture the Stutzman automobile, and opening the books for stock subscriptions, places the matter in proper shape for the public to take hold of the enterprise.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16⅝c.; Lake, 16¼@16½c.; casting, 16@16⅛c.

The American Bell Telephone Company has declared a dividend of 2 per cent., payable July 28.

The Calumet & Hecla Mining Company has purchased the Shelldrake Lumber Company for $650,000.

The Harrisburg, Pa., Traction Company's receipts in the last fiscal year were $332,582.77, an increase of $10,000 over the previous year.

The stockholders of the Danville, Va., Railway & Electric Company have authorized an issue of $400,000 40 year 5 per cent. bonds. Part of the proceeds will be used for extensions.

The American Air Power and the Compressed Air companies have consolidated with a capital of $8,000,000, $755,000 6 per cent., preferred and $7,245,000 common stock.

The directors of the Edison Electric Illuminating Company of Boston have declared a quarterly dividend of 2 per cent., payable August 1 to stockholders of record July 18.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 16@18; New York Electric Vehicle Transportation, 8@8¼; New England Transportation, 1½@4½; Gramophone, 35@40.

Exports of general merchandise from New York last week were valued at $11,742,741, against $9,942,146 the preceding week, and $7,162,041 the corresponding period last year; from January 1 exports aggregate $324,976,594, against $252,601,828 the same period last year.

The New York Motor Vehicle Company, P. H. Flynn, president, capital $500,000, all paid in, which bought the Worcester Cycle Company's plant in Middletown, Conn., will start at once with 200 hands. The company is said to have orders for $1,000,000 worth of vehicles.

Within a few days the Metropolitan Street Railway Company of New York City will have completed a cross-over connector at Manhattan street and Amsterdam avenue connecting the present terminus of the Sixth and Amsterdam avenues line at 125th street with the Amsterdam avenue branch of the Third avenue system.

Judge Arnold in Common Pleas Court No. 4 has dismissed the demurrer and allowed the defendants to file an answer in the equity suit instituted by William L. Elkins and others against Whitney & Stephenson and others to recover $65?,000 in bonds and securities which figured in the consolidation of the Pittsburg traction companies in 1896.

Advices from Seattle, Wash., state that the Grant Street Electric Railway Company, which has for some time been controlled by the Seattle Railway Syndicate, has transferred its entire property to the Seattle Electric Company. The earnings of the Seattle Electric Company for May are: Gross earnings, $92,800; operating expenses, $64,458; net earnings, $28,342.

Bondholders of the United Electric Securities Company are notified that the American Loan and Trust Company, trustee under the several trust indentures of the company, has called for redemption at 103 and accrued interest to August 1, 1900, collateral trust 5 per cents of the company. Twenty-seven bonds of the fifth series are called, three of the sixth, the entire outstanding issue of the eighth series, and 117 of the eleventh series.

The North Jersey Street Railway Company, has filed with the City Auditor of Newark, N. J., the annual statement of its receipts for the year ended April 30, 1900. The report shows that the gross receipts on all the lines operated by the company were $2,653,990. The receipts in Newark, based upon the proportion of mileage within the limits of the city were $1,547,8?2. The company has paid to the city as a franchise tax 5 per cent.—$77,390—of the earnings of its lines in Newark.

The trustees of the Massachusetts Electric Companies have called a special meeting of the shareholders to be held on July 30, the transfer books for both preferred and common shares will be closed from July 21 to July 31. The special meeting is called for the purpose of confirming the purchase of the South Shore & Boston Street Railway Company, and securing authority to issue new stock on the basis of one share of preferred and ¾ share of common stock for each share of South Shore & Boston stock. There are 6,900 shares of this stock calling for the issuance of $690,000 Massachusetts Electric Company's preferred stock and $517,500 common stock.

Justice Dugro, in the Supreme Court recently granted the Metropolitan Street Railway Company of New York City a writ of certiorari directed to the Municipal board of Taxes and Assessments, for a review of the assessment placed on the company's property for the year 1900, and returnable in October. The company alleges that its capital stock on the second Monday in January last was $45,000,000, of which $44,928,900 was paid up. The assessment fixed by the Tax Board was $4,022,800 on its real estate and $45,000,000 on its personal property. On application the Tax Board reduced the assessment on the personal property to $10,621,789 and to $4,017,800 on the real estate. The company claims these assessments are illegal on the ground that its indebtedness amounted to $38,983,233.75, and that its stocks in other companies, which were subject to taxation, amounted to $14,542,172. It claims that the total amount of its indebtedness and its holdings of stock in other companies should have been deducted by the Tax Board from the assessment.

The Appellate Division of the Supreme Court has decided that the Brooklyn Heights Railroad Company of the Rapid Transit system has the right to charge a ten-cent fare to Coney Island. The decision was rendered in the suit of Arthur Barnett against the company to recover $65 damages for being put off of one of the Third Avenue cars at Twenty-second street, Brooklyn, because he refused to pay the additional 5 cents fare demanded. All the Justices of the Appellate Division concurred in the decision, except Presiding Justice Goodrich, who did not vote. The decision was written by Justice Hirschberg, who stated that the grounds upon which the decision was based are that the Brooklyn Heights Company legally leased the Sea Beach Railroad; that the lease carried with it the right to charge an extra five-cent fare; that the Sea Beach Road received its charter before the one-fare law was passed; that the one-fare law did not refer to roads with a steam railroad franchise.

The Gold and Stock Telegraph Company, which is controlled by the Western Union Telegraph Company and which recently became engaged in a controversy with the Chicago Board of Trade on July 19, issued the following notice, signed by Thomas T. Eckert, as president: "The Chicago Board of Trade some time ago submitted a proposition to the Western Union and Postal Telegraph Companies, which demanded of the companies exorbitant financial terms, combined with impracticable conditions for the distribution of its market quotations. The companies endeavored to meet the views of the Chicago Board of Trade in every way possible, having made a liberal counter proposition. The result is that the Board has declined to accept the proposition of the telegraph companies, and has given notice that its market quotations will be withdrawn from the telegraph companies on August 1 next. This action on the part of the Chicago Board of Trade will after July 31, 1900, necessarily deprive our subscribers of the Chicago Board of Trade quotations as they have heretofore been sent out. We therefore give this notice to our subscribers that they may govern themselves accordingly."

EDITORIAL NOTES.

Electric Brakes Superior to Hand Brakes for Street Cars.

It is gratifying to note that the State Railroad Commission at Albany, N. Y., has at last completed its report on the tests of street car brakes. Last winter, as will be remembered, the Commission took up this question of the braking of street cars and issued a call to inventors of various forms of electric and other power brakes, inviting them to make a public test of their devices on cars placed at the disposal of the Railroad Commission by the Metropolitan Street Railway Company of this city. This invitation met with hearty response, and as a result experiments extending over several weeks were carried on on one of the lines owned by the above street railway company. The brakes tested were of almost every conceivable description, and the report just made public by the Commission treats of the results of the tests. The Commission says it was led to order the tests "by the alarming increase in the number of accidents happening on the street roads throughout the State, which the Board believed to be due to a large extent, to the inefficient brakes in use."

The report notes that "to-day there are electric street cars in service on various lines that weigh as high as twenty-three tons complete and have a speed capacity of over fifty miles an hour." It is stated, however, that the cars used in the larger cities weigh from ten to seventeen tons and are operated at a maximum speed of twenty-five miles an hour. In smaller cities the weight and speed are less.

In all, twenty-five varieties of brakes were tested on wet and dry rails. It was found that the average stop when the rails were wet was 71.73 feet and on dry rails 60 feet.

"Except in special cases," says the Commission, "where the liability to accident is very remote, the ordinary hand brakes now generally used should be replaced."

The Commission in its report does not recommend any particular make or type of brake, but it states that in order of merit, an electric brake stood first in the tests, friction brakes next, a hand power brake third and air brakes fourth.

The State Railroad Commissioners' report bears out the claim all along made by ELECTRICITY that there are excellent electric brakes on the market that should be adopted. That a more powerful braking mechanism than the hand brake now generally in use is needed is forcibly brought home by the number of accidents that are constantly occurring in the crowded thoroughfares of this city. Such being the case now that the State Railroad Commission has decided after numerous tests that an electric brake is far superior to the hand brake, if the principal railway companies do not see fit to at least endeavor to protect the lives of the citizens by making use of up-to-date appliances, drastic measures should be adopted at Albany to compel them to do so.

* * *

Some Facts About the Anglo-American Telegraph Company.

During its existence the Anglo-American Telegraph Company has laid eight cables, the history of which is quite interesting. The first was laid in 1857-8, the others in 1865, 1866, 1869, 1873, 1874, 1880, and the last in 1894. The 1857-8 cable was a total failure; it broke in 1857, and then failed after a brief existence in 1858. But it must be remembered that not only the making and laying of cables was in its infancy at that time, but navigation by steam was still in its early days, and thus the cable project was abandoned for the time; in fact, nothing practical was done until 1865 when another attempt was made, the result being that the cable broke when about half laid, but the enterprise was completed in the following year. From 1866 to 1869 there were uninterrupted cable communications across the Atlantic; in the following year there was an interruption of thirty-one days, the next year, 1871, of one hundred and seventy-one days, followed by a year of successful operation with no interruptions in 1872. In 1873 this cable died, so that its total length of life was seven years.

The 1866 cable showed its first flaw in 1867, when there was an interruption of 99 days; in 1868, of 69 days; in 1869, of 93 days; in 1870, of 153 days, and in 1871, of 154 days. Then followed two years of uninterrupted business, followed, in turn, by an interruption of 92 days, with no further interruptions until 1877, when this cable also died, after a life of ten years.

The cable that was laid in 1869 showed no interruptions until the year 1872, and then only for 19 days; in 1873 there was a total interruption of 35 days, none in 1874, 1875, followed

Digitized by Google

again by an interruption of 61 days in 1876, and this again followed by two years of uninterrupted business, bringing us up to the year 1879, when there was an interruption of 169 days, followed each year by interruptions as follows: in 1880, 50 days; in 1881, 202 days; in 1882, 186 days, and then another year of uninterrupted business. The interruptions for the next few years were as follows: in 1884, 8 days; in 1885, 65 days; in 1886, 87 days; in 1887, 343 days; in 1888, 216, and in 1889, 78 days; in 1890 no interruptions; in 1891, 56 days; in 1892, 134 days, and in 1893, 272 days; thus, during the total life of that cable, amounting to 24 years, the total number of interruptions was twenty, and the total number of days lost was 1,981, or about five and one-half years out of its life. The cost of the repairs to the company was, in round numbers, $150,000, and 1,100 miles of cable were employed in the repairs. It is an unfortunate fact that there are two ridges in the Atlantic ocean bottom, and it is over these two ridges that the breaks are always reported to have occurred.

The cable laid in 1873 seems to have been more fortunate, as no interruptions occurred until 1880 when thirteen days were lost; followed by another period of successive operation lasting until 1891, when there was a loss of 46 days, followed by another of six days in 1895; or a total interruption of 65 days, and of this the longest interruption at any one time was one and one-half months.

In the cable laid in 1874 there were no interruptions until the year of 1880, since that time there have been six interruptions, the longest of which was one year and two weeks. In 1884 the Commercial Cable Company laid a cable across the 1874 cable, and, while it might be simply a coincidence, yet it is rather noteworthy that the 1874 cable broke in the neighborhood of that crossing. An expedition was sent out to repair it, but failed, and not only failed, but increased the break until it was 125 miles in length. The following year the company repaired the break at a cost of 273 miles of new cable. The cost of the two expeditions for that purpose was in the neighborhood of $435,000.

The 1880 cable showed its first break in 1883, when there was an interruption of 42 days, followed by another of 16 days in 1884; of 21 days in 1891, and of 30 days in 1896, or a total interruption of 42 days. The latest cable laid by the Anglo-American Company is that of 1894, in which there have been no interruptions up to the present time.

The general impression seems to be that better material is used in the modern cables than was the case in those of the earlier construction, but it is claimed by the officials of the company that there has been no material improvement between the years of 1865 and 1894, and, in one particular element of construction—gutta-percha—there has been a very material deterioration, as there is so much adulteration, but in addition to this it must be remembered that a harder iron wire is being employed, and thus a greater breaking strain is being secured. The largest improvement is the covering of the iron wires with thin gutta-percha, which was first employed for this purpose in the cable of 1880; this prevents the wire from coming in immediate contact with the ocean bottom, and as a consequence, prevents oxidization.

From the above it will be seen that the Anglo-American Company has laid eight cables, and that it is at present operating four, all of which go in the same direction. Of the seven Atlantic cables belonging to the Associated Companies, Anglo, Direct and Western Union Companies, as many as four have been broken at one and the same time, as was the case in 1894, when four out of the seven were out of operation, but this was the only instance in which the number ran over three.

* * *

A High Speed Electric Railway Scheme.

From all parts of the world come reports of projected high speed railways, but probably the most daring proposed undertaking of all in this line is fostered by a company in New York City, capitalized, so it is alleged, at $5,000,000. This concern will in the near future construct an overhead structure on which specially designed cars operated by electricity will, it is fondly hoped by the promoters, travel at a rate of speed of 200 miles an hour.

From the comparatively meagre amount of information obtainable the proposed line resembles in several respects the invention of Mr. Behr in England, descriptions of which have appeared from time to time in these columns. The cigar-shaped cars constructed of aluminum will rest on a single rail laid on a trestle at adequate height above the ground, and will be propelled by a current of electricity taken from a modified form of third rail. Referring to the system the inventor says:

"Our cars are long and narrow like arrows, and the air resistance is about one-fourth that which any other system meets, for a vehicle carrying the same number of persons.

"Then, too, we have the bicycle system, and there is so little friction that only one-tenth of the power required on other systems is needed. A man who has only one-eighth of a horse-power can propel a wheel at the rate of nearly sixty miles an hour. This is because the whole weight, or nearly all of it, on a bicycle falls on the center of the machine. And as only one-tenth of the horse power is used, the weight is tremendously reduced.

"Our cars are light, being constructed of aluminum and only four feet in width, and are remarkably strong. They are to be lined with asbestos, and the sides will be perfectly smooth. They will be warm in winter and cool in summer.

"One beauty of our system is that it is impossible for our cars to fall from the tracks. The traction wheels, of which there are four in each car, carry roller journals and fit into the single traction rail. The magnetic brake when applied grips this rail securely. The rail is fastened to the ties by a single rivet of steel which goes through its center.

"Now, the security comes from the eight guide wheels which act as the trolley. They descend around from the bottom of the cars to the bottom of the ties, where there are two charged rails, one to take in the current through an insulated wire and the other to carry it away. These operate on springs and are under the rails. This makes the charged rails face downward under the ties, and so does away with the possibility of getting shocked on the track."

As compared to the ordinary railway car, the vehicles of this system will have but one-tenth the weight, will require but one-tenth the power and will, owing to their shape, offer but one-fourth the resistance to the air. They will be sixty feet in length, four feet wide and seven feet high, divided into twelve compartments, each accommodating four passengers.

Other advantages of such a system are set forth by the optimistic inventor as follows:

"With our elevated transcontinental railroads there will be no grade crossings, the road will be out of the snow in the winter, out of the dust in the summer; there will be no necessity for fencing, none for ditching or ballasting.

"The old trouble of the right of way will be done away with as the farmer can plough his field right under our structure without danger. The speed will not have to be diminished in running through towns as it does on the steam roads.

"As there is only a pivot to turn on, the sharpest curves can be made at top speed with perfect safety. In fact, in my experiments on short distance roads, I have turned twenty-five foot radius curves at a speed of 106 miles an hour."

Commenting on the future of such a system the same gentleman adds:

"I believe that this system will in time do away with much, if not all, of the steam passenger traffic between cities and in intramural railroads. It will undoubtedly take the mail and express business, but as it now stands is hardly fitted for freight."

Two hundred miles an hour would unquestionably be a great step in advance over our present methods of railroad travel. Unfortunately in this world "all that glisters is not gold," and it remains to be seen whether this high rate of locomotion can actually be attained in ordinary practice. As the company is said to be about to construct a line of this nature from Philadelphia to Atlantic City, a distance of fifty-five miles, an excellent opportunity should be afforded those interested of ascertaining whether the expectations of the inventor are fully realized.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

The Prince of Naples, who succeeds to the throne of Italy on account of the assassination of his father, speaks several languages perfectly, and will be, it is said, the most accomplished monarch in existence. For the past five years he has been a close student of electricity, and it was his intention to tour this country next year and inspect all the large electrical works here.

Excellent results are reported to have been obtained by the French Government from experiments made with wireless telegraphy. It was found that communication could be obtained with comparative ease between the shore and a ship at the distance of sixty miles, only the height of the mast of the ship preventing longer distances being attained. In consequence of this success it has been decided to equip the French Mediterranean squadron with the necessary apparatus.

Following up the policy of substituting electricity for steam at all available opportunities, the Pennsylvania Railroad Company has equipped its machine shop boiler flange department with a complete set of electric motors, which are running all the heavy steel rolling and cutting machines in the shop. The experiment has proved perfectly satisfactory in

Digitized by Google

every sense. A few figures recently compiled show that the cost of running the department has decreased enormously since the introduction of electricity. Machines which formerly cost from $2 to $5 per day to operate are now run for an average of eight cents. The success of this departure will have wide bearing favoring similar innovations in other shops.

A NUMBER of people at McKeesport, Pa., are interested in the use of electric light in connection with the stereopticon, and Mr. George Behr, chief electrician of the tube works of that city, has constructed an electric lamp of his own device, making tests in the presence of several persons, which have proven that as brilliant and noiseless a light can be secured from electricity as from any other source for stereopticon work.

WILLIAM E. HEAL, ex-county treasurer of Marion, Ind., states that he has his new electric glass-melting process almost completed. It is somewhat similar to the system used at Niagara Falls for producing carborundum. He claims that he has succeeded in reaching a temperature of 7,000 degrees, while that reached by natural gas is not more than 2,700 degrees. He has shown the process to a number of prominent glass manufacturers, and they are unanimous in the belief that it will revolutionize the industry. It will require only a small part of the gas now used in the tanks to furnish the necessary power to operate the dynamos for the electric process, and thus will cheapen the cost of the production of the ware.

FRANCIS G. HALL, JR., and Irving E. Burdick, seniors in the Sheffield Scientific School at Yale, have perfected a new electric rapid fire gun. Its inventors believe that the weapon is to become an important piece of ordnance, and with it they hope to revolutionize the use of automatic guns on modern naval vessels. Mr. Hall and Mr. Burdick came to public notice over a year ago by inventing the Yale submarine arc lamp, which is now in use by the United States and Russian navies. They have been devoting their spare moments at New Haven, Conn., for the past seven months to building and perfecting their gun. The gun resembles the Hotchkiss, being mounted on deck in a similar manner. Its distinguishing feature is a device by which the gun can be fired by electricity from any part of the ship. It is asserted that the device is entirely different from any other for which patents have been granted. Messrs. Hall and Burdick organized the Naval Electric Company, with an office in New York City, to carry on their electrical work. For several years prior to this their work has been done under the name of the B. & H. Electric Company, but so much marine work has offered itself that they were advised to devote their whole time to it after finishing at Yale.

A COMPANY was incorporated in Tillamook, Ore., in April, 1898, to operate a sawmill by electricity, and since that time the incorporators have been constructing their novel mill. The mill commenced cutting lumber about two weeks ago, and proved beyond a doubt that the plan of operating a sawmill by electricity is feasible. The company generates its electricity by water power. The water is flumed from a small stream, and runs a 50 horse-power water-wheel, in connection with which is a dynamo to generate the current to operate the mill. Wires are strung from the power house to the sawmill and are attached to the saws and other machinery of the mill. The peculiarity of the electric sawmill is that the carriage is above the log and carries two saws. They are so fixed as to cut both ways, making two cuts at the same time, and, instead of having to bring the carriage back and commence cutting at the same end each time, the saws cut as well coming back and they cut a log of any size. It is claimed that the mill will cut lumber at one-half the cost of other sawmills.

HUGH J. MCGOWAN, president of the Indianapolis Street Railway Company, is completing the plans for some novel floats that will take part in the Fall Carnival pageantry in October. Street cars will be used, and it is claimed the floats will be the finest in point of decoration ever seen in any festival of the kind.

WHETHER or not the Republican National Committee adopts the project favored by some of its members of stationing in available places throughout the country graphophones reciting speeches by prominent Republicans, the broaching of the project, says the St. Louis "Republic," shows that conditions have changed materially from those which prevailed during the campaign of 1896.

SWITZERLAND has, up till now, not been noted as a center for steel production, though her engineers have long held a high position in the mechanical world. Recently, however, a company has been formed to work the great deposits in the Bernese Oberland, where there are many million tons of ore available, averaging 50 per cent. of iron. It is intended to attempt to smelt the metal electrically, the large water power, cheaply obtainable, giving the plan a reasonable prospect of success.

IT is stated that tests recently made in Germany with electric motor vehicles show that the most favorable result, so far as capacity is concerned, which a superficial comparison of the tests disclosed, was the equivalent of a working output of about 60 watt-hours per ton of rolling weight over a distance of .621 of a mile. Steering and brake tests were also made with different speeds and conditions. These tests proved on the whole satisfactory. In testing the extreme possible speeds of the competing vehicles, one of the passenger cars traveling at the rate of 11.7 miles per hours showed a battery capacity of 87 watt hours per kilometer-ton. No light is thrown upon the question of durability of the batteries.

MANUFACTURERS of electrical supplies are endeavoring to obtain a revision of the railroad freight classification, which rates all of their products as first-class freight and some articles as double first-class. A suit in the United States Court is threatened to enforce the Interstate Commerce law provision against discrimination. Complaint is made that the electrical supply industry is seriously hampered because the railroads charge the highest rates for carrying electrical goods.

THERE has been some criticism of the New York Electric Vehicle Transportation Company, which some time ago bought the property and franchises of the Fifth Avenue Stage Company, because it has thus far failed to put more than three or four electric stages on the route and has continued the stage service with the antiquated stages that it received from the old company. The statement was made at the office of the Electric Vehicle Company that it was still the intention to substitute the new system for the old horse-power system at the earliest possible date. The trouble was that the subject of electrical stage service was comparatively new in this country and no one had had experience enough to know just what the requirements of the new service might be. When the old company was taken over by the new, three or four electrical stages were placed in service as an experiment and to study and complete the data necessary to the change of system. These experimental stages have been in service ever since and something of the requirements has been gathered from the experiment with them. New electrical stages are now in process of construction at the works of the company at Hartford, Conn., and when they are completed they will be placed in service on Fifth avenue. The delay has been due to the many new propositions to be met, and the time required to manufacture the new vehicles intended to meet modern conditions.

CONEY ISLAND has a gospel lighthouse. The light, an enormous electric affair, can be seen, not only throughout the Island, but for miles beyond. It is 85 feet above the ground, and it turns slowly around the compass. On the great light appear the words "Jesus Saves," in large text. The light revolves from north to east, then to south, to the west, and back to the north again. It was placed in position for the first time last Saturday night on the top of the tower which is built alongside the mission house in Surf avenue, and many a reveler staggering along paused as his eyes caught the words in the air.

ADVICES from Cumberland, Md., state that work on the new third-rail system, which the Baltimore & Ohio Railroad is installing in the Belt Line tunnel to take the place of the present overhead system, is being rapidly pushed to completion. When it is finished electric motors will be more extensively used in hauling trains through the tunnel. The current for the motors will be supplied by a rail running outside the wheel rails. To minimize the danger of shocks to workmen and others who may be obliged to use the tracks, the rail is encased between two pine planks set on edge, the top edge of the planks extending a little above the rail. The insulators consist of blocks of reconstructed granite.

STORAGE BATTERY cars were run last Saturday evening for the first time over the crosstown line of the Metropolitan Street Railway Company's system, connecting the West 42d and the East 34th street ferries. The cars were of the underground trolley type, the batteries being located beneath the seats.

WE understand from a Reuter's telegram, says the "Electrical Engineer," London, that the Powers are considering the laying of a new cable between the present seat of disturbance or base of operations in China, and some points such as Shanghai, Port Arthur, or Yokohama, through which more speedy communication could be had with Europe. According to the present tentative arrangements the expense of the undertaking will be borne jointly by the Powers. It is probable that the United States will be able to lay the cable in the shortest time, owing to the fact that a cable which is intended for inter-island communication in the Philippines could be diverted to China.

FIRE PROTECTION FOR LIFE AND PROPERTY.

BY JEAN WETMORE.

The means for protecting life and property against fire has not kept pace with our structural and commercial metropolitan growth.

Our attention has repeatedly been called to the highly inflammable condition of the wharves and storehouses lining our river fronts, and to the millions of dollars worth of property either received from, or ready for shipment to foreign ports, all stored in flimsy, highly inflammable buildings, that can scarcely be truly dignified by any other term than sheds built on wooden piles. Our commerce has been rapidly increasing while our methods of preventing and fighting fires, and protecting life and property, have not essentially been improved during a decade.

It is conceded that new forms of quick fastening buckles have been substituted on the harnesses of fire engine horses, new hose couplings employed, and furthermore progress is indicated by adding clergymen to the fire fighting corps, but the fact is apparent that our present system of dragging inefficient, cumbersome, antiquated apparatus through our highly congested streets to reach distant conflagrations is as ridiculous in the light of well-known means, as are now the little hand pumps our travelers still find in foreign cities.

The recent Hoboken disaster is an example of others that may any day be repeated when aided by favoring winds. An immense amount of valuable, highly combustible property, piled upon wooden wharves, resting on wooden piles all covered with a highly inflammable, sunbaked, wooden, boxlike superstructure, sheltering cotton bales, oils, whiskey and what not and helplessly sandwiched in between—the great transatlantic prides of a great navigation company. What a travesty on human reason and foresight! When a fire occurs under such conditions can we consider it a visitation of Providence? With the whole Atlantic to draw from there was scarcely an effective gallon of it to be utilized at the critical moment. The unavailability of fire engines and fire boats gave another fallacious example of attempting to utilize heavy transportable fire fighting machinery.

Our great and rapidly growing shipping interests, as well as our modern office structures, require commensurate improved facilities for fire fighting protection.

We instantly communicate our thoughts to distant friends, we operate large industries from power generated miles away, we pull a fire alarm box and instantly scores of men, horses, ladders, heavy steam engines and coal supply wagons are started clattering through our crowded streets, which in the course of time arrive at a fire, often when it is too late. They stand by while $3,000,000 goes up in smoke and 200 wretched human beings die in terrible agony. They then take their inefficient clap trap back, and patiently wait for another alarm, and yet, the hand that pulled the box, could as easily have instantly switched into local electrically driven pumps a thousand available horse power, from central railway and electric light stations.

The money lost in the Hoboken disaster alone would have equipped the shipping interests on both sides of Manhattan Island with adequate and instantly available electric fire protection.

To secure this protection the city has no need at present of erecting expensive power plants, or to build conduits or fill them with costly insulated wires. These adjuncts already exist and are in constant operation day and night; they never shut down.

The dock owners have only to equip each dock with an electric pump and connect them by means of iron piping laid underneath, and out of the way, with iron hydrants conveniently located and supplied with dirigible nozzles capable of sweeping the dock throughout its whole length, and as well capable of playing on the adjacent wharves when necessary. Hose, which often proves worthless in such cases of need, may not even be employed; the operation of pulling down a switch will enable each dock to instantly borrow for temporary emergency purposes electric power from the existing electric light and electric railway mains, in almost unlimited quantities. It is to be further noted that each central station almost invariably has a reserve equipment for extra occasions.

By the time a cumbersome fire engine could answer an alarm, a dock watchman unaided would have all the freight washed into the river if he so desired.

Such an apparatus would be quite inexpensive, and this is why we add "that electricity, instantaneous in its operation, capable of transmitting great power effectively over long distances, practically annihilating time and space, will eventually be universally used in fighting harbor fires."

Experiments were recently made at Brest, in France, with wireless telegraphy, by Lieutenant Tissot. It is not stated what system was made use of, but he was enabled to receive very clear messages from the Masséna, 35 miles at sea. The Friant, arriving in port, also sent messages, and though sent to the same receiver they were only slightly mixed with those of the Masséna, and could be easily read. These and other experiments which have been made are with the view of the adoption of aerial telegraphy in the French navy.

ELECTRIC TRACTION ON CANALS IN BELGIUM.*

For some time past experiments have been tried in both Germany and France, with a view to employing electricity for towing on canals and rivers, but though the former country enjoyed all the benefits of State aid, the result in neither case was such as had been hoped by those who realized the wide field of usefulness open to the system.

The question was fully discussed at the Belgian Congress of Navigation held in Brussels on April 9, 1899, but none of the visitors brought forward any scheme of real practical value. M. Léon Gérard, late of the Brussels University, an eminent Belgian electrician, who has devoted much study to the transmission of electrical power to long distances, advanced, however, such an admirable and feasible project for the desired purpose, that all those present acknowledged that M. Gérard's designs left little to be desired, and that the difficulties previously met had been effectually surmounted.

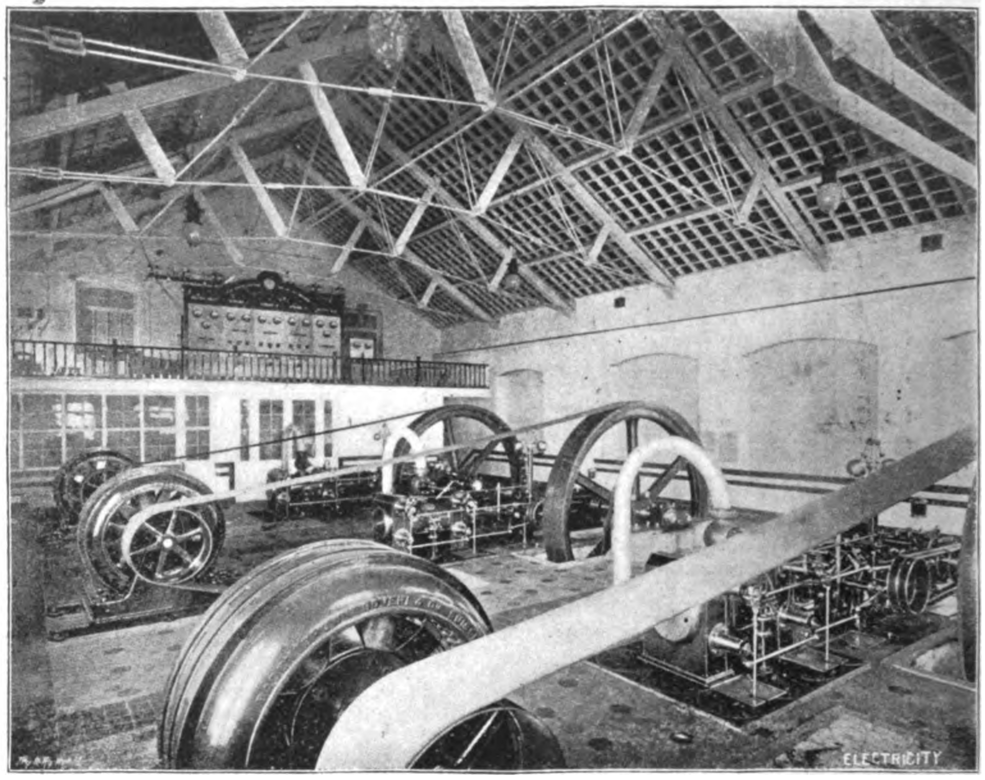

FIG. 1.—ENGINE ROOM AT OISQUERCQ SUPPLYING CURRENT FOR CANAL HAULAGE.

The "Compagnie de Traction Electrique" was then formed with M. Gérard as managing director, and his system has been installed on the important canal which runs between Brussels and that great center of the Belgian iron industry, Charleroi. This canal has a length of 50 miles, and there will be two depôts on it. One will be established at Roux, a village about 10¼ miles from Charleroi; the other is at Oisquercq, about 16¼ miles from Brussels.

Here three Germeau boilers of the Cornish type, two views of which are shown in Figs. 1 and 2, with two furnaces of 75 square meters (807 sq. ft.) of heating surface, work at a pressure of eight atmospheres (118 lbs. per sq. in.) The steam from these, after passing through a superheater is conveyed by a double system of piping to three single cylinder engines (Bollinckx-Corliss) of 150 horse-power, which run at 85 revolutions. The flywheels of the engines

* From the "Tramway and Railway World," London.

Digitized by Google

drive in their turn, by means of cotton belts, three-phase alternators, made by Brown-Boveri, at 400 revolutions. Fifteen amperes are thus supplied at 6,000 volts, with 40 alternations per second. The alternating machines have 12 inductors, only half the poles being wound. The armature has a star-shaped winding, the conductors being insulated by means of mica. The exciters are four-poled Eickmeyer wound dynamos, which are driven from an extension of the alternator shaft. They develop normally at 42 volts, 12 amperes, and are designed so that one machine is capable of exciting the three alternators, even at the maxium load.

The switchboard, which is of white marble, is divided into five panels; three of these being for generators, and two for the sections of the line running up and down stream. The lower part is reserved for the exciters, which are coupled on the same bus bars. The feeders, which are entirely overhead, except at certain road crossings; are carried on yellow Russian pine poles, which are creosoted and placed about 123 ft. apart, and vary in height from 35 to 37 ft.

They carry two circuits of bare conductors, comprising:

Firstly, three primary wires of decreasing

FIG. 2.—POWER STATION.

section for 6,000 volts pressure. For the first four kilometers they are of the diameter of 5.5 millimeters, the remainder being of 3.4. The wires are placed on large blue vitrified three-bell insulators, sealed with sulphur, and tested to 12,000 volts.

Secondly, three secondary wires at a tension of 600 volts, of the uniform diameter of 5.5 mm. These are borne on double-belled white insulators, except in certain places where they have been made brown to diminish their visibility. There are in addition two telephone wires. The primary and secondary wires are throughout separated by a protecting net composed of three iron wires of three millimeters diameter, joined every three feet by a wire of two millimeters diameter, and earthed by lightning rods at each post. The lightning conductors have been made of barbed wire, so as to prevent the poles being scaled.

The lower conductors are about 18 feet above the ground, but at road crossings this height has been increased to nearly 20 feet, and the security of the traffic passing underneath is guaranteed by wire gauze which completely envelops the primary wires. Besides this there is a side net for the secondary wires, all being earthed.

Every three miles a shed has been built, in which is placed a transformer of 36 kilowatts, entirely submerged in oil. The transformers are protected by fuses on both primary and secondary wires as well as by lightning arresters. The fuses are easily removed, and thus serve to cut out any special transformer from the general circuit when necessary. Figs. 3 and 4 show the exterior and interior of the transformer huts.

The tractors, built entirely of steel, are provided with a motor of 5 horse-power, tested to

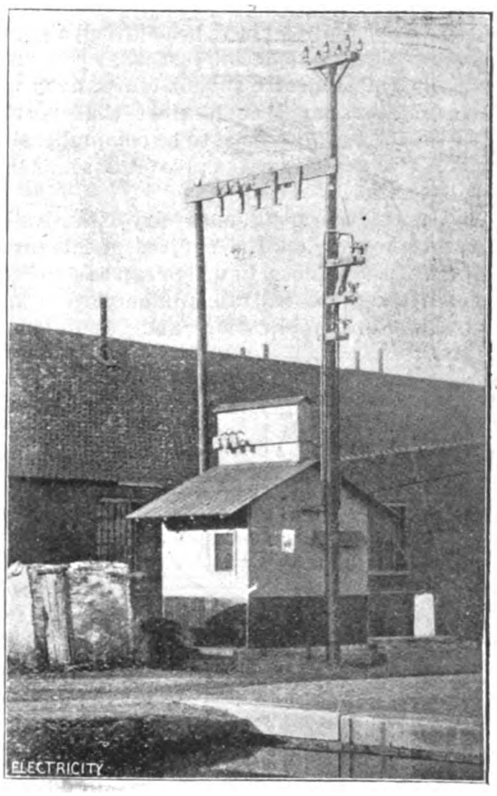

FIG. 3.—EXTERIOR OF TRANSFORMER HUT.

10. They work at an average of 7 horse-power, except on occasions of emergency when they can develop 20 horse-power. They weigh from a ton and three-quarters to two tons. Section

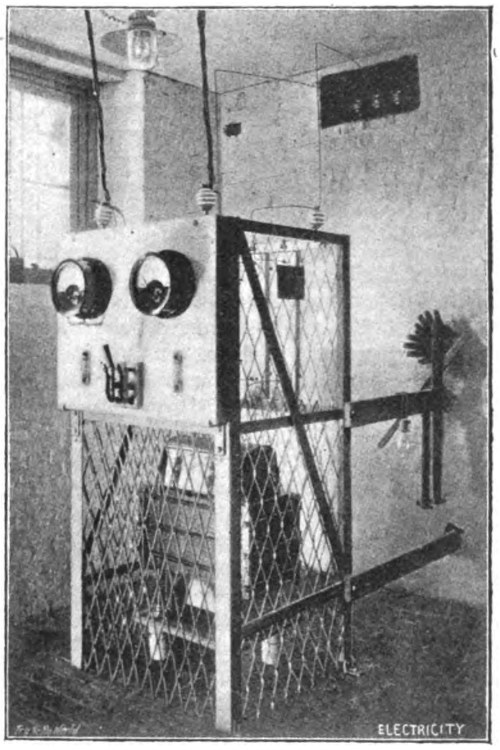

FIG. 4.—INTERIOR OF TRANSFORMER HUT.

and plan of the tractor, etc., are shown in Fig. 5.

The outside dimensions of the tractors are: Total length, 7 ft. 9 in., distance between the axles, 5 ft. 10 in.; width, 3 ft. 5 in.; height, 4 ft. 6 in. in one type of machine and 4 ft. 10 in. in another.

The motor, which is of 3-phase type, works at twice its normal load for ten minutes without an increase in temperature of more than 50 degrees, the efficiency of the machine being 80 per cent. A leather pinion with 12 or 16 teeth, according to the type of machine, is fixed to the axle of the motor and drives a shaft running at 116 revolutions. On this shaft is a clutch with which it is possible to drive a chain connected with the driving axle or with a conical winch on the other side. This arrangement forms, indeed, the specialty of M. Gérard's machine, and it will be easily understood that the extra power gained by the use of the winch is of immense service at certain times. Not infrequently the boats become wedged across stream, or other accidents happen which demand considerable power to start them again. The tractor itself might get into such a position (for the paths are not wide and are generally bordered by a ditch) from which only a very great amount of power could ensure its escape. The winch can develop an effort five times greater than the ordinary propulsion axle. The speed obtained from the tractor varies from 2 to 4.8 kilometers, with a mean effort of 75 kilog. per square centimeter (1,103 lbs. per square inch), while a maximum effort of 300 kilog. per square centimeter (4,412 lbs. per square inch) can easily be obtained on good ground. The tractor has four wheels—two for guiding in front and two for driving behind. The driving wheels have ball bearings, and are 200 millimeters wide, while those for guiding measure 120 millimeters.

There are two seats for the driver. Ordinarily he occupies that in front, and has under his control a three-pole switch for reversing the direction when necessary, the starting resistance, a brake and the clutch lever.

The tractor is supported on the frame by eight springs on each side, and is so arranged that no matter how uneven the road may be the wheels are always on the ground.

The current is collected by means of a triple trolley. Each of them has two wheels of aluminum bronze, with ball bearings and aluminum frame, and is provided with balancing weights. The trolley weighs 820 grammes.

Two spiral springs have been attached to the flexible cable which takes the current, and this ensures that degree of elasticity required to provide for the safety of the trolleys. Each tractor runs only over its own section of ground. It can draw five boats each laden with 70 tons, at a speed of a little over two and one-half miles an hour. In places where the pathway is too narrow to admit of passing, the tractors simply exchange boats and return on their own road. Otherwise they exchange trolley connection by means of an extremely substantial plug which serves to unite the trolleys with the circuit. The road is in most places level, but at the bridges there is a gradient of 14 per cent. These bridges are extremely low and narrow, allowing only 5 cm. (2 in.) on either side for the boats to pass through. Questioned as to the probability of the copper wires being superseded by aluminum, an experiment that is being tried in France as a consequence of the rise in the price of copper and a fall in aluminum, M. Gérard replied that he did not believe the latter metal would replace the former for electrical purposes from its want of stable resistance.

How rapidly M. Gérard has installed his

Digitized by Google

system will be realized when it is known that it was only on April 7 in last year that the first boiler for the work was delivered at Oisquercq. On October 14 the first boat towed by electricity passed on the water of the Charleroi Canal, and from November 20 to December 9 no less than 740 boats were towed by the new plan along that portion which was then ready. For passing through towns where the river banks are covered with warehouses or other impedimenta, or in going through crowded locks, electric launches are used.

Beside the business of traction, the company finds that as power for towage is only required during the day, it is enabled to supply electricity for lighting purposes to the neighboring villages and communes. This is in great demand, and with the high tension available t even provides light to Roesbroeck, only four miles from Brussels. The lighting current is supplied at a tension of 220 volts by means of special 3-phase transformers. This is paid for at the rate of 55 centimes (about 11 cents) per kilowatt hour for private lighting, and at 30 centimes (under 6 cents) for public use. Driving power for factories from the same company is much employed at Charleroi, and by those factories nearer the Oisquercq station. This is supplied at a reduced tariff of 20 centimes for regular daily work of 12 hours, the current used being a 3-phase of 600 volts; 250 horse power has already been applied for, and 1,300 lamps are now in use.

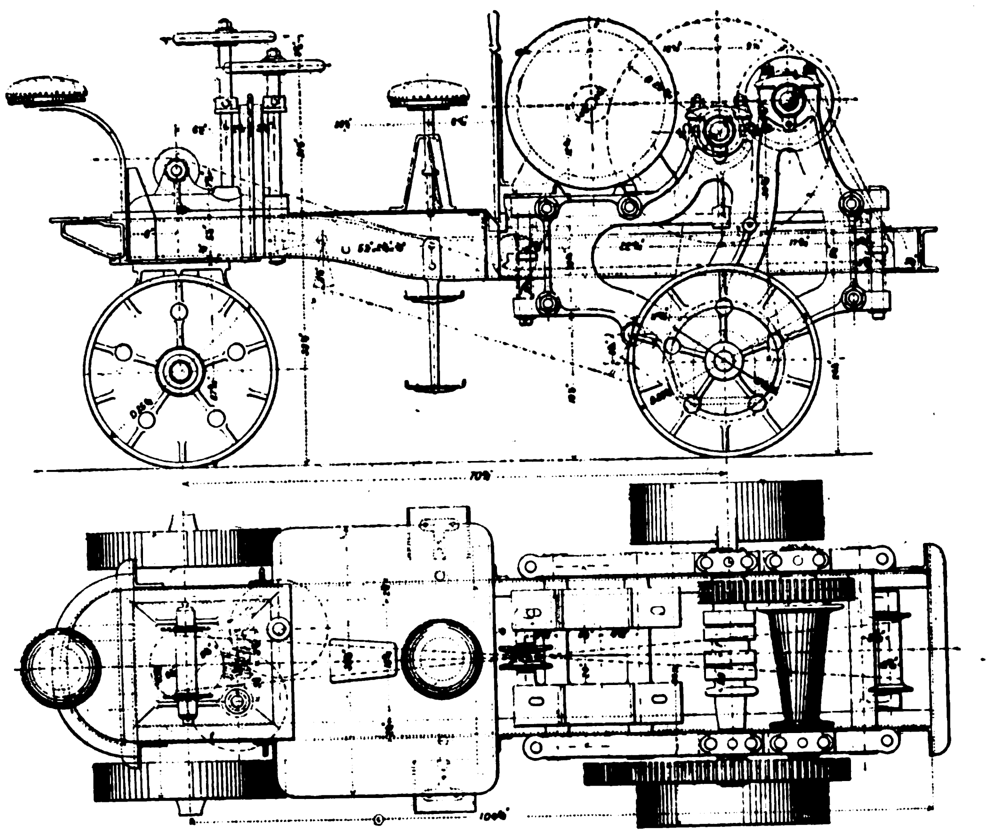

FIG. 5.—SECTION AND PLAN OF TRACTOR USED ON CANALS IN BELGIUM.

At a recent meeting of the Académie des Sciences, M. Henri Becquerel showed that, if on treating a fair quantity of chloride of uranium a very small quantity of barium chloride were put in, the precipitation was richer in active material. The radio activity of sulphate of barium then greatly exceeds that of the commercial uranium chloride. The material in question produced on a photographic plate wrapped in black paper a stronger impression than the uranium.

ELECTRICAL MEASURING INSTRUMENTS.*

BY J. FRANKLIN STEVENS.

In attempting a brief discussion of so broad and comprehensive a subject as that assigned me for this evening, I have been principally concerned in trying to decide just what portion of the general subject I should touch upon and in what manner I could treat that portion briefly, for I cannot hope to be comprehensive, and yet have my remarks present a semblance of coherence.

Since we have available a very extensive literature bearing on the subject of laboratory testing instruments, in which can be found descriptions of the instruments employed, their construction, application and approximate laws, I shall pass over that portion of the subject and confine myself to commercial direct reading indicating instruments, such as are to be found in every-day use.

The history of the art embodied in the commercial manufacture of indicating instruments is extremely interesting, but shows many analogies to the development of other branches of electrical engineering, with the single exception that practical data in published form is extremely scarce. Every one entering this field is compelled to master some of the most intricate problems known to the profession, and must learn for himself how best to apply theoretical deductions to practical mechanical devices. Until very recent years, our sole guide has been the study of early and primitive types which in their time were useful and valuable, but which to day fail to reach the high standard we have learned to demand of an instrument whose function is to indicate the input or output of our many and varied electrical devices. Every new device put before the public has meant a new condition to be met by the instrument manufacturer, requiring of him a new design or modification of an existing design. Two rather recent examples of this occur to me: one, the increasing tendency to employ high voltages in commercial work, reaching frequently 12,000 volts in the case of series constant-current arc light systems and 33,000 volts in long-distance power transmissions; the other, the rapid development of the electric automobile, which requires a volt-ammeter of as high a degree of accuracy as the portable laboratory instrument, yet able to withstand the roughest usage ever accorded an instrument of precision, coupled with restrictive specifications as to size and weight. In every instance instrument manufacturers have met the demands made upon them better, I think, than many of our fellow-workers have in some other lines. Much yet remains to be done, and much, I am confident, will be done in the matter of perfecting existing instruments in the near future. Gradually inefficient or unreliable types are being relegated to oblivion, and the remaining ones brought closer and closer to standard uniform construction.

The greater number of measurements required to-day can be made with a voltmeter, ammeter and wattmeter, and, while it might be thought that the wattmeter is merely a combination of the voltmeter and ammeter mounted in one case, this is not true in all classes of measurement. While it is true that the reading of the wattmeter represents the product of the readings of the voltmeter into the ammeter in the case of direct current measurements, it is not true in the case of alternating current measurements, save in the very exceptional case of a circuit possessing neither capacity nor inductance or a balance of the two. When either inductance or capacity exist there is a consequent lag or lead of the current wave relative to the pressure wave, and, since the instantaneous readings of the volts and amperes represent the mean effective or virtual values, that is, the square root of the mean square, their product differs from the reading of the wattmeter, which indicates the integrated values of two curves, the maximum and minimum values of which occur at different times. To obtain an agreement between the values obtained by volt-ampere readings and watt readings, it is necessary to multiply the volt-ampere readings into the cosine of the angle of lag or lead, so that the ratio of the watt readings, as given by a properly constructed wattmeter, to the volt-ampere readings gives us the power factor of the circuit, and from the two sets of readings we can readily determine the angle of lag or lead and the so-called wattless current. Probably this is well known to all of you, yet scarcely a week passes but I have to explain the matter to one or more customers who cannot reconcile the difference in the two sets of readings and are inclined to believe that some, if not all, of their instruments are indicating erroneously.

Before touching on the different types of indicating instruments which are most commonly found in commercial use, let us consider for a moment the essential requirements of a practical and satisfactory instrument for measuring voltage, current or power. To start with, the instrument must be direct reading. We have no time to-day to convert angular deflections into true values by means of tables of constants, but insist that the pointer shall indicate directly in definite units the value of the passing load or the impressed electromotive force. We must next be assured of the

* Paper read before the Electrical Section of the Franklin Institute, Philadelphia Pa., April 24, 1900.

Digitized by Google

accuracy of the calibration, and for that depend principally upon the reputation of the maker or check the indications by comparison with a secondary standard. Beyond this we must know that the accuracy of the indications is not affected by the influence of ordinary external fields or by normal variations of temperature, due either to heating within the instrument, by means of the passage of the current to be measured, or to variations in the temperature of the room in which they are installed. All instruments should be mounted in dust-proof cases, and the systems carried in jewelled bearings; the movement of the pointer should be aperiodic or dead-beat, and, so far as possible, the system should contain nothing subject to change or deterioration, and should be constructed so that it will withstand successfully the ordinary rough usage liable to be accorded it in practice. The question of gradual change of accuracy, due to the change in some constituent part of the system, has led me to strongly advocate the use of electro-magnetic instruments with gravity control for switchboard use whenever the conditions render them applicable, and I fully expect to see this type of instrument become more popular, as its advantages become more widely appreciated. Such a system is not applicable for portable instruments, save the dynamometer system for alternating currents, and even then a spring control must be used: nor is the series electro-magnetic ammeter practical above about 1,500 amperes, due to the structural difficulties involved in carrying the bus bars directly to the instrument terminals. The one objection most commonly urged against the electro-magnetic instrument for direct current switchboard use is the unequally divided scale, for, as a rule, the scale only covers a range starting at 10 per cent. of the total up to maximum. In most cases, however, this objection is purely captious, for a switchboard voltmeter is seldom used to indicate more than 10 per cent. above or below the normal voltage, and the ammeter indications are of principal importance in the higher ranges to prevent a possible overload of the circuit or generator. In alternating current circuits an equally divided scale is an impossibility, so why should we sacrifice constancy in direct current measurements for the sake of an equally divided scale when the lower registers are so seldom used? In portable direct current instruments the proposition is somewhat different, as we desire to cover the maximum limits of possible measurement on a single scale instrument; therefore, an equally divided scale is desirable and practically necessary.

Taking up now the different types of instruments which are in most common use, we find they may be roughly divided into six classes, depending on the principle by means of which measurements of voltage, current or power are made: (1) the hot-wire; (2) the tangent galvanometer; (3) the electro-static; (4) the dynamometer; (5) the D'Arsonval galvanometer and (6) the electro-magnetic.

The hot-wire instrument is designed to operate by the expansion of a fine wire or strip of conducting material due to the heating produced by the passage of the current to be measured, and, therefore, the indications are proportionate to the square of the current. This type of instrument possesses the advantage of indicating with equal accuracy the current flow on either direct or alternating current circuits and is independent of the frequency of the circuit or of the shape of the current wave; it is, further, unaffected by the presence of external fields. These advantages, however, are all that can be claimed for this system, and to offset them are many serious disadvantages. Since the instrument operates by virtue of temperature differences, it is extremely susceptible to variations of external temperature, and such variations must be compensated either by mechanical means, which provide for bringing the pointer to zero by increasing or decreasing the tension on the working wire, or by providing auxiliary heating strips which are supposed to automatically adjust the tension of the working wire on the general principles of a thermostat. This may seem a small matter to most observers, but to me it signifies an error in principle, and reminds me of one of our early types of arc dynamos which, by reason of incorrect construction, was found to spark badly; so, in place of correcting the design, an air blast was provided to blow out the spark. Another point of objection is the constant change of zero, due to the fact that until the wire has been stretched to its elastic limit it will fail to return to the same point after having been stretched by the heat applied, and will always show a slight residual strain. To attempt to correct this prior to installation in the instrument means, judging by my own experience, that at least 90 per cent. of the wires will break during the preliminary stretching process, and the remaining 10 per cent. will stand but a very slight overload in service. As overloads are quite common, this would constitute a serious objection, for it means the return of the instrument to the manufacturer for the insertion of a new wire and recalibration. Another very serious objection is the amount of current required to operate the instrument. The average resistance of a modern hot-wire voltmeter is 4 ohms per volt, which means a current flow of .25 ampere. This low resistance effectually bars this type of instrument for accurate testing, since the amount of power abstracted from the circuit to be tested vitiates the accuracy of the results obtained and introduces serious errors, which must be allowed for in all calculations. Recently an attempt has been made to introduce the hot-wire instrument as a shunt ammeter, particularly for alternating current measurements. As a shunt ammeter, the hot-wire instrument is a distinct failure, for, while the manufacturers claim it can be operated on a drop of .3 volt for full scale, my personal experience has shown a drop of 6 volts to be necessary. On the makers' figures, 300 watts would be required to operate a 1,000 ampere ammeter, nearly .4 horse-power per instrument, while on the sample I have tested 6,000 watts, or 8 horse-power, would be required. Again, it has been shown that these ammeters when calibrated on direct current are not accurate within 10 per cent. when used on alternating currents, unless the reactance in the shunt is exactly equal to the reactance in the instrument, a condition almost impossible to obtain, even with the most careful design.

A modification of the hot-wire system has been proposed, consisting of an enclosed chamber containing a fixed resistance wire, one end of the chamber, which is made air-tight, consisting of a flexible diaphragm operating the pointer through a system of levers. In this case, the heat supplied to the wire by the passing current causes the air in the enclosed cylinder to expand and, consequently, puts the diaphragm under tension, very much on the principle employed in the aneroid barometer. I find by actual experiment that such a system could be applied to voltmeters, and could be so made that it would be accurate in its indications and would possess a reasonably high resistance. The feature, however, which renders this system impracticable is the slowness with which the readings can be taken. The pointer will not come to rest until after the heat supplied the air enclosed within the chamber is equal to the heat radiated by the walls of the enclosing chamber, and from one and a half to two minutes are required before the pointer will come finally to rest at the part of the scale marked to indicate the impressed E.M.F. This is true no matter how small the air chamber is made; and while it is possible to shorten this time by carefully covering the sides and one end of the cylinder by a heat insulating jacket, still it cannot be constructed so as to give an instantaneous reading, and every attempt to shorten the time by covering the walls of the chamber results in a corresponding increase of the time required for the pointer to come back to zero after current has been shut off. In other words, the instrument is similar in its action to an ordinary thermometer, which, as you know, cannot be made to respond instantly to changes of temperature.

Electro-static instruments, which depend for their action on the mutual attraction of two plates connected to the opposite sides of the line, are still used, but not extensively, for high tension measurements. They will indicate correctly on either direct or alternating current circuits, but are limited to measurement of voltage. It is impossible with this type of instrument to obtain a low reading, as the attraction of the plates toward one another varies approximately with the square of the potential difference between them. I say "varies approximately" advisedly, as the capacity of two plates varies directly with the square of the voltage only when the distance between the plates is maintained constant, which in this case is an obvious impossibility. As a rule, these instruments cannot be made dead-beat without introducing elements liable to seriously interfere with their accuracy; and, while there are no errors due to temperature changes, and while they are also extremely efficient, requiring no current flow at all, they are affected very considerably by external influences, particularly by static charges, which are almost invariably present in power stations or dynamo rooms, and, as you probably know, it is practically impossible to provide a shield for static effects.

Instruments employing the principle of the tangent galvanometer are still employed, and for certain classes of measurements are extremely useful. They can be particularly recommended for use as ground detectors or differential voltmeters, where the actual value of the indicators is of small moment, the particular object being to show a balance of two opposing voltages or the presence of a ground by deflection. In this system the magnetized needle is suspended vertically, and is acted upon by two equally and oppositely wound solenoids; that is, the solenoids are wound with two wires in multiple and then cross-connected, so that we have two circuits equal in effect but opposite in action. I might say in passing, that if the proper proportions of solenoids to magnetized needle are employed, and the length of the magnetized needle properly proportioned to its area, the tangent gal-

Digitized by Google

vanometer instrument may be made extremely accurate and also quite permanent. Care must be taken, however, that under no conditions can the direction of the lines generated by the solenoids oppose the lines existing in the magnetized needle, otherwise the value of the calibration is almost instantly destroyed.

For measurements of alternating current voltage, and also for the measurement of the watt output of any alternating current source of energy, the dynamometer system, in one of its many modifications, is unquestionably the best type of instrument that can be used. This instrument indicates directly the mean effective voltage of the line to which it is connected, and is equally accurate for direct current measurements, provided readings are taken with the direct current flowing through the instrument in one direction, then the direction of the current flow reversed and a second reading taken, the mean of the two readings being the correct value of the impressed electro-motive force. This for the reason that the instrument is extremely susceptible to the influence of external fields. Further, the dynamometer type of instrument is only properly adapted for use in portable instruments. The fact that two readings are necessary on direct current prohibits its use as a switchboard instrument on direct current circuits, and its delicacy, coupled with its field of low intensity and its susceptibility to error, due to the presence of iron in its immediate neighborhood, whether used on direct or alternating current circuits, renders it impracticable as a switchboard instrument for alternating current circuits. As an ammeter, it cannot be successfully employed for measurements above .5 ampere, due to the difficulty of providing perfectly flexible contacts capable of carrying large currents. When you attempt to convey a current into a moving coil beyond the carrying capacity of a flexible conducting spring, recourse must be had to mercury contacts, and a mercury contact should never be employed in a portable or enclosed type instrument. In the dynamometer instrument great care must be taken to have the moving coil as light as possible; and to render the instrument aperiodic, or dead-beat, an aluminum air-vane, moving in a partially enclosed chamber, must be employed. Manually operated brakes acting on the delicate moving system should be avoided, as their continued use results in a serious derangement of the moving parts.

Instruments based on the principle of the D'Arsonval galvanometer are very extensively used to-day for both switchboard and portable instruments on direct current circuits; they can be calibrated so as to show an equally divided scale, and, if properly constructed, are an extremely efficient instrument. Further, they are very well adapted to the measurement of resistances and grounds. In the construction of this type of instrument the important factor is the permanency of the permanent magnet fields employed. It is essential in the first place, that the proper grade and quality of steel shall be employed, which means a steel possessing high permeability and a high degree of retentivity; then this steel must be carefully worked within definite limiting temperatures and must be treated with great care and skill in the process of magnetizing and aging. Further than this, the moving coil should be extremely light and the whole system carefully shielded from the influence of external fields, and yet so shielded that the moving coil will not be robbed of an appreciable number of lines of force, due to the presence of the shielding iron. The greatest field for this type of instrument is in the measurement of heavy currents; that is, for currents of 1,000 amperes and upwards, due to the fact that it can be operated as a shunt instrument, requiring an extremely small drop of potential, full scale being obtained with a drop of from .03 to .05 volt. This means a relatively high efficiency, and, while the instrument does not possess all of the advantages of a series ammeter, yet it is far easier to install, and, where a high degree of accuracy in current indications is not demanded, will be found very satisfactory in practice.

Further than this, the D'Arsonval instrument, which gives deflections directly proportionate to the current flow, lends itself readily to a large variety of measurements, such as determining resistances and measuring the drop of potential from which resistances and grounds may be readily computed. It is, however, a type of instrument which should be handled with great care, as rough handling or the presence of powerful external fields will permanently destroy the accuracy of its indications. Further, since it depends primarily for its continued accuracy of the maintenance of a field of uniform strength, as supplied by its permanent magnet field, instruments of this type should be frequently checked to ascertain whether the permanent magnets have maintained their initial strength.

A great deal might be said on the subject of the last type under consideration, namely, the electro-magnetic system, for there are probably more variations in practical construction contained in this type than in all the other types put together; some are good, many very bad. It is, however, unfair to adopt the policy of certain engineers, who unqualifiedly condemn every electro-magnetic instrument, solely and entirely on the grounds that they contain a moving mass of iron, which, in their opinion, must render the instrument subject to errors of lag and hysteresis. My practical experience with this type of instrument, covering a great many years, has taught me that it is perfectly possible to so construct an electro-magnetic instrument containing a mass of moving iron that errors of lag and hysteresis, if they are present, are so small as to be negligible. In order to achieve this result it is necessary first to proportion every part of the instrument with reference to all other parts; to carefully shield the instrument from the influence of external fields, and this by means of a shield that will not introduce errors due to its own retentivity. The iron employed should be very small and very light, and should be selected after careful test for purity and absence of retentivity. It should then be formed up with care, and so treated that oxidation is practically impossible. The field due to the actuating solenoid should likewise be carefully studied, and should be designed so that the moving iron will at no time be completely saturated, and yet of sufficient strength, in conjunction with the shield employed, as not to permit the indications of the instrument to be seriously influenced by external fields. In no case should two masses of iron be employed, as is common in some types of instruments, which depend on the repulsion of a moving vane by a fixed vane of similar polarity, both being energized by the actuating solenoid. It is almost impossible to free double vane instruments from errors of lag or hysteresis, and there is a further tendency for the pointer to stand off zero, due to the residual magnetism mutually induced in the two vanes.

The fact that the instruments constructed on the electro-magnetic principle contain no material subject to change or deterioration, coupled with the fact that they can be built solidly and substantially, and controlled by gravity in place of a spring or springs, renders them exceedingly reliable in practice. If their calibration is correct when first installed, there is no reason why the calibration should change with time.

In the above brief description of the most common types of indicating instruments, it may be noted that there is no one type which is universal, that is adapted for both switchboard and portable use for either direct or alternating current measurements. While we can very readily dispense with the hot-wire and electro-static instruments, the other four types are essential for some class of measurement, and for any particular line of measurement the most suitable system should be selected. It is possible that some day a universal system may be found, but until that time, the user must select from existing types the one which in principle seems most applicable, not only to the character of electrical energy to be measured, but also to the conditions under which measurement must be made.

(To be continued.)

PRACTICAL VS THEORETICAL.

(From the "Mechanical World," London).

What do we understand by the term "practical" man, and what are the characteristics indicative of the "theoretical" man? There need hardly be an apology for interrogating in this strain when reading some comments which have just appeared in an American electrical journal under the heading "Practical versus Theoretical." The writer, a Mr. D. F. Comstock, has been impressed more and more of late with the set-back given to the teaching of modern science by the indiscriminate use which is made of the terms "theoretical" and "practical." He cites the case of a professor —presumably an American—at a school of science, whose delight it was to emphasize to students the vast difference between the two results he was endeavoring to attain, with the consequence that there seemed to grow in the minds of the most susceptible a notion of two distinct phases of science, one of which agreed with everyday life, the other being some remote hypothetical study whose only value was a distinct resemblance to fact in points at long intervals. It is not uncommon to discover erroneous ideas as to the relative values of theoretical and practical experience and qualifications.

We are afraid that many a man who is looked upon as a practical engineer or scientist is deficient of much of the knowledge requisite to justify that appellation. Too often in the eyes of commercial men, in whose power it lies to mete out recognition, the man who wears overalls and potters about blusteringly among much machinery is regarded as a useful, practical man, while the young theorist with spectacles with a studious, absent-minded look, however great may be his real qualifications, is thought to be unfitted for a certain position because he has pursued his studies more deeply than another. As Mr. Comstock remarks, some time ago this notion seemed to pervade the minds of some leading American business men, who

Digitized by Google

prized the unlearned but so-called practical machinist far more than the college graduate who was thought to be full of nothing but book. Happily there it is becoming realized that the theoretical is but a study of the practical, and that the practical man is often enough of little use at theory except in so far as he builds under competent supervision the parts which the carefully-evolved theories of his more studious confrères have made possible.

There are theorists who are far from showing any aptitude for practical work, as there are myriads of practical men who are sadly deficient as theorists. We are indebted to some modern dictionaries for the information that "theoretical" means "not practical," but happily there always have been in the world of engineering science men to whom it has been given to combine the two attributes. These have been the men who have risen from small things to become leaders—have by their industry done so much to maintain the supremacy of British engineering. One has not to seek far for proof that we fail to appreciate the theoretical man at anything like his real worth. More than one true worker has been lost to us because his sterling qualities have been better valued and rewarded across the Atlantic. Our losses have been America's gain, though science herself may not have been the loser by the transaction. Our niggardliness in this respect has left a serious defect in our national armor at which our rivals have not failed to direct their aim. Americans have found here countless opportunities to deride us on account of the scanty bread-and-butter pittance with which many of our men of knowledge and learning have to rest contented.

Theoretical knowledge alone is by no means at a premium over here; and the reason why the demand is so limited is because of a misconception of its worth. In more or less remote connection with this topic is the criticism which has recently been offered upon English engineering firms and their method of engaging travelers and representatives minus technical knowledge to act on their behalf. It is asserted that our transatlantic rivals go one better in this respect. They are not satisfied with a representative who knows merely the names of machines and their many parts—who knows the difference between a locomotive and a dynamo, but little more. In many cases they engage a thoroughly practical engineer—one who has passed through the schools and served his time in the shops. And is it not reasonable to suppose that such qualities, coupled with enterprise and commercial ability, or, in a word, "push," will bring about the best results from whichever standpoint we view the matter?

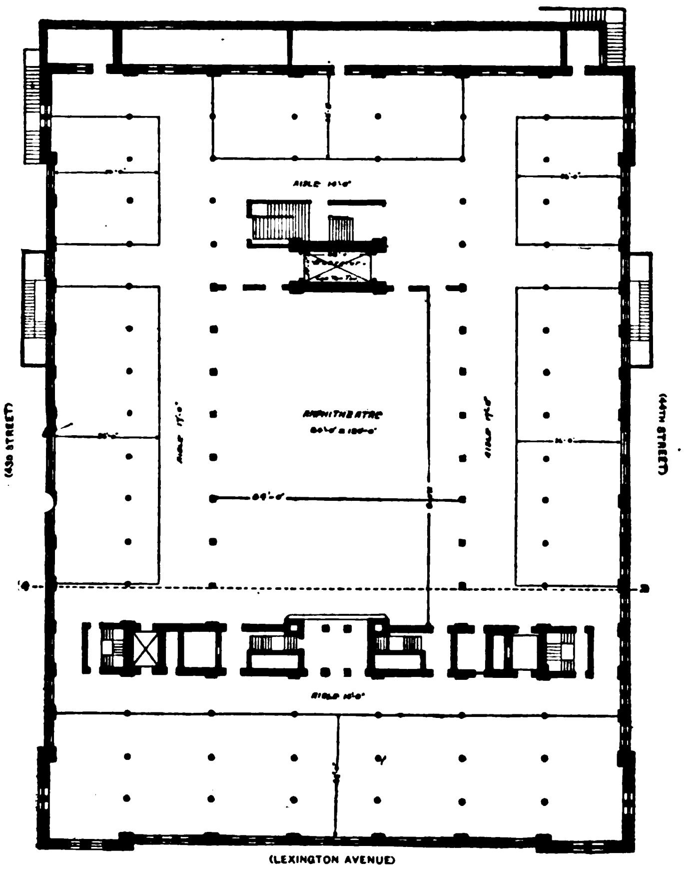
An Electrical Sweeper.

The Budapest Tramway Company of Budapest, Hungary, had in use last winter, according to the London "Electrical Engineer," an electric sweeping car for clearing its lines of snow. The apparatus chiefly consisted of an ordinary tramcar frame, under which, both back and front, were placed cylindrical brushes. The brushes were put in motion by a 20 kw. series motor and were made to revolve rapidly. The total weight of the car was 12.5 tons, and it ran at a speed of from 5 to 7½ miles per hour. The cylindrical brushes were of the same width as the track and had a diameter of 3 ft. 7 in. They were combined with four other brushes, made to move backwards and forwards, and specially arranged to clear dirt and snow from the metals themselves.

THE AUTOMOBILE EXHIBITION.

The early applications for space indicate that manufacturers are taking a keen interest in the automobile show to be held in the Grand Central Palace, New York City, from November 14 to 24. More than 10,000 feet of space has been signed up, and this, with the spaces selected but not yet signed for, will make fully half the available space disposed of almost four months before the exhibition.

In location, space and arrangement the Palace has many good points, while the fact that the automobile show will be open during the horse show week is counted a distinct advantage. The latter has grown to be so important a feature that an average of 50,000 people come from out of town to attend each year. The automobile show will appeal strongly to precisely this following, so that these 50,000 out-of-town visitors are not likely to return to their homes without attending the automobile show. The horse show as heretofore will be for one week only, the last six days of the automobile show, which will be open in all ten days.



Mr. Marcus Nathan, the general manager of the automobile show, is doing much to stir up an interest that will extend far beyond the present users of automobiles, a fact that should and no doubt will mean much to exhibitors. In addition to extensive and judicial advertising in the newspapers and by posters, an elaborate plan of circularizing is under way, so that practically everybody with money enough to own an automobile will be reached.

The representative character of the exhibits and their variety and completeness are factors in creating a popular interest. With this in mind the management made very low prices, abolished most of the usual extra charges and made all of the conditions easy. The result is already apparent in the large advance sale of space to representative concerns.

LONDON NOTES.

[From our London Correspondent.]

The Pacific Cable Scheme.

At last, after unconscionable delays, consequent in part upon the strenuous opposition of the existing cable monopolists, and in part upon the almost endless negotiations which have had to be conducted between the home Government and the interested colonies, the Pacific cable scheme has been laid open to tender. The announcement is that tenders are invited "by the Pacific Cable Committee on behalf of Her Majesty's Government and the Governments of Canada, New South Wales, Victoria, New Zealand and Queensland for the manufacture and laying of 8,272 nautical miles of telegraph cable in the Pacific Ocean, between Vancouver and Fanning Island, Fanning Island and Fiji, Fiji and Norfolk Island, Norfolk Island and New Zealand, Norfolk Island and Queensland." It is proposed that the undertaking shall be divided under three distinct contracts, for any one or more of which contractors may tender. The contractor will have to guarantee the good electrical condition and working order of the cables for thirty consecutive days after the completion of the laying. A fourth contract is also proposed for surveying and sounding the whole route before the cables are laid. Tenders have to be lodged with Messrs. Clark, Forde & Taylor, 4 Great Winchester street, London, E. C., on Tuesday, August 14. Although this matter has now reached the tendering stage, this is no warranty for saying that the scheme will, even now, be carried through. The present cost of the cable, etc., will be enormously higher than when the scheme was first set on foot, when the cost was put at between one and a half and two million pounds. It is quite certain that the bidders will be few in number, for there are not many who can undertake work

Digitized by Google

of the kind. The Telegraph Construction & Maintenance Company, the India Rubber, Gutta Percha & Telegraph Works, W. T. Henley's Telegraph Works Company, Siemens Bros. & Company at any rate will be in evidence. But the suspicion, to which expression has lately been given, is that the cost will now be so great that the colonies may not be prepared to run to a greater amount than was originally anticipated. Further negotiations and other delays may even then follow, and with a dissolution of Parliament, likely to fall at any moment, the matter would appear to have some uncertainty. Cable manufacturers have been looking for these contracts with eagerness for some years.

Refuse Destructors and Electric Lighting.

The official opening of a municipal electric light and refuse destructor plant took place July 18 at Gloucester. A similar combination started at Darwen, in Lancashire, a few months ago is reported as giving very satisfactory results, and electric tramways are to be added. The Hackney (London) Vestry, whose district borders on to the memorable Shoreditch (where coal furnished such an admirable form of *refuse* once upon a time!) are proceeding with a combined scheme of considerable magnitude. The consultant acting for Gloucester and Hackney is Mr. Robert Hammond.

New Trolley Lines.

Within the past few weeks new electric trolley lines have been opened at the following places: Aberdeen (first section), owned by municipality; Southampton (first section of an extensive system) owned by municipality; Swansea (company). A twenty mile system is ready to commence running, being owned by the Norwich Electric Tramways Company. Although a cathedral city Norwich has had no tramways until now. At Dundee and Southport municipal lines are being opened. At Liverpool new sections are being started nearly every week. To give details of the equipments in each place is not necessary. They are all trolley lines and there are no particularly striking features.

Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended July 28:

Antwerp, 89 packages, $8,023; Australia, 5 cases electric motors, $777; 11 packages, $183; Bradford, 1 case, $34; Branderburg, 3 packages motor parts, $75; Brazil, 15 cases $829; 18 packages, $1,896; 18 cases motors and parts, $1,790; Berlin, 5 packages, $635; 1 case, $15; British Guiana, 18 packages, $5,339; British West Indies, 18 packages, $351; Central America, 5 packages, $69; China, 5 packages, $129; Cuba, 50 packages, $520; Dublin, 71 reels electric cable, $25,685; Dutch East Indies, 2 cases, $162; Genoa, 12 cases, $186; Glasgow, 72 reels electric cable, $29,039; 2 cases $125; Hamburg, 28 packages, $6,689; Havre, 192 packages, $12,802; 8 cases, $373; 3 cases electric instruments, $304; 8 cases automobile material, $500; 7 packages, motor material, $74; Hong Kong, 17 packages, $660; Japan, 98 cases, $4,595; Leith, 2 cases, $421; Liverpool, 60 packages, $11,613; 29 packages motors, $1,160; London, 165 packages, $14,420; 2 cases, $138; 63 reels electric cable, $13,932; 3 motors, $490; Manchester, 55 packages motors, $2,500; 7 cases, $541; Mariupol, 98 cases, $7,673; Mexico, 49 packages, $1,352; Naples, 39 cases, $7,899; Newcastle, 28 packages, $4,600; Peru, 10 cases, $496; Riga, 13 cases, $1,204; Rotterdam, 1 case, $10; Siam, 18 packages, $705; Southampton, 165 packages, $2,692; St. Petersburg, 81 packages, $6,415; U. S. Colombia, 106 packages, $3,450; Vladivostok, 11 boxes, $3,240; Zurich, 2 packages, $100.

PERSONAL MENTION.

Mr. Frank C. Wright, manager of the Dover (N. J.) Electric Light Company, has tendered his resignation to take effect October 1. Mr. Wright will go to Cuba as an electrical engineer for a syndicate under a three year contract in railroad and electric light construction.

Prof. Eleazer Darrow, of Spokane, director of the Washington State College, is in Pittsburg, Pa., studying electricity and its uses at the Westinghouse and other plants.

Mr. James Rush, who was formerly employed at the electric light plant at Bloomsburg, Pa., for several years, recently assumed charge of the power house of the Squier Electric Light Company of Williamsport, Pa.

Mr. J. A. Trawick, late of Boston, Mass., was recently appointed general manager of the Little Rock (Ark.) Traction & Electric Company.

Mr. E. A. Smith, formerly superintendent of telegraph on the Fitchburg Railroad, was lately appointed assistant superintendent of the Fitchburg division of the Boston and Maine road with jurisdiction of lines east of East Deerfield, Mass.

Mr. P. Bruno Kohler, Under Secretary of the Department of Foreign Affairs of the German Postoffice, arrived in New York on Friday from Bremen. His mission is to look after the interests of the German postal service in the laying of the new German cable from Coney Island to the Azores.

INCORPORATIONS.

The Dayton Electric Light & Power Company, Dayton, Ky. Capital stock, $50,000. Directors: H. M. Stegman and others.

The Granite State Electrical Works, Lisbon, N. H. Capital stock, $25,000. Incorporators: H. C. Libbey, H. H. Atwood, C. J. Currier, J. W. Richardson and W. Williams, all of Lisbon.

The Cattaraugus Electric Light & Power Company, New Albion, N. Y. Capital stock, $12,000. Directors: A. J. Setter of Collins Center, Frank Crawford and H. P. Bishop of Cattaraugus.

The Mt. Lassen Power Company, San Francisco, Cal.—to generate and dispose of electricity, etc. Capital stock, $1,000,000. Directors: A. Hochheimer of Willows, C. L. Morrill, F. Smith, A. F. Johns of San Francisco, R. M. Saeltzer and H. L. Shannon of Redding, and Park Henshaw of Chico.

The Genesee Electric Company, Rochester, N. Y.—to supply electricity for light, heat and power in Rochester. Capital stock, $50,000. Directors: P. H Flynn, Fred C. Cocheu of Brooklyn, and William A. Boland of New York City.

The Bath Electric & Gaslight Company, Bath, N. Y. Capital stock, $100,000. Directors: N. W. Dalton, M. A. Dalton and J. F. Parkhurst, all of Bath.

The Herkimer Construction & Improvement Company, New York City—to construct and equip railroads and telegraph and public works. Capital stock, $10,000. Incorporators: Robert Earl, Herkimer; Louis W. Stolesbury and Thomas E. O'Shea, New York City.

The Reuterdahl Electric Company, Saco, Me.—to make and deal in dynamos, storage batteries and generators of electricity. Capital stock, $100,000. President, Arvid Reuterdahl; treasurer, George F. Weston, both of Providence, R. I.

The New York & Queens Electric Light & Power Company, Albany, N. Y.—to operate in the Borough of Queens and in Nassau County. Capital stock, $2,500,000. Directors: Henry R. Wilson of New York City, Thomas W. Stephens and H. L. Snyder of Montclair, N. J.

The Ideal Electric Contracting Company, New York City. Capital stock, $1,000. Directors: Henry Nekritz, William E. McKeen and Adolf Hirschfield, all of New York City.

The Springfield Water & Electric Light Company, Springfield, Ky. Incorporators: J. H. Thurman and W. C. McChord.

The Washtenaw Electric Company, Ann Arbor, Mich.—to supply towns, cities and villages and their inhabitants with electricity for lighting, heating and motive power. The operations of the corporation are to be carried on at Ann Arbor and Ypsilanti. Capital stock, $50,000. Stockholders: Bernard Rorison, A. C. Rorison, William J. Clarke, P. M Miller, W. H. Sweet, C. L. Stevens, Robert Hemphill, Jr., A. Beyer, Robert W. Hemphill, Clark Cornwell, H. P. Glover and R. W. Hemphill, Jr.

ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U. S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

LETTERS PATENT ISSUED JULY 24, 1900.

ELECTRIC RAILWAYS AND APPLIANCES.

654,325. Automatic Switch for Electric Car-lighting Apparatus. Willard F. Richards, Buffalo, N. Y., assignor to Charles M. Gould, New York City. Filed March 12, 1900.

654,348. Trolley-Harp. Edward G. Johnson, Brigantine, N. J., assignor to the Edison-Johnson Electrical Manufacturing Company of New York. Filed Feb. 16, 1900.

654,448. Trolley-Base. Henry S. Goughnour, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Sept. 23, 1899.

654,574. Trolley-Track for Electric Railways. Victor Koch, Scranton, Pa. Filed Feb. 24, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

654,207. Incandescent Lamp. Samuel D. Washburn, Boston, and Clarence H. Tinkham, Cambridge, Mass. Filed June 25, 1898.

654,208. Incandescent Electric Lamp. Samuel D. Washburn, Boston, and Clarence H. Tinkham, Cambridge, Mass. Filed Jan. 23, 1899.

654,277. Electric-Arc Lamp. Henri Pieper, Fils, Liege, Belgium. Filed Dec. 28, 1897.

654,433. Incandescent Lamp Socket. William B. Bragdon, Cumberland Mills, Me., assignor to S. D. Warren & Co., Boston, Mass. Filed Oct. 31, 1899.

ELECTRICAL MACHINERY AND APPARATUS.

654,239. Electric Switch. William Ely, Providence, R. I. Filed May 24, 1897.

654,299. Starting Mechanism for Alternating Current Motors. James J. Wood, Fort Wayne, Ind. Filed March 30, 1900.

654,410. Apparatus for Controlling Electric Motors. Frank A. Merrick and Emmett W. Stull, Johnstown, Pa., assignors to the Lorain Steel Company of Pennsylvania. Filed Nov. 22, 1899.

654,551. Means for Regulating Electric Motors. Robert Lundell, New York City. Filed May 19, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

654,326. Voice-Concealing Attachment for Telephones. Henry P. Roberts, Boston, Mass., assignor to Everett D. Godfrey, Taunton, Mass. Filed Jan. 15, 1900.

MISCELLANEOUS.

654,130. Electric Steering Gear. Harold W. Buck, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed March 20, 1899.

654,138. Electric-Current Grounding Device for Fire-Extinguishing Apparatus. William A. Dennett, Springfield, Mass. Filed March 14, 1900

654,187. Electrical Safety-Fuse. Arthur L. Stevens, New York City, assignor to the Pennsylvania Manufacturing, Light & Power Company of New Jersey. Filed Aug. 16, 1899.

654,310. Junction or Connection Box. Rudolf Hundhausen, Wilmersdorf, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Nov. 18, 1899.

654,317. Graphophone. Thomas H. Macdonald, Bridgeport, Conn., assignor to the American Graphophone Company, Washington, D. C. Filed Oct. 13, 1896.

654,320. Electric Heater. Robert R. Morison, San Francisco, Cal. Filed Nov. 15, 1899.

654,341. Damping Device for Recording Instruments. William H. Bristol, Hoboken, N. J., and Franklin B. Bristol, Naugatuck, Conn., assignors to the Bristol Company, Waterbury, Conn., and New York City. Filed May 24, 1900.

654,355. Electric Gas-Lighter. John Y. Parke, Philadelphia, Pa. Filed May 9, 1899.

654,367. System of Distribution. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Original application filed Sept. 10, 1897. Divided and this application filed May 18, 1899.

654,390. Induction-Coil. Reginald A. Fessenden, Allegheny, Pa. Filed Dec. 1, 1899.

654,463. Electric Furnace. Henri Lebleux, Paris, France, assignor to La Compagnie Electrometallurgique des Procedes Gin & Leleux, same place. Filed July 7, 1899.

654,493. Attachment for Phonographs. Horace Sheble, Philadelphia, Pa. Filed Dec. 11, 1899.

654,498. Electric-Metering System. Frederic E. Town, Glencarlyn, Va. Filed May 11, 1900.

654,519-654,520. Secondary Battery. Clyde J. Coleman, Chicago, Ill., assignor to Thomas J. Ryan, New York City. Filed Oct. 2, 1899.

654,531. Electric Bell. Charles H. Furgason, Binghamton, N. Y., assignor of one-half to Eric Peterson, same place. Filed Oct. 2, 1899.

654,557. Secondary Battery. Donato Tommasi, Paris, France. Filed July 8, 1899.

DESIGN.

32,953. Frame for Telephone Calls. Joseph A. Williams, Cleveland, O., assignor to the Williams Electric Company, same place. Filed Aug. 21, 1899. Term of patent 7 years.

Digitized by Google

THE TELEPHONE WORLD.

The new switchboard of the Chicago Telephone Company's Washington street exchange, which it has taken a year to install, has recently been completed. The switchboard occupies the entire eighth floor of the building out of range of the sounds from the streets below, and out of reach of most of their dust. The new switchroom is lighted from overhead, so that in fair weather the operators will have abundant illumination from the sun's rays. The switchboard extends around the four sides of the room, encased in mahogany cabinets, along which the operators are to sit. The system of signals and connections will be much simpler than that of the old board, and yet it is complicated enough because of new possibilities in the way of making connections, to be a complete puzzle to one who is not familiar with it. A few statistics showing the amount of detail involved in setting up the new board follow:

Number of wires entering building	21,600
Number of wires to switchboard	18,000
Number of spring jacks on board	194,460
Number of relays on board	7,910
Number of lamps on board	7,447
Number of soldered wire terminals in multiple jacks	1,161,400
Number of miles of wire in board	12,000
Soldered connections in board	2,000,000

The Automatic Telephone Company of Springfield, Mass., wants a long distance connection with the Massachusetts Telephone Company, which was recently granted permission to put its line through Springfield. The long-distance line is being built from Boston to New York and points west, and the workmen are now busily engaged stretching the wires near Worcester. By the terms of the franchise given the company by the Springfield city council, the company cannot establish a local business. On the other hand, the weakness of the case of the Automatic Company was in the fact that it could not offer its subscribers, a long distance connection to compete with the rival New England Company. It was natural, therefore, that the Automatic Company should look to the Massachusetts Company to furnish the deficiency in its service. This was pointed out at the time the Massachusetts Company was granted the local franchise. No definite step toward an agreement between the companies had then been taken, but now it is said that the Automatic Company has approached the other corporation with this proposition. No answer has been given, but those who pretend to understand the situation say that there is little doubt that the Massachusetts Company will make the arrangement desired. This will mean that the subscribers of the Automatic Company will be given approximately the service with the large cities that the subscribers of the New England Company are now getting. If this is accomplished, it will be a victory for the Automatic Company.

The telephone company in San Francisco, Cal., must pay a separate tax for the nickel-in-the-slot attachment to its telephones. That is the effect of a decision rendered on demurrer by Police Judge Fritz in the cases of President John I. Sabin and Secretary Fred W. Eaton of the Pacific Telephone & Telegraph Company. The corporation, through its representatives, were accused of having failed to pay both the regular license on telephones and the license on nickel-in-the-slot devices, and of having failed to furnish the tax collector with a list of its subscribers. It was urged as a defence by the telephone company that the imposition of a tax of 50 cents a quarter on each telephone repealed that part of the nickel-in-the slot machine ordinance relating to telephones. This was the main point in the demurrer filed by the defendants. As to this contention the decision says: "The court is of the opinion that a nickel-in-the-slot attachment is not necessarily a part of a telephone instrument, and there may be a tax imposed on an instrument and also on any attachment that may be placed upon it."

The local anti-Bell Telephone Company in Duluth, Minn. expects to announce in a month or so the completion of arrangements for toll lines connecting Duluth with all the surrounding iron, mining, and lumbering villages of the district. The company received its franchise 17 months ago, and has in full operation an exchange of 1,300 subscribers in Duluth and 600 in Superior, the two systems being connected. The company claims that it has 60 per cent. more 'phones in use in Duluth than the Bell Company.

According to news received from St. Louis, Mo., City Counselor Schnurmacher has recently notified the Kinloch Telephone Company that unless the company files statements of its earnings and pays 5 per cent. thereon to the city, that its license to occupy the streets with conduits will be revoked. The general ordinance applying to wire-using companies makes this a condition of the Kinloch contract, and in accepting its provisions, the company filed a $20,000 bond with the Mississippi Valley Trust Company as surety. The reports of half yearly earnings should be made on the first day of January and the first day of July. Although the attorneys of the Kinloch Company have informed Mr. Schnurmacher that they will give his letter their attention it is said that the claim will be made that the company pays all its taxes as other corporations do, and to pay this extra 5 per cent. is equivalent to paying an income tax. They maintain that an income tax has been held to be unconstitutional. If this contention it adhered to the City Counselor will file suit against the company or its sureties.

Two young inventors of Chicago are arranging to give a public exhibition this week of a device for communicating with besieged towns in war times by means of telephones carried by box kites. They are Edward E. Harbert, electrician, 1007 West Van Buren street, and Raymond L. Anglemine, 281 South Paulina street. The kites used by the experimenters are box kites of the Eddy pattern, each 18 feet long, 2 feet wide and 1 foot high. Two kites fastened together are used, and when the distance which they are to travel is great three or more sets of tandem kites are employed. Attached to the kite line, about 100 feet below, is a pulley through which runs a lightweight double conductor flexible wire of aluminum. Attached to the end of this wire, swinging free from the pulley is a telephone, and another telephone is ready for operation where the kite flyers have their position. The kite is sent up until directly over the place with which communication is desired. Then the telephone swinging below the kite is lowered by playing out the circuit wire and letting it slip through the pulley, drawn by the weight of the instrument, until the people beneath secure possession of it and are put in communication with the kite flyers. The kite flyers are enabled to tell when their telephone is directly over a given point by means of a stademeter. The inventors say that by means of the box kites they can effect communication with a place ten miles away when the wind is right, although the ground between may be held by a hostile force.

Harry B. Gates of Indianapolis, Ind., appeared recently before the State Board of Tax Commissioners, representing the New Telephone Company of Indianapolis, of which he is secretary, and submitted a statement as to the valuation of its property. The statement of the company to the State board shows its capital stock is $400,000, divided into 8,560 shares. It has 1,430 residence and 1,830 business 'phones. Its gross earnings from the time it began business—July 1, 1899—to April 1, 1900, are reported to have been $59,152.96. The net earnings are not given. It has telephone lines in the following townships in Marion County: Center, Warren, Decatur, Perry, Pike, Washington and Wayne. It reports 134.47 miles of wire in Center township, in which the city is located. The statement also showed value of stock to be $356,000; mortgages, $500,000; real estate, $24,550. There are also $800,000 mortgage bonds in the hands of the trustees unissued.

The Kineo and North East Carry Telephone & Telegraph Company of Kineo, Me., is extending its new line to the head of Chesuncook Lake, fifty miles into the wilderness of that State. The work will be completed by August 20. The line is now working between Kineo, the Northeast and the Northwest Carries and the Penobscot House on the west branch of the Penobscot River, the point of arrival and departure for the thousand of canoeists, sportsmen and tourists who annually make the famous west branch, Allegash and St. John trips. This will place sportsmen and others in the wilderness which lies about the Chesuncook Lake in almost immediate communication with the outside world, where before they were from 48 to 96 hours distant in cases of extreme necessity.

T. H. Ewing, the electrical engineer for the Plattsmouth (Neb.) Telephone Company, is about to rebuild and double the capacity of the independent telephone system at Nebraska City, which was recently purchased from J. C. Howe of St. Louis by Judge Paul Jessen, John W. Steimhart, N. A. Duff, Morton Bros., William Hayward and others. Work will be commenced at once and when completed the exchange will work in connection with the Plattsmouth telephone exchange.

Judge A. Van Wageman, of Sioux City, Ia., has completed the organization of a $1,500,000 company at Providence, R. I., to manufacture the Clark automatic switchboard, a device designed to eliminate the hello girl from the telephone business. By its use patrons make their own connections. The invention was conceived several years ago by E. A. Clark, Sioux City manager for the Iowa Telephone Company, but has never been tried except experimentally. It promises to accomplish admirable results in small exchanges.

The Glen Telephone Company of Montgomery County, N. Y., has increased its capital stock from $10,000 to $100,000.

A Curious Telephone Experiment.

Some curious experiments with telephones, provided with ordinary line wires, but devoid of battery or magnet, have been brought before the Societe Belge d'Electriciens by E. Pierard. The transmitting instrument is simply a vibrator. A metallic diaphragm touches, when vibrating under the influence of the human voice, a platinum point fixed to a screwed spindle; contact is really made between the point and a small platinum disk, fixed to the back of the diaphragm. If we place this vibrator in an electric circuit containing a battery and an induction coil, whose secondary comprises an ordinary telephone receiver, we can transmit musical notes, but not speech, because as in the original telephone of Reis, the harmonic overtunes are not produced. If we now remove both the battery and the primary coil, we can still hear, at a distance of 100 feet, music which would be quite inaudible to the unaided ear, though there is apparently no electromotive force in the combination, which, in fact, reminds one of the old string telephone. The action cannot be of the latter kind, however, for the wires may be quite loose, whilst the string telephone requires a stretched connecting string. The effect is increased if we place in the vibrator wire circuit, not a battery, but a coil whose secondary has the same resistance as the receiver coil. That is, we come back to the ordinary telephone arrangement, but we apparently dispense with any source of current. It was thought that the heat, conveyed to the diaphragm by the warm breath, might set up thermo-currents. But it suffices to tap the vibrator with a piece of wood. To settle the problem Pierard tried diaphragms of various metals and thicknesses. When the platinum point touched an argentan diaphragm (alloy of copper, nickel, zinc) directly, no transmission was observed; when, as before, a platinum disk was soldered to the argentan, tunes were transmitted. Zinc behaved in the same way; copper and iron gave a small effect without a contact plate, and a better one with the contact plate; aluminum, no effect at all, probably because platinum could not be soldered to it; brass proved not sufficiently elastic. These experiments seem to indicate that the electric motive force is due to the contact of different metals, the intensity of the effect varying with the area of the contact plate soldered to the other metal. A further experiment supports this view. Sounds were produced by making the ends of the primary rest on a toothed wheel of copper, fixed on an iron journal. When both wires touched copper, no signal was transmitted, when the one rested on the teeth, the other on the iron journal, the clicks were heard.—"Engineering," London.

The National Telephone Equipment Company of Detroit, Mich., lately filed articles of incorporation, with a capital of $100,000, to manufacture switchboard generators and telephone equipments. The president is E. H. Parker, formerly an officer and director of the Detroit Switchboard Construction Company, and prominent in the independent telephone movement until the local company sold out.

The New England Telephone Company is looking over the ground in Millbury, Mass., with the view of establishing a central exchange. With a guaranty of a few subscribers the office will probably be opened. This will mean a great saving to telephone users, and will lower the price of both local and long-distance 'phones. The cost of a chat with Worcester, Mass., will likewise be reduced from 15 to 10 cents.

The Inland Telephone Company of Oregon and the Pendleton system have been practically united, using the same central office in Pendleton. Residents on either line can now talk to any part of the country controlled by either company.

Capt. D. R. Edwards of Lawtey, Fla., is putting in telephone lines connecting all his turpentine camps, etc., with the central office in Jacksonville. He will have in all over 50 miles of telephone wires.

TELEPHONE INCORPORATIONS.

The Home Telephone Company, Lockport, N. Y.—to construct and operate a telephone line connecting the principal points in the County of Niagara. Capital stock, $125,000. Incorporators: M. B. Butler, Niagara Falls; George H. Frost, Buffalo; A. E. Lord, S. R. Rawson, I. H. Griswold, James A. Drake, F. H. Sudro and F. W. Martin, Elyria, Ohio.

The Fillmore Telephone Company, Fillmore, N. Y. Capital stock, $5,000. Incorporators: Charles Ricker, William S. Mills and John H. Howden, all of Fillmore.

The Otisco and Cedarville Telephone Company of Otisco, N. Y—to operate a telephone system between Otisco and Syracuse. Capital stock, $1,500. Incorporators: H. D. Pomeroy and I. W. Bardwell, Otisco; Lee Cummings, Navarina.

The Cedarville Telephone Company, Cedarville, O. Capital stock, $15,000. Incorporators: D. Brodpite, O. E. Brodpite, James H. Andrew, F. B. Turnhill and S. B. Rankin.

GENERAL NEWS.

What is Going On in the Electrical World.

LIGHTING.

Ashland, Pa.—The Northampton Portland Cement Company and J. J. Heintzeman have made arrangements to buy the Charles Mann farm near Nisky and will convert the old grist mill into an electric plant to supply Ashland, Belfast, Stockertown and other places in that vicinity with light and power. Mr. Heintzleman is to manage the plant.

Atlantic, Ia.—The project of enlarging the electric light plant owned by this city is under consideration by the city council.

Aurora, Ill.—The city council recently granted a franchise to the Aurora Street Railway Company to operate an electric light plant in connection with its railway and power plants.

Beaver Falls, Pa.—The council of College Hill Borough, adjoining this place, recently instructed its light committee to plot the town for 30 arc lights, and to advertise for bids for the erection of an arc and incandescent electric light plant.

Carthage, N. Y.—The American Electric Light Company has decided to enlarge and improve its plant at once.

Charleston, S. C.—The city council has decided to erect a municipal electric light plant.

Chicago, Ill.—J. Holt Gates & Co., of this city, was lately awarded the contract for a new electric light plant at Centerville, S. D., and will install a 60 kw. Warren single phase alternator and switchboard, and will use the Bernstein system of series incandescent lighting.

Dalton, Ga.—The city has purchased the gas plant from the private company and contemplates the erection of a new electric light plant next season. S. McAuley, mayor.

Detroit, Mich.—The East Side Electric Lighting Company's plant was burned out last week, the loss being $15,000.

Dunkirk, Ind.—The Chicago Consolidated Power & Water Company will reconstruct the electric light plant at this place.

Elizabeth, N. J.—During a recent storm lightning struck the power house of the Suburban Electric Light Company, demolishing valuable machinery.

Fairport, N. Y.—The citizens of this place have voted to issue $2 ,00 in bonds for erecting a municipal electric light plant.

Forreston, Ill.—Plans are being prepared for the erection of an electric light plant at this place.

Grafton, W. Va.—A New York syndicate has lately offered the Grafton Gas & Electric Light Company $85,000 for its plant. The town is not a large one, yet the stock of the local concern has been selling at $150.

Hackensack, N. J.—Contractor Ferguson has commenced the erection of a new addition to the electric light plant.

Lakewood, O.—Bids are asked until August 10 for erecting an electric light plant complete. Address J. French, clerk.

Leadville, Col.—A new electric light company is to be started here. Dr. J. H. Heron and J. B. E. Smale are interested. An electric light plant will be erected.

Lutherville, Md.—The county commissioners are contemplating lighting this place with electric lights, as it is claimed that it can be done cheaper and better than with gasoline lamps.

Mantorville, Minn.—Electrician R. D. Harrison of Minneapolis lately closed a deal with this town to furnish an electric light plant.

Pine Bluff, Ark.—This city has granted a franchise to W. H. Keyser of Chicago to construct and operate an electric light plant here.

Salem, O.—The city council decided a short time ago to erect a municipal electric light plant.

Schoolcraft, Mich.—An electric light plant may be established for the use of the Commercial House here, and, perhaps, a plant large enough to light business houses.

Shamokin, Pa.—It was lately rumored that a number of prominent capitalists of this city had taken definite steps for the reorganization of an electric light company here.

Tekamah, Neb.—This city recently decided to have electric lights. A committee has been appointed to look into the financial part of the proposition.

Terrell, Tex.—This city has granted a franchise for erecting an electric light plant. D. J. Anthony, mayor.

Union Point, Ga.—H. P. Arnold, superintendent of the Greene County Electric Light & Machine Works of this place, wants prices on one 250 light dynamo, 3,000 feet of line wire, switchboards per dozen, and everything connected with a small electric light plant.

Uxbridge, Mass.—George Z. Taft recently closed the deal with the Uxbridge & Northbridge Electric Light Company over the prospective sale of land near the freight depot for an electric light plant.

Waterloo, Ind.—The citizens of this place are agitating the question of erecting an electric light plant.

STREET RAILWAYS

Absecon, N. J.—An electric trolley line to and along the shore road is among the things promised for the near future. A right of way has been secured to Pleasantville and this place and the line will probably be continued several miles beyond here. It is expected that the new road will be in operation by next summer.

Agawam, Mass.—The selectmen of this place recently granted to the Springfield Street Railway a franchise to run an electric road from the new Agawam River Bridge to the State line.

Akron, O.—It is proposed to build an electric railway between this city and Cleveland. The Cleveland and Southern Railroad Company is back of the project.

Amsterdam, N. Y.—The Fonda, Johnston and Gloversville Railroad Company lately purchased the Amsterdam Electric Street Railway and its lighting and power plant. The railroad will be equipped in first-class style and will be extended to Rockton and Hagaman, a distance of four miles.

Bellevue, O.—The city council recently granted a franchise to the Toledo, Fremont & Norwalk Electric Railway to lay its tracks through this place.

Berryville, Ark.—Berryville will build an up-to date air line electric railway to the depot, two and one-fourth miles north of here.

Camden, Me.—There has been considerable talk about an electric road from here to Liberty which would doubtless prove profitable, as summer boarders fishing parties and cottagers are attracted to, Georges Lake. There is an abundant amount of freight, both in hay, wood and lumber to pay, if proper facilities for carrying could be obtained.

Chattanooga, Tenn.—A recent fire destroyed the power house of the Chattanooga Rapid Transit Company, operating between this city and Chickamauga Park. Loss, $35,000; fully insured.

Chester, Pa.—The Philadelphia, Morton and Swarthmore Trolley Company in this city and county is one of the most peculiarly constructed roads ever built here. This company, which is to have in all about twenty miles of road in this county, has not issued a cent's worth of shares of stock, it has not placed any bonds on the market and has none to place. The road has been founded on the cash basis and is being built better than any road was ever constructed in the county.

Detroit, Mich.—The Michigan & Ohio Electrical Railway Company filed articles of incorporation last week with a capital stock of $200,000. It proposes to build and operate a third rail electric railway between this city and Toledo.

Franklin, Pa.—The Venango Traction Company was lately chartered to build an electric railway eight miles long in this place with a capital stock of $50,000. John B. Smithman, Lewis M. Davison. James H. Forbush, L. Milton and J. S. Crouch of Oil City are the directors.

Larchmont, N. Y.—The Larchmont Horse Railway Company has begun the work of extending its trolley line on the Boston Post Road, and will shortly have it completed from Mamaroneck to New Rochelle. It is rumored that the horses will be abandoned in October and the entire system will be run by electricity.

Milford, Mass.—It is claimed that there is a favorable outlook for the Milford & Uxbridge Street Railway Company which proposes to build an electric road from the end of the Milford, Holliston & Framingham line in Hopedale, through Mendon to Uxbridge.

New York City.—The New York, Westchester and Connecticut Traction Company recently completed plans to gridiron the whole eastern section of Westchester County and a part of Connecticut with a new system of trolley lines.

Oakland, Cal.—Bids are asked until August 6 for a franchise to build and operate an electric railway in Contra Costa County. J. E. Rodgers, clerk.

Ogdensburg, N. Y.—Charles S. Plank has started a movement to secure the extension of the electric street railway from here to Waddington, a distance of eighteen miles, passing through the town of Lisbon and connecting four United States post-offices.

Oklahoma City, Okla.—The council is considering the question of granting a franchise for an electric street car line in this city. G. B. Stone is the chief promoter.

Parma, Mich.—The village council recently granted a franchise to the electric road to construct a track through the village, work to be completed within eighteen months.

Raleigh, N. C.—President John Mills of the Raleigh and Cape Fear Railroad is talking of converting that road as far as Fuquay Springs, into an electric line.

Scituate, Mass.—Several Brockton business men have become subscribers to stock being issued for the construction of a new electric railway from Assinippi, through Norwell, Cohasset, North Scituate, Green bush and this place.

Springfield, O.—Harry Frey was granted a franchise a short time ago by the commissioners for an electric line to be built from here to Hillsboro via Clifton, Cedarville and Jamestown.

Three Rivers, Que.—There is a project afloat for the construction of an electric railway line connecting this place with Grand Mere, Shawenegan, St. Barnabe, St. Severe, Louiseville and Yamachiche. The principal promoters are Mayor Paquin and Mr. P. E. Panneton.

Tenafly, N. J.—It seems to be the wish of a number of the residents of this place that a traction trolley line, to run through this township from Englewood to Closter, should be built as soon as possible. It is claimed that the right of way can be easily obtained, and that the people not only stand ready to give the privilege over their property, but would be willing to subscribe for the enterprise.

Trenton, N. J.—The New Jersey and Philadelphia Street Railway Company, which is backed by Boston capitalists, has lately secured the upper Delaware River Bridge in this city, and by the first of January next expects to be running trolley cars over it from the center of this city to Philadelphia.

COMPANY MATTERS.

Fort Worth, Tex.—The Standard Light & Power Company will be sold complete under order of court, August 7, at auction in this city. The property of the plant consists of new machinery, power plants, miles of wire already strung, and invoices at not less than $65,000 can be bought for less than $25,000, and on almost any terms. Fort Worth has 35,000 people and one other electric company, but the latter company is unable to supply the demand for power. Further information may be had by addressing Thomas P. Martin, Jr., Fort Worth, Texas.

Madison, Wis.—Capitalists of Pittsfield, Mass., are endeavoring to have the plant of the Northern Electrical Company removed to that city and amalgamated with the Stanley Electric Manufacturing Company. It is said that $500,000 has been offered for the Madison plant.

MANUFACTURING.

Chicago, Ill.—The Pumpelly Storage Battery & Electric Motor Company of this city changed its name a short time ago to the National Vehicle Battery Company. Its object is to manufacture storage batteries, motors, etc.

Davenport, Ia.—The Watkins Automatic Electric Current Regulator Company, with a capital of $100,000, has been organized by Davenport and Chicago capitalists, and it is expected that it will shortly be doing business in this city. The company will manufacture the automatic electric current regulator recently invented by Daniel Watkins and now owned jointly by Mr. Watkins and Attorney C. J. Raymann. The patent has been granted, but for various reasons the backers of the company have not yet allowed it to be issued.

Denver, Col.—The Electric Wire Inflater Company was recently formed here to manufacture electric wire on a capital of $10,000. W. H. Smith, George W. Skinner, James A. Skinner, Thomas Keeley and Charles H. Toll are all interested in the concern.

Toledo, Utah.—The Toledo Electrical Power Company recently filed articles of incorporation in the office of the Secretary of State. The capital stock is placed at $50,000. The object of the concern is to establish and conduct an electrical milling and manufacturing business. Joseph C. Ome is president, F. M. Davis vice president, A. J. McCuistion treasurer, Phares Dinyon secretary.

Weston, W. Va.—The Weston Petroleum Company lately sold two big gas wells to a company of Pennsylvanians, headed by O. S. Carves, of Wilkes-Barre, to use the fuel in the manufacture of carbons for electric lights. The gas wells purchased have a capacity of 10,000,000 cubic feet per day, and a pressure of 900 pounds to the square inch.

POWER AND TRANSMISSION PLANTS.

Columbus, O.—There is some talk of a company being formed here to develop water power in Arkansas. James J. McGrath has secured the franchise for various electric lines centering at Hot Springs, Ark., for lighting the city with electricity, and for damming a stream passing the city for the use of the water for domestic purposes.

Watertown, N. Y.—The Watertown Electric Light Company recently purchased the woolen mill and its water power immediately above and adjoining the company's present plant. The purchase was made for the sake of the water power, which the company does not intend to utilize at once, but will hold in reserve until the growth of the city requires the addition to the power now in use.

AUTOMOBILES.

Brookings, S. D.—The Hub Auto-Carriage Company was recently organized here with a capital of $100,000. William H. Ashley, James A. Kilburn, Louis N. Fuller, T. Arthur Fuller, J. P. Cheever, Philo Hall, Geo. P. Hall and Frederick E. Lusk are all interested in the concern.

Toledo, O.—Only about one-fifth of the machinery of the Lozier Bicycle Works will be removed, the balance being left in the Toledo factory to be utilized in the manufacture of automobiles.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16¼@16½c.; Lake, 16½@16½c.; casting, 16@16¼c.

The Honolulu Rapid Transit Company's purchasing agent is buying cars in Philadelphia.

The Denver (Col.) Gas & Electric Company has declared a dividend of 1½ per cent, payable August 20.

Local capitalists have purchased the Portsmouth (Va.) Street Railway for a sum said to aggregate about $500,000.

It is reported that the New York Rapid Transit Commission has decided on a tunnel route from the Battery to South Brooklyn.

President Vreeland says the earnings of the Metropolitan Street Railway of New York for July show an increase of about $85,000.

Directors of the Boston Elevated Company have declared the regular semi-annual dividend of 2½ per cent. on the stock, payable August 15.

Officials of the Union Traction Company of Philadelphia say that the July gross earnings have increased about $2,300 daily. The daily average for June was nearly $3,000.

The directors of the Hartford (Conn.) Electric Light Company have declared a semi annual dividend of 3½ per cent. This raises the rate of dividend from 6 to 7 per cent. per year.

The New England Telephone & Telegraph Company has declared the regular quarterly dividend of 1½ per cent., payable August 15. Books will be closed from August 1 to August 14 inclusive.

A mortgage for $500,000 was recently filed in the Somerset (N. J.) County Clerk's office. It was given by the Plainfield Gas & Electric Light Company to the Morton Trust Company of New York.

Advices from London, England, state that Charles T. Yerkes and P. A. B. Widener are there on the invitation of the capitalists owning the underground railways to discuss consolidation plans.

The Westinghouse Electric & Manufacturing Company has declared a quarterly dividend of 1½ per cent. on its assenting stock, payable August 15. Books close (to day) August 1 and reopen August 16.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 16@18; New York Electric Vehicle Transportation, 7@8; New England Transportation, 4@4½; Gramophone, 35@40.

The General Electric Company has filed a certificate of the increase of its capital stock from $20,827,200 to $25,242,200. The debts and liabilities of the company are put down as $6,889,400. Over $25,000 was paid to the State of New York as a tax.

The Massachusetts Board of Gas and Electric Light Commissioners have authorized the issue of 1,000 shares of new stock (par $100) by the Lowell Electric Light Corporation, to be offered to the stockholders at par, in proportion to their present holdings.

The gross earnings of the Brooklyn Rapid Transit Company system for the year ended July 1 were, in round figures, $11,200,000. The largest June earnings the company has ever had were month before last, when they were within a few thousand dollars of being $1,100,000.

The Philadelphia Electric Company will call an assessment from stockholders of $1.25 a share, payable November 21, and $1.25 a share, payable January 21, 1901. These assessments will raise $2,500,000 cash, a considerable proportion of which will be used for construction purposes.

The North Hudson County Railway Company, the Paterson Railway Company and the Jersey City, Paterson & Hoboken Street Railway Company report for the first twenty-two days of July: Gross earnings, $131,127, against $117,079 in the corresponding period last year, an increase of $14,048. The daily average increase was $638 54

The Railroad Commissioners of Massachusetts have authorized the West End Street Railway Company of Boston to transfer to the Boston Elevated Railway Company $73,754, being the proceeds remaining unexpended from an issue of $600,000 bonds made necessary for the payment of certain permanent additions, alterations and improvements made during the fiscal years ending September 30, 1898, and September 30, 1899.

The board of directors of the Safety Car Heating & Lighting Company has elected William A. Reed, of Vermilye & Co., to fill the vacancy in the board caused by the death of Percival Knauth. The board of this company now consists of the following: Robert Andrews, George F. Baker, Jr., William Barbour, E. J. Berwind, George R. Blanchard, Edwin M. Bulkley, S. M. Dodd, A. B. Hepburn, W. H. Kimball, Gen. Austin Lathrop, Edward Lauterbach, William A. Reed, Thomas C. Platt, A. W. Soper and Dr. Peter B. Wyckoff.

Stockholders of the Chicago Union Traction Company held their first annual meeting recently. Out of a total capital of 320,000 shares there were represented at the meeting 243,673 shares. The old board of directors was re-elected as follows: Jesse Spalding, John M. Roach, R. A. C. Smith, Walter H. Wilson, H. B. Hollins, Charles L. Hutchinson, James H. Eckles, C. K. G. Billings, P. A. B. Widener, William Dickinson and John V. Clarke. The company's statement showed only a nominal surplus after the payment of the dividend on the preferred. Common held its own.

The Boston "News Bureau" says: "The stock of the New England Electric Vehicle Transportation Company has recently advanced from $3 to $5 per share, but at this price the stock is selling for less than the actual amount of cash per share in the company's treasury. The New England Company is having a very satisfactory business, but pending the enlargement of its main station—the old Cyclorama Building—the company has not added to its equipment. It has now about 260 vehicles in service, nearly all of which are leased by the month. It has recently leased ten of its vehicles to the Armstrong Transfer Company for use between the Union stations."

James Lewis & Sons, of Liverpool, in their copper circular, state that for the first six months of this year the consumption of copper has increased 30,396 tons, or 44½ per cent. over that of last year. With stocks smaller and less copper available in this country it is quite likely there will be some sharp bidding in the European market for supplies. Domestic production and importations have been larger in this country to the extent of 16,248 tons during the past six months, but as the exports have increased 35,715 tons the balance for home consumption has decreased to the extent of 19,467 tons, as compared with the corresponding period of last year.

At a special meeting on Monday of Massachusetts Electric Company stockholders it was voted to purchase the Lowell & Suburban Railroad and to ratify the purchase of the South Shore & Boston Railway. The basis of exchange of shares of the Lowell & Suburban was two shares preferred and 1½ common of the Massachusetts Electric Company's stock for one share of the Lowell & Suburban Railroad. The basis of exchange of the South Shore & Boston was one share preferred and three quarter of a share of common of Massachusetts Electric for each share of South Shore & Boston. It was also voted to pay the semi annual dividends in January and July instead of in June and December as at present.

EDITORIAL NOTES.

An American Street Railway Financier in London.

Mr. Charles T. Yerkes, the well-known street railway financier, following in the footsteps of Mr. Tom Johnston, another well-known dabbler in trolley roads, is in London for the purpose, so it is alleged, of doing with the underground roads of the English metropolis what he so skillfully did with the majority of the surface roads of Chicago, namely, form them into one system. A recent cable dispatch to the N. Y. "Herald," states that London is really the only big field open to Mr. Yerkes just now. He attempted a year ago to obtain a controlling interest in the Metropolitan District Underground Railway of London, but his ideas were a little too large for the conservative English capitalists to grasp all at once. Now that they have had time to think about it the Englishmen have invited Mr. Yerkes there to talk it over. Naturally the erstwhile street railway king of Chicago does not care to have the exact nature of his business in London spread far and wide throughout England and this country, and therefore in an interview with the writer of the cable dispatch already referred to he says:

"I came to London simply on the invitation of capitalists here who own the charter of the underground railway. They wished to consult me. While it is not unlikely that I shall invest something in their interest, I have not come here with any plan to revolutionize the transportation system of the city.

"I do not come at the head of any syndicate nor with any project. I am past that stage of my career."

He then goes on to refer to the inadequate transportation facilities of London as follows:

"London is certainly in crying need of modern traction facilities. I am unprepared to say whether or not it is a practicable place for electric lines. London's streets are congested, but there is no street in London as badly crowded as Broadway once was. I have seen Broadway so crowded that it took me twenty minutes to go from Wall to Cortlandt street. The street cars have taken the cabs and omnibuses off the streets of New York, the latter almost entirely, the former in great measure.

"When I look at the Strand in London cannot help thinking what its condition would be were the omnibuses and cabs eliminated.

"In London, from what I have observed in the years I have been coming here, there seems to me to be a good system of underground railways connecting with the surface roads in the outskirts. I would not only give the metropolis splendid intramural facilities, but also give the laboring classes an opportunity to get away from the densely populated parts into the healthy, uncrowded localities."

The road, regarding which Mr. Yerkes' advice is being sought, is that of the Metropolitan District Railway, which comprises some thirteen miles of underground track, tapping the most populous sections of London. There are also several shorter lines, operated or about to be operated by electricity.

That the British capitalists have made an excellent choice in selecting Mr. Yerkes as their adviser is not to be doubted, for if any one can furnish London with up-to-date transportation facilities he can. Incidentally, it should, possibly be looked upon as a compliment to the street railway men of the United States that England has to seek in this country a railway man to tell it how to operate and manipulate its roads to the best advantage.

* * *

Another Alleged Electrical Cure for Tuberculosis.

For several years past accounts have appeared from time to time in the daily papers of methods of curing cancer and consumption by applications of electric current to the diseased parts. Over two years ago it was announced that a physician of this city by the name of J. Mount Bleyer had discovered a method of revivifying the blood of persons affected with tuberculosis by means of an electric current of high voltage, while only recently the so-called Crötte method of curing consumption was given a thorough trial at one of the leading New York hospitals.

In a word, the Bleyer treatment consisted in placing a pad on the patient's chest directly over the diseased portion of the lung and a pad on the corresponding point on the back. A current of electricity at extremely high voltage was then sent directly through the body for twenty minutes or half an hour. This operation frequently repeated was supposed, as already stated, to revivify the blood by giving it ozone.

The Crötte method differs somewhat from

Digitized by Google

that of Bleyer in that a powerful antiseptic was forced through the lungs of the invalid by means of static electricity.

Another electrical cure of this nature is now being tried with alleged excellent results by Dr. C. C. Carroll of New York. The latter, as nearly as can be ascertained, employs a Tesla oscillator and by passing currents of high frequency and high voltage through the lungs of a patient, in time causes the tubercular matter to be eliminated from the system by the emunctories. As will be seen, the Carroll treatment differs radically from that of Crótte and to a certain extent from that tried by Bleyer, although that of Carroll undoubtedly tends to revivify the blood, which was the principal claim made by Bleyer.

Most optimistic views are expressed regarding the Carroll system, the claim being made that by this treatment even patients in the last stages may be benefited if not entirely cured. It is to be hoped for the benefit of mankind that such is the case, but in the light of other experiments of this nature it is to be feared that those interested in the discovery may possibly be too optimistic. That an electric current suitably applied in a case of tuberculosis in its early stages will prove beneficial has been proven, but that it can be made to cure a patient that has but a few weeks to live is hardly to be expected in the present state of the art.

* * *

A Scheme for Telephoning Without Wires.

A Philadelphia inventor, working along the lines suggested by Nikola Tesla some time ago, has succeeded, according to reports, in devising a system of wireless telephony in which the sounds are transmitted from one point to another through the earth by means of so-called terrestrial currents.

Ever since wireless telegraphy has become a fact, inventors not only in this country, but all over the civilized world have been endeavoring to devise a practical scheme for telephoning without wires. Most of the devices suggested have proved impracticable owing to the fact that it has been found well nigh impossible to transmit a wave through the ether without the agency of a relay or contact breaker of a sparking coil, which devices, as is well known, are too ponderous and inert to convey the rapid pulsations of a telephonic message.

The Philadelphia inventor, Prof. A. Frederick Collins, abstained from trying to transmit telephonic vibrations through space and applied himself to experimenting along a more original line, namely that of sending the rapid vibrations of speech through the earth. Referring to this subject he is recently reported as saying:

"In the first place it should be said that while the earth is a poor conductor of electricity the currents projected through it meet with no such resistance as the ether waves utilized by Marconi. The network of telephone, telegraph and electric light wires, trolley wires, tall steel skeleton structures, and the hundred and one obstacles that divert and disrupt air currents are not encountered under ground. Again, some strata of earth are pretty good conductors of electricity, while others are non-conductors. Thus, it is possible to project two currents, say at different depths, and to secure perfect insulation.

"Now, as to syntony, or electric tuning, a term the layman does not understand usually, let me explain. In listening to a phonograph, say, one may distinguish the notes of a certain instrument in a band if he tries to. He simply attunes his ear and his mind to the vibrations produced by that one instrument. So also in wireless telephony. Everybody understands how a tuning fork will respond, that is will sound to a certain note struck on the piano. A scientist, would say it vibrated when something with the same rate of vibration was set in motion.

"Electric tuning is analogous. A given receiver properly tuned will respond to a certain number of ether or air vibrations per second. So it will to terrestrial vibrations, but it will remain unaffected by another rate of vibrations. Thus, any number of ether or terrestrial waves vibrating at different rates would not interfere with one another, nor would any set of vibrations affect any receiver, except the one specially attuned to its rate.

"Now, we take an ordinary Bell receiver and pick up the vibrations set loose at a distant point with no connecting media save mother earth. Each instrument (transmitter and receiver) is connected by wire with two copper plates, or, rather a copper coil and a copper plate proper. The plate is buried in the earth at varying distances from a foot to thirty feet. The copper coil is encased in the cabinet. The sounds—that is, the vibrations—are transmitted over the wire to the sunken plate, thence through the earth to the corresponding plate buried at the receiving point connected with the receiving instrument. Of course, it will be understood that there are batteries attached to the cabinets, and a Crookes tube as well."

Prof. Collins is said to be at work on a system of electrical resonance by means of which any number of subscribers may be able to converse without interfering with one another. This he hopes to accomplish by a system of like resistances. In other words, to call up a given subscriber, the ohmic resistance of the instrument of the person calling will have to be made equal to the electrical resistance of the instrument with which connection is desired.

Out of door tests have been made with Prof. Collins' apparatus with success, so it is claimed. As yet the system is in a somewhat crude state, but the principle on which it is based has been verified, and larger instruments will be built and tried in the near future. These experiments will be watched with interest by the technical fraternity.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

We are in receipt of the 1900 edition of "Municipalities vs. Private Corporations," by M. J. Francisco. This work, which has been brought thoroughly up-to-date, contains tables showing cost of lights furnished by private companies and municipal plants throughout the country, a list of municipal plants sold or abandoned, experience of municipalities and much other information of value. The author handles this subject of municipal ownership as it should be handled — without gloves, and states facts that will tend to throw advocates of municipal ownership into a state of nervous prostration.

A new writing and picture telegraph, the invention of a Mr. Foster Ritchie, is described in a general way by the London "Electrician." The device is said to differ from the majority of other picture telegraphs in the rapidity with which the sketch or message is transmitted, the pen on the receiving instrument moving as fast as an ordinary writer moves the pencil of the sending instrument. No skilled operator is required, and the transmitting pencil is moved by the writer of the message. "We tested the instrument ourselves," adds our contemporary, "and found that, although the handwriting may be slightly distorted, its character is not changed, and a diagram sketched was faithfully reproduced. The instrument is so arranged that no impression is made on the receiving instrument when the pen is moved above the paper, a contact being made by the pressure of the pencil. The instrument will work on an ordinary metallic circuit line." From the above somewhat meagre information we should judge this alleged new invention is similar to the telautograph brought out by Prof. Elisha Gray some years ago.

It is stated that the Manhattan Railway Company of this city will be running experimental trains by the third rail system on part of the Second Avenue line before Oct. 1. The power will be obtained from the Metropolitan Street Railway Company.

If reports are to be credited, wireless telegraphy will shortly be made use of in the land of the flying fishes, as a body of troops recently arrived at Tien-Tsin is reported to have taken out from England a number of Marconi instruments.

Mr. A. A. Knudson, the well-known electrolysis expert, recently made an exhaustive examination of the water mains of Providence, R. I., with a view to ascertaining to what extent they were being affected by electrolytic action. In a lengthy report submitted, Mr. Knudson finds that the principal cause of the escape of the electricity from the trolley rails is in the defective bonding of the rail joints. This permits the return current to shoot into the ground, and seeking another conductor get into the water pipes. While Mr. Knudson thinks it is not within his province to specify methods to be used by the railway company to control their currents better, he recommends that attention be called to the necessity of early action to correct the excessive escape of current. Not only should the bonds be replaced, but the frogs and switches at all other turnouts should be tested and those found defective promptly renewed.

Experimental work has been going on for some time at Milwaukee, Wis., on a submarine boat of the Raddatz type, and those conducting it seem to be pleased with the results. The boat is about 65 feet long and 4 feet diameter in the middle, tapering to a point at the ends, and is of the typical cigar shape. At the top of the boat are two conning-towers 20 inches in diameter. When cruising on the surface the boat is driven by an oil engine of about ten horse-power, which is capable of giving the vessel a speed of from six to seven miles an hour. When submerged the boat is driven by an electric motor fed from sixty-two cells of storage battery, and giving power to produce a speed of four to four and a half miles an hour. The boat can sink in from thirty to forty seconds, and reaches a depth of 40 feet below the surface. The ascent is made just as

Digitized by Google

quickly. It is claimed that three men could remain below the surface eight hours, and two men at least twelve hours without any inconvenience: this in the small experimental boat. The boat carries its own supply of compressed air.

It is stated in Washington, D. C., that in accordance with an agreement reached by the Powers, the Eastern Extension Cable Company is laying a cable connecting Taku, Port Arthur, Chefoo and Shanghai. The cable is to be ready for service as soon as possible, certainly before the Gulf of Pechili freezes over. Should hostilities continue during the winter, the telegraph line between Chefoo and Shanghai would probably be cut. Land communication between Port Arthur and Siberia would be impossible, and without this new cable the allied troops would be as effectively cut off from communication with Europe and America as the ministers are at Pekin. Officials figure the cost of the cable at about $1,000 a mile or a total of $900,000 for the line. It is understood that the several Powers taking part in the restoration of peace and order in China will pay an equal share of the cost, about $125,000 apiece.

An automobile club is about to be organized in Westchester County, N. Y., by Howard Willets, Paul G. Thebaud and others.

The cable steamer Silverton, engaged in laying the cable for the Commercial Cable Company from Canso to New York, completed the work last month, and the cable is now being used by the company for the transmission of messages. This makes the fourth cable now operated by this company from New York to Canso, three from Canso to Waterville, Ireland, and one from Canso to the Azores and thence to Germany. As all of these cables are working duplex, it is practically the same as eight single wires.

Work has been begun on a new power house for an electric plant on William K. Vanderbilt's Idle Hour estate at Oakdale, L. I. The building is to be of brick, with limestone trimmings, and inside it will be finished with enameled brick and will be large enough to contain four boilers and the other machinery necessary to the plant. The wires will run to the new residence in an underground conduit.

The Pennsylvania Railroad Company will shortly begin the work of introducing the electro-pneumatic signal system between Philadelphia and Rosemont on the main line. For some years the officials of the company have been quietly substituting the automatic signaling system for the regular block system. It will take some time to put this system in operation, as ten miles of the road, embracing over forty miles of track, will have to be connected. It is the intention of the company to eventually have all its system equipped with electro-pneumatic signals.

An auxiliary step for electric cars has been brought out by the inventor, S. B. Fuller of Pawtucket, R. I. When not in use it is turned up out of the way. There is a separate step for each row of seats, and all are controlled from any part of the car. A continuous shaft is attached to the under side of the stationary step. The movable step is held loose on the shaft, which has sprocket wheels connected by chains with sprockets on the under sides of both end platforms. Arms on the sprockets are operated by foot pressure to bring the steps upright, and a spring turns the shaft back when the foot is removed from the end of the rod. All the steps have the same arrangements, and one or all can be let down, and when raised are caught by a bolt. A pair of electric magnets back of a bar on the end of the bolt draw it out when the magnets are energized and let the step down. Current is turned on and off the magnets by a push button at the end of the seat, and when the circuit is closed the magnets draw the bolt and permit the step to drop for the convenience of the stout passenger. The conductor is able to press a button and let down steps on either side of the car, and the steps are turned up by the movement of the foot rod. The letting down of a step indicates to the approaching passenger where there is a seat, and a bell rings continuously while the step is down so that the conductor is not liable to forget to turn it back, and thus lessen the chances of collision with teams.

U. S. Consul Hughes at Coburg informs the State Department that the work of laying the new German-American cable from Emden to New York is now proceeding. By the end of the summer it is expected that the entire 4,984 miles of wire will have been laid, so that the new cable may be formally opened in October. The section from Emden to Berkum Island is laid partly on land, but from there to New York it is an all sea line. The cable will cost about $4,866,500.

The local postoffice officials at Washington, D. C., are much pleased with the work of the automobile mail wagons which have been given their first trials in that city. Big savings were effected in the collection and the delivery of mail. The manufacturers say that there will be considerable economy in the operation of the machines. If that can be demonstrated it is probable that they will be rented by the local postoffice. The wagons are enclosed at the front with glass windows, and the carrier occupies a stool on a small platform at the rear. There the electric machinery is at hand and through the glass windows he sees to guide the wagon. The carrier can step off at every letter box without the loss of much time. A large electric automobile has also been used in transferring mails in quantities to the sub-postoffices.

The street car magnates of Chicago are going to cut fares to three cents whenever the auto-bus competition gets sharp enough to make serious inroads in their business. The first electric bus line was put into operation in that city last week. This week will see the installation of another, with nine vehicles, to run from Lincoln Park and later from Garfield Park to the business district and to the railway stations. These vehicles are propelled by storage batteries, and can accommodate twenty passengers. The fare for a ride one way is five cents.

A patent has been secured by an inventor in England for converting floor dust, house or other refuse into fuel, for burning in either open fire grates, marine, railway, or other furnaces, as a substitute for coal by mixing it with charcoal, (either animal or vegetable) oil, or other caloric and inflammable substances. The cinders, dust, etc., are first pulverized or ground to atoms, mixed with proper proportions of charcoal, oil, etc,, until of the consistency of paste, then placed in moulds of any desired shape or size and pressed into solid blocks, which are then air or kiln dried and ready for use. Those intended for open grates are made more inflammable, so as to burn up quicker and brighter than those meant for use as slow combustion fuel, or in furnaces where a forced draught is obtainable. The inventor has named this fuel "Pyrojim," and claims that it will burn thoroughly with very little ash and hardly any smoke; will not only be cheaper than coal, but give much greater heat than the best coal, and take up about half the storage space, the latter feature making it particularly valuable for use in steamships.

In the parish of Runwell, Essex, England, an apparatus ha been erected lately by the rector for ringing the church bells by electricity. The origin of the invention is rather curious. The rector, finding a difficulty in obtaining bell-ringers, rung the bells for three months himself. In order to save the labor involved in performing this task, he invented the "automatic ringer," and erected the apparatus in the church tower. By connecting the machine with the electric current already in use for lighting the church and rectory, he succeeded in ringing the bells with perfect order and precision. The invention is in all respects an absolute success.

It is reported that the London Underground Electric Railroad, opened last week, has been a tremendous success, so far 80,000 people having used it daily.

The Postoffice Department has opened negotiations with the North Jersey Street Railway Company, and the Jersey City, Hoboken & Paterson Street Railway Company for the use of trolley lines for mail-carrying purposes. The mail-wagon service will expire July 1 next. It is also proposed to deliver mail from the Jersey City office to Hoboken, Secaucus, Rutherford, Carlstadt, Passaic and Paterson, N. J., by trolley cars.

There is soon to be put into practical use in Richmond, Va., a new device in the way of an electrical invention, which will prove of general benefit. This little machine is known as the Avon meter—a device for measuring electricity, as gas is now measured, and with as much if not more accuracy. This machine is manufactured in London, Eng., and so far not one has been sold in America, having been only used here in a test which was recently made in New York City, in which the machine proved its worth and accuracy. An official test of the Avon meter will be made in Richmond on the first of next October, by the Richmond Passenger and Power Company, and if success is proven, then it will be put into general use in that city. The indications are that the machine will be universally adopted, as the need of it has long been felt, and it will in a short time become as common in use, as the gas meter.

Mrs. Ira E. Tutt of Long Beach, Cal., runs an electric plant that lights Long Beach, Terminal Island and San Pedro. The plant is in every way up-to-date. Mrs. Tutt is an expert in machinery. She selected the proper grounds and directed all the details from first to last, even to putting up the poles and wires.

INTERNATIONAL ELECTRIC COMPANY'S EXHIBIT AT PARIS.

BY FRANK C. PERKINS.

Mr. Henri Pieper is the general director and the founder of the International Electric Company of Liege, Belgium, which started in 1819 from small beginnings and has developed into one of the most important electrical works of Europe with branch factories in Russia and France and agencies in other countries.

Through the increase of the business it was found necessary to reorganize the company and Mr. G. J. Melms of the United States was

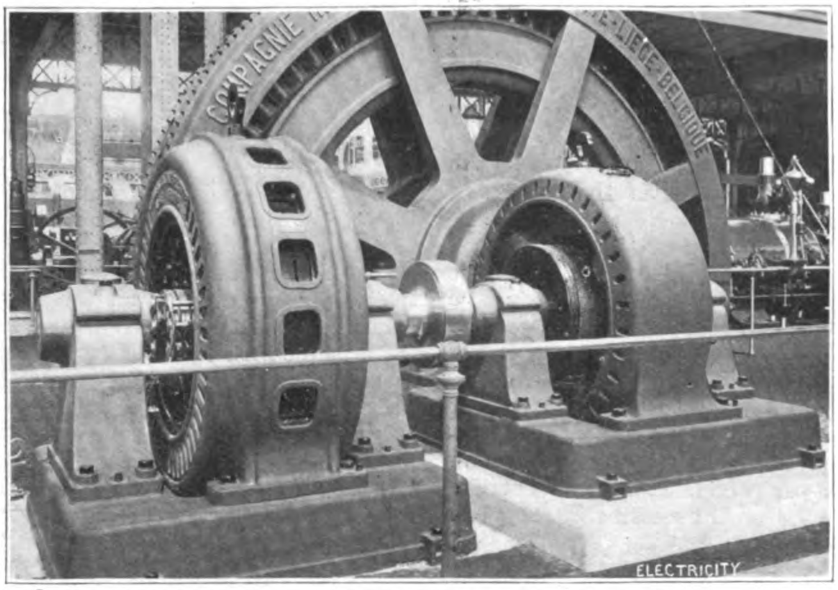

Fig. 1.—1,000 K.W. 3-Phase Generator and Transformer.

called into the firm as manager and technical director.

Mr. Melms has held several important positions in the Thomson-Houston Company also in the General Electric Company and was from 1884 to 1890 manager of Messrs. Brown, Bovery & Co., of Frankfurt, Germany.

Under the charge of Mr. Melms the Frankfurt municipal electric station, one of the largest central power stations in Europe, was constructed and operated.

The exhibit of this company at the Paris Exposition is one of the most interesting, and consists of electric hoisting machinery, continuous current and polyphase current dynamos. The largest generator exhibit by this firm is of the three-phase type of 1,000 kilowatts capacity operating at a potential of 2,200 volts. This machine is partially to be seen in the accompanying illustration, Fig. 1. It is direct connected to a steam engine of Belgian manufacture which operates at 83 revolutions per minute. This alternator has 72 poles in the field magnet and the frequency at the above mentioned speed is 50 cycles per second. This three-phase machine is utilized in the regular service of the Exposition and has an efficiency of 94 per cent. The exciter used is a direct current dynamo of 23 kilowatts capacity and operates at 110 volts potentially.

A second three-phase generator exhibited by the International Electric Company has a capacity of 80 kilowatts and operates at a tension of 530 volts. The speed of this machine is 600 revolutions per minute, the frequency also being 50 cycles per second. The efficiency of this generator is 90 per cent., the exciter being a direct current machine generating 20 amperes at 20 volts. The exhibit of direct current machines of this firm as well as transformer and switchboard apparatus is very satisfactory and interesting. The main switchboard showing the switches, meters, and general construction may be seen in Fig. 2, while the electric cranes and other hoisting machinery is particularly interesting.

THE PREVENTION OF SCALE AND CORROSION IN BOILERS.*

BY R. D. SUMMERFIELD.

Although this question is one on which very much has been and is being written by many of the foremost engineers in the country, the author feels that no apology is needed for reiteration on this subject, both on account of its importance and of the fact that even now the majority of steam users appear to be either ignorant or careless of the proper treatment of feed water in order to prevent scale and corrosion in their boilers.

Before putting down any boiler the nature of the proposed feed water should be taken into consideration, and several samples of it ought to be sent to a competent chemist for analysis, so that before the boiler is put to work arrangements can be made for purifying the water in accordance with the results of the analysis.

The indiscriminate use of the nostrums advertised for purifying feed water will in most cases lead to disappointment, as although they may each be of use for some particular kind of water, yet in any other water they would probably do more harm than good, removing the scale, perhaps only to corrode and pit the plates.

There are, however, several makers of patent boiler fluids who analyze the feed water first and then supply a preparation to suit it, but as the use of soda in the proper manner and proportion will bring about the same result much more cheaply, the use of any patent fluid is quite unnecessary.

Apart from these patent preparations, the number of different substances which have been put into boilers with the object of preventing or getting rid of scale is almost incredible. Paraffin, soft soap, tallow, oak bark, elm bark, nutgalls, sugar, molasses, starch, soda, potash, lime, linseed, carcasses of animals, potatoes, spoilt flitches of bacon, logwood chips, sawdust, muriate of ammonia, or sal ammoniac, washing over with Portland cement, or with blacklead and paraffin, Irish moss, chloride of tin, etc., are some of them, and many of these are used regularly at the present day.

The impurities of feed water are of two kinds—those held in suspension and those held in solution. The former consists of particles of clay, earthy matter, sewage, refuse from towns, etc., disturbed by the water in its passage, and may be gotten rid of by allowing the water to remain quiet for some time, when the impurities held in suspension will fall to the bottom as fine mud.

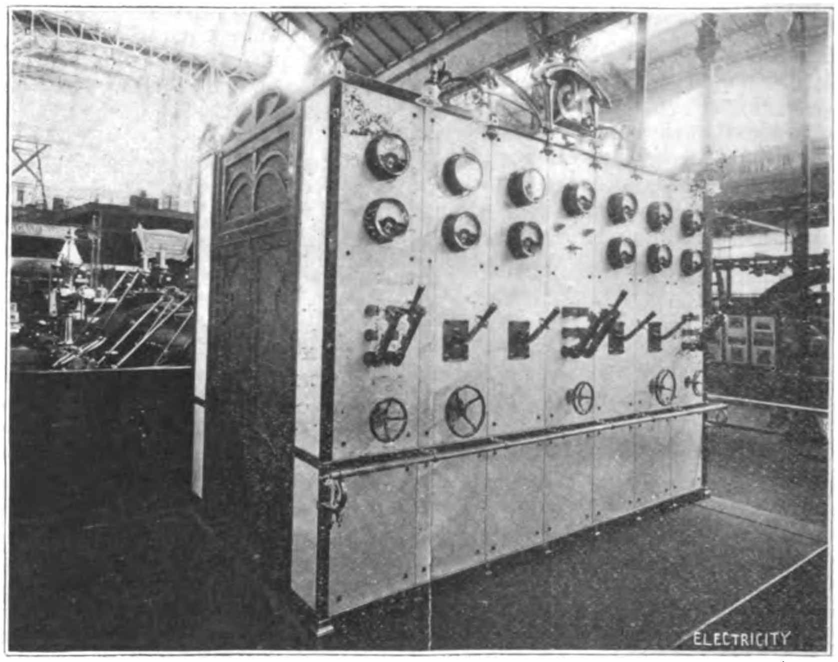

Fig. 2.—Main Switchboard of International Electric Company's Exhibit at Paris.

The impurities held in solution in most waters drawn from rivers, canals, lakes or wells consist principally of sulphate of lime, bicarbonate of lime, and carbonate of magnesia, and analysis may also show traces of silica, salts of iron, sulphate of potash, chloride of magnesia, nitrate of calcium, and various acids, but the three first named, especially the

* From the "Electrical Engineer," London.

Digitized by Google

sulphates and bicarbonates of lime, are nearly always present in quantities out of all proportion to the remaining impurities.

Carbonate of lime, the principal constituent of selenite, chalk, marble and limestone, is held in solution in fresh water by an excess of carbonic acid, and is really present in the form of a bicarbonate. In order to precipitate this, the excess of carbonic acid must be gotten rid of, and this can be done either by heating the water or by employing a re-agent. The solubility of the bicarbonate diminishes with an increase in temperature, becoming nil at a temperature of about 290 degs. F., corresponding to a gauge pressure of about 45 lbs. per square inch. At the ordinary pressures of 80 lbs. to 150 lbs., it is rapidly precipitated in boilers or feed heaters.

The precipitation may also be caused by introducing caustic lime or caustic soda into the water, as these substances take up the excess of carbonic acid and set free the carbonate of lime, which falls to the bottom as a white powder and settles in the quietest parts of the boiler, where the circulation is worst, remaining for some time as soft sludge or mud, but if not blown or washed out it cakes into a hard mass, which has to be chipped off.

In the lime process, such as Clark's or Archbutt and Deely's, about half a grain of caustic lime is added per gallon for each grain of bicarbonate, which causes a precipitation of nearly twice the weight of the caustic lime introduced, but this process requires for its successful application large settling tanks, containing not less than six or seven hours' water supply, besides other plant, so that the first cost is high and a good deal of space is required. These objections are often sufficient to prohibit the adoption of this system of purification.

In the caustic soda process the precipitation may be carried out in the boiler, only one small tank being required in which to mix the soda with the feed water. The proportion per 1,000 gallons is 1½ oz. of pure caustic soda for each grain of lime per gallon; for instance, a water containing 10 grains of bicarbonate per gallon would require $10 \times 1\frac{1}{2} = 15$ oz. of caustic soda for each 1,000 gallons. Carbonate of lime is soluble in 62,500 parts of pure water at freezing point.

Sulphate of lime, which is the same as gypsum or plaster of paris, is also insoluble in water at a temperature of about 300 deg. F., its greatest solubility being at 95 deg. F., when it dissolves in 393 times its weight of water. At freezing point it is soluble in 500 parts of pure water, and at boiling point in 460 parts. If allowed to settle on the plates the sulphate soon forms a hard scale, sometimes as hard as stone, which causes great danger of overheating, and great loss of fuel, about 10 per cent. more fuel being required with scale $\frac{1}{16}$ in. thick, and double the quantity of fuel when the scale is ½ in. thick.

The sulphate may be precipitated in the same way as the carbonate by heating the water to a temperature of about 300 deg. F., corresponding to a gauge pressure of 50 lbs. per square inch, or it may be precipitated by the addition of pure carbonate of soda, in the proportion of 1¾ oz. of soda per 1,000 gallons of water used for every grain of sulphate of lime per gallon found in the water. Thus, if a water were found on analysis to contain five grains of sulphate per gallon, then $5 \times 1\frac{3}{4} = 8\frac{3}{4}$ ounces of carbonate of soda would be required for each 1,000 gallons of water used, but care should be taken that the carbonate of soda, and also the caustic soda used [for carbonate of lime water, are as pure as can be obtained, or foreign substances may be introduced into the water, which may bring about chemical changes by no means to be desired.

Carbonate of magnesia, or magnesian limestone, forms scale in the same manner as carbonate of lime. It is soluble in 5,532 parts of pure water at 32 deg. F., in 9,623 parts of water at 212 deg. F., and insoluble at the same temperature as carbonate or sulphate of lime. It may be precipitated by the use of carbonate of soda in about the same proportion as for carbonate of lime, but the best way to get rid of it is to heat the feed water before entering the boiler. In brackish water chloride of magnesia may be present, and when concentrated this decomposes at 212 deg. F., forming magnesia and hydrochloric acid, which latter, on being set free, rapidly corrodes the iron.

This brings us to the question of acid waters, which are as dangerous, although not so common, as scale forming waters. Besides the hydrochloric acid, which is formed as mentioned above, water may contain tannic acid, produced by the decomposition in the water of the bark, leaves, or wood of various trees, such as oak, hemlock, logwood, etc., acetic acid., formed by chemical changes from sugar or other sweet substances, carbonic acid, produced in putrid waters, or waters turning putrid, and various other acids, which all, however, show their presence by pitting or corroding the iron plates and other parts of the boiler more or less rapidly. Acid waters should be treated by the addition of an alkali in order to neutralize the acid. The best alkali to use is pure carbonate of soda, which should be added in the proportion of one grain of soda per gallon for each degree of acidity in the water. The soda should be mixed with the feed water in a separate vessel before it enters the boiler, as it often causes foaming when introduced into the boiler itself.

Although the chief danger to a boiler from the presence of oil or grease is overheating and foaming, yet substances of this description are also indirectly the cause of scale and corrosion, and great care should be taken to prevent them entering the boiler. The grease or oil floats on the surface of the water and mixes with the carbonate of lime, which, when it is present, often floats on the surface also as a loose powder before it falls to the bottom. The mixture of oil and lime forms a sticky paste, which adheres to the hot parts of the boiler so closely that blowing out two or three times a day will not move it, and in time it becomes a dangerous scale. Then the grease may decompose and form acid, as mentioned before.

Feed water drawn from the hot-well of a condensing engine is always more or less greasy, and should be passed through a good oil-filter before entering the boiler, but as grease or oil may enter from other sources—from the boiler fittings for instance—a scum trough should be fixed in the boiler, and this should be blown out every time the bottom blow-off cock is opened, say three times a day. Blowing out is a most important point in the prevention of scale. It should be done at regular intervals several times a day when the boiler is working, no matter whether the water has been chemically treated before it enters the boiler or not. The great point, however, is to prevent the scale-forming substances from entering the boiler at all, so that it may contain nothing but sweet and pure water, and practically the only way to bring this about is to employ some form of feed-water heater.

The proper way then to treat feed water containing sulphate or bicarbonate of lime or carbonate of magnesia is first to dissolve in it pure soda in the proportion mentioned above, and after that to pass it through a vessel in which it is heated to a temperature of about 300 deg. F. before entering the boiler.

The design of an efficient feed heater is not a simple matter by any means. Numbers have been tried, and quantities of patents are still taken out in connection with them, but the best are a long way from engineering perfection. The principal points to be considered in a heater are that the water must not pass through too quickly, in order that the impurities may have time to be precipitated. For this reason also the heating surface must be as large as possible; the heater must be strong enough to stand the full boiler pressure; it must be simple, not liable to get out of order, easily gotten at, and easily cleaned out, which last is the most important point about it, as its efficiency depends on the cleanliness of the collecting surfaces, and if these are difficult to get at, the cleaning will surely be shirked by the boiler attendant, with the result that the water, not being able to deposit all its impurities in the heater, owing to the thick deposit of scale already there, carries the remainder into the boiler.

In the author's opinion the question of cleaning should receive more consideration than any other in the design of a feed heater; he would suggest that the shell of the heater be a plain cylindrical drum having a cover bolted to each end, the drum to be of sufficient diameter for a man to work in, and to be placed across the main flue in such a position that both covers might be easily taken off for cleaning. The feed water, after passing through a tank in which a proper proportion of soda has been dissolved, should enter at the circumference of the drum, and pass over to the surface of the outer shell, afterwards passing over inner surfaces, and finally being taken away to the boilers from the center of the heater. The internal part, consisting of baffle-plates and water passages or tubes, should be made to slide easily into the drum, so that it might be withdrawn bodily for cleaning, and a duplicate internal part should be provided, which could be slipped into the drum as soon as this had been scraped out. This would greatly lessen the time during which the heater would be out of action, and would ensure the thorough cleaning of the part taken out, as the manager would be always able to see it before it went into the heater again. It is important that the cleaning should take place at regular intervals, depending on the quality of the feed water. With some waters the heater might require cleaning out every three or four days, while with others a monthly or bi-monthly cleaning would suffice; the quality of the feed will also determine the amount of water which must be blown out of the heater every day through the blow-off cock, generally a quantity equal to the contents of the heater should be blown out every six hours.

In the author's opinion a suitable feed-water heater and purifier is as necessary to a boiler as the firegrate, and when steam users generally begin to realize the enormous saving in the coal bill which is effected by a boiler always clean and free from scale, no doubt feed heaters will be considered indispensable.

Digitized by Google

At present there is no heater on the market which can be said to have stood the test of time satisfactorily, and many persons have even discontinued the use of them after a time, principally owing to the difficulty of keeping them properly clean. This question of cleaning is of the utmost importance, as mentioned before, but it is a point which inventors often miss, and in fact one which is frequently missed by buyers as long as the apparatus gives good results when new.

This refers to boilers quite as much as to feed water heaters. For instance, during the last few years a number of water-tube boilers have been brought out with variously curved tubes, and some of these boilers have given wonderfully good results when tested for efficiency: but unless the water supplied to them has been purified, or is naturally pure, the author imagines that this efficiency will soon fall below that of an ordinary Lancashire boiler unless they are kept very clean, the cost of which will probably more than equal any increased gain in evaporative power—in fact, it is probable that a short experience of these kind of boilers will bring out the fact that without a thoroughly efficient feed-water purifier the enormous cost of cleaning the tubes will prohibit their use altogether.

ELECTRICAL MEASURING INSTRUMENTS.*

BY J. FRANKLIN STEVENS.

(Concluded from page 56.)

There is no one line connected with the electrical industry in which so much attention must be paid to details as in the manufacture of electrical indicating instruments. A very prominent engineer remarked to me recently that he had examined the construction and operation of a great many different types of indicating instruments, and, while a number of them bore evidence of similarity in design and construction, yet in some cases the manufacturer seemed to have acquired the "trick" of proportioning, manufacturing and calibrating, while others utterly lacked the "trick." As a matter of fact, it is not altogether a case of acquiring the proper "trick," but is a case of studying the theory and design of instruments for a number of years, backed by a large and varied experimental experience, which marks to-day the difference between the successful and unsuccessful instruments in the various types commercially exploited. Account must be taken of the most petty details of construction, the most careful and skilled labor must be employed in each department, and every particle of material entering into the instrument must be carefully selected and tested with reference to its particular function.

Personally, I have seen the experiment tried of taking a finished and efficient instrument and placing it in the hands of a careful and skilled mechanic for duplication; every wire and every part would be, apparently, an absolute copy of the original, and yet the results obtained would be totally different. It follows, therefore, that it is always wise in placing orders for electrical instruments to select a house who has publicly demonstrated the fact that it has learned the necessary "trick" or "tricks" of its profession.

In no line does reputation count for more than in the manufacture of indicating instruments, nor is there any line in which I have been brought in contact where it takes so long a time to establish a reputation. Further than this, there is no line in which a greater amount of patience is required by the manufacturer. The average purchaser is totally ignorant of the laws or principles embodied in the instrument he is using, and, without regard to the fact that he may have selected the wrong type for the particular class of measurement he wishes to make, unhesitatingly blames the manufacturer for not having known what he wanted and for not having supplied him with the proper type of instrument by pure intuition.

Another obstacle which is commonly met by instrument manufacturers is the fact that for the average installation he is required to furnish instruments delivered to the switchboard contractor, who may or may not handle the instrument properly. It is true that most instruments are sealed, yet it is perfectly possible to utterly ruin the calibration of almost any type of instrument by improper handling without destroying the seal or opening the case. For instance, if a D'Arsonval instrument is laid upon the frame of an actively excited dynamo or motor, its entire calibration will be almost instantly changed, and yet no external evidence is presented to show exactly what has happened. Rough handling and an occasional fall, or improper packing for delivery to the plant, may further operate to destroy the accuracy of the calibrated instrument; yet the manufacturer is expected to provide instruments which will stand such usage and which, after they have been installed, may be subject to the influence of such strong external fields or such high external temperature as to make their correct indications impossible; and, after all of this, must have his instruments accepted or rejected by the consulting or supervising engineer, who, on the day of the test, carefully checks them with his personal portable instruments, which are usually kept in almost ideal condition and seldom or never leave his immediate possession. Some day I trust these conditions may be modified to the extent that the engineer in charge will test and check the instruments, if he doubts the accuracy of the maker's calibration, before the instruments are shipped; or else issue instructions that the switchboard shall be drilled from template and the instruments set in place by the engineer's own assistants. In several cases I have succeeded in having the latter course adopted, with the result of mutual satisfaction on part of the owner, engineer and ourselves.

If arrangements could be made to have all instruments installed under the supervision of the engineer in charge, it would then be quite sufficient to have the specifications state the limit of error allowed in the indications of the voltmeters and ammeters; and this information, coupled with a specification covering the style of case, character of scale, range and class of measurement to be made, would enable the manufacturer to make an intelligent tender for the instruments required in any installation.

While a high degree of accuracy is desirable in all indicating instruments, it is particularly important that the voltmeter should be right within at least 1 per cent., since a variation of 1 per cent. in voltage means a corresponding variation in the candle-power of every incandescent lamp which may be in circuit. It is quite well known that the candle-power of any incandescent lamp varies directly with the voltage, the variation being approximately 1 candle-power for every volt increase or decrease from the normal voltage of the system.

Further than this, a variation of 1 per cent. from normal voltage on a system carrying incandescent lamps means a variation of about 16 per cent. in the life factor of the lamp and about 3 per cent. in the watt consumption per candle-power. Errors in the indications of ammeters do not produce such serious results, yet it is desirable that they should be accurate in order to obviate the danger of overload on circuit, translating device, or generator; and in the case of test instruments, as high a degree of accuracy should be demanded as is required in the voltmeter.

While on the subject of accuracy of indications, I would like to impress upon you the fact that, while we have three electrical units in common use, namely, the volt, ohm and ampere, the ohm and ampere are the only two fundamental units, the volt being a derived unit. The absolute ohm may be quite readily obtained, and, as you probably know, is defined by law as the resistance offered to an unvarying electric current by a column of mercury at the temperature of melting ice, 14.4521 grams in mass, of a constant cross-sectional area, and of the length of 106.3 centimeters. The ampere is likewise defined by law as the practical equivalent of the unvarying current, which, when passed through a solution of nitrate of silver in water in accordance with standard specifications, deposits silver at the rate of .000118 gram per second. The volt is defined as the electromotive force necessary to send 1 ampere through 1 ohm. This, as you will note, gives us fundamental values for the ohm and ampere and defines the volt as a derived unit, and I am laying stress on the matter for the reason that the average electrical writer defines the volt as a fundamental unit equivalent to $\frac{1000}{1434}$ of the potential at the terminals of a standard Clark cell, and then defines the ampere as that current which 1 volt will cause to flow through a resistance of 1 ohm. As a matter of fact, the Clark cell is a secondary standard, exceedingly useful in practice, but not designed for use as a fundamental standard, due to the fact that Clark cells will vary among themselves, and will give a gradually decreasing voltage at their terminals after they have been in service any length of time. It is, further, impossible to take 1 ampere from a single Clark cell without permanently ruining it; and, as a matter of fact, the potential of a Clark cell is only correct when the cell is used on open circuit.

It has been rather difficult for me to understand why the absolute ampere has been so little used or so seldom referred to when it is a unit more readily verified than is possible with the volt. It is true that the fundamental method of determining the ampere is rather slow and tedious, but it is extremely easy to obtain the absolute ampere in c. g. s. units by the use of the tangent galvanometer. Defined in c. g. s. units, the ampere is such a current that, passed through a conducting wire bent into a circle of the radius of 1 centimeter, will attract a unit magnetic pole held at its center with a force of one dyne; and this method applied to the tangent galvanometer gives the very simple formula of current equals galvanometer constant into the tangent of the angle of deflection of the polarized needle, the galvanometer constant being readily determined from its dimensions and the number of turns

* Paper read before the Electrical Section of the Franklin Institute, Philadelphia Pa., April 24, 1900.

Digitized by Google

of wire, in connection with a determination of the value of the horizontal component of the earth's magnetism. Having once determined the absolute c. g. s. value of the ampere, we know that the practical ampere is one-tenth the value of the c. g. s. unit. Having obtained the absolute standards of current, expressed in amperes, and resistance, expressed in ohms, the standard volt is readily determined from the relations given in Ohm's law. With the primary units once determined, all others, such as the farad or coulomb, can be readily obtained.

To obtain absolutely correct standards of voltage and current for alternating current calibration it is only necessary to calibrate a dynamometer voltmeter and a dynamometer ammeter in true volts and amperes as determined by fundamental standards; then, as a dynamometer measures directly the square root of the mean square, it will indicate correctly the virtual voltage or current in an alternating circuit. In calculating resistance in alternating current instruments it is necessary to modify Ohm's law to the extent of substituting impedance for resistance. Since impedance is the vector sum of the ohmic inductive resistances, it is readily obtained by triangulation when the two resistances are known, or when one is known and the angle of lag can be ascertained.

While the design, workmanship and material entering into the construction of an instrument are of vital and fundamental importance, the actual calibration is equally important. Assuming the manufacturer has reliable standards of voltage, current and resistance, trained observers are necessary who should be instructed not only to properly mark the scale but to check it, and should also be instructed to carefully test the instrument for errors due to reversal, to lag or hysteresis, and for errors introduced by the presence of external fields, or by the variations of internal or external temperature. Certain definite limits must be set for errors allowed and no instrument permitted to go out until it has fully come up to the standard so set. In the company with which I am associated we not only make all of these tests and check readings, but likewise provide an additional check on the calibration by plotting the calibration curve at the time the scale is made by the draughtsman, and if errors or irregularities are observed in the curve showing a departure from the standard curve applicable to the type of instrument under construction, the instrument is promptly returned to the calibrating room to have its readings checked, or to hunt for and remove the defect which caused the irregularity. It is a known fact that for every type of system there is a characteristic scale, following a more or less complex law, and any variation of the calibration from the normal indicates immediately that there is something wrong, either in the construction of the instrument or of some of the elements entering into it, or else it was inaccurately calibrated. I, personally, attribute a great deal of our commercial success to this intermediate checking in the drawing-room, and you can put it down as a settled fact that any manufacturer who produces instruments of any particular type the scales of which for corresponding ranges vary greatly from one another has not yet mastered the proper design or construction of his instrument.

It would be impossible to detail the many different kinds of measurements which can be made with the proper type of voltmeter, ammeter and wattmeter. In general, however, the possession of these three instruments enables one to measure not only voltage, current and power, but likewise capacity, inductance and resistance; and from these various measurements may be obtained data covering the performances of almost any type of generating or translating device.

There are many special forms of indicating instruments designed to indicate directly some of the various measurements most frequently employed, two of which at least, are so universally used at the present time that they deserve at least passing mention. One is a voltmeter designed for use on constant current arc light circuits, capable of indicating directly the total electromotive force of the dynamo, and so connected by means of self-contained switches that not only can the total voltage of the dynamo or circuit be read, but likewise the presence of a ground indicated and its actual value in volts directly determined. This involves an arrangement of connections so that the voltmeter can be connected directly across the terminals of the circuit and then connected successively from the plus and minus side of line to ground. From the three readings thus obtained the number of lamps burning can be directly ascertained, the presence of the ground shown and the ground itself can be absolutely located by a very simple calculation. By employing in addition to this, the known resistance of the instrument, the actual resistance of the ground in ohms may be obtained, thus defining its character.

An instrument of this character was brought out by my company some few years ago, and has met with almost universal favor, due largely to the growing tendency to measure resistances under full working potential. Such an instrument will show grounds which would not be shown by the ordinary galvanometer and bridge method of testing, and further enables the switchboard attendant to locate grounds while the line is in operative condition.

Another instrument, which for a time fell into disuse, but which to-day is being used more extensively than ever, is the differential voltmeter, designed primarily to show the difference in potential between the bus bars and any dynamo which has to be connected to the bus bars in parallel with dynamos already operating. It is rather a curious fact that the average dynamo tender places implicit confidence in the indications of his differential voltmeter. The mere fact that he can see the pointer come back to zero when the free dynamo is being brought up to voltage, and the knowledge that when the pointer does stand at zero he can throw the free dynamo into circuit without danger of trouble, impresses him with the idea that the instrument is essentially reliable and accurate, and he is ready to condemn any or all of his regular switchboard voltmeters which fail to agree with it in indication. This tendency has led my company to devote special attention to the calibration of differential voltmeters and to furnish them with a full scale which indicates the exact voltage of the bus bars, in place of furnishing instruments which give full scale deflections for 10 per cent. or 20 per cent. of the normal voltage.

In closing I would say that I know of no subject connected with electrical engineering which promises such rich rewards for investigation as the subject of electrical measuring instruments, and if my hasty and very general review of the subject will influence anyone to pursue the subject thoroughly and scientifically, I shall feel more than repaid. I have confined practically my entire time and attention to this line for a number of years and find the subject grows more interesting the further I investigate it, and I hope the time is not far distant when the literature of this subject will be as complete and as comprehensive as that now available in allied branches of electrical engineering.

THE HEMINGWAY-COLEY AUTOMATIC REPLACING FUSE.

This fuse, which is the invention of Mr. R. J. Coley, is designed to provide against the extinction of light frequently caused by momentary short-circuit. This is done by providing two fuses, the second of which automatically comes into action when the first has been blown. The assumption is that the interval between the blow of the first fuse and the

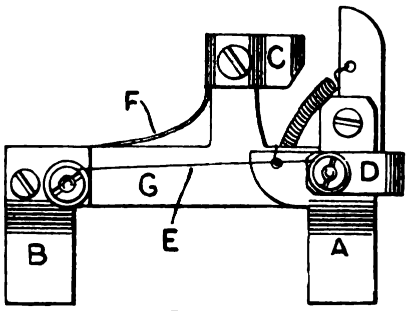

FIG. 1.

switching-in of the next is sufficient under ordinary circumstances for the accidental short-circuit to have ceased to exist. In Fig. 1 the first fuse is in circuit, which connects one fuse block to the movable contact on the right-hand side of the figure. This contact is constrained by a spring, which tends to close the connection to the subsidiary fuse. It is prevented from doing so by the fuse wire, which is in tension. As soon as this fuse wire melts, the revolving contact flies over, and puts the second fuse in circuit. Fig. 2 shows the apparatus as it would be seen after the first fuse has blown. The letters on the diagram mark the following parts: *a* is the subsidiary contact, and *b* is that contact which is common to both

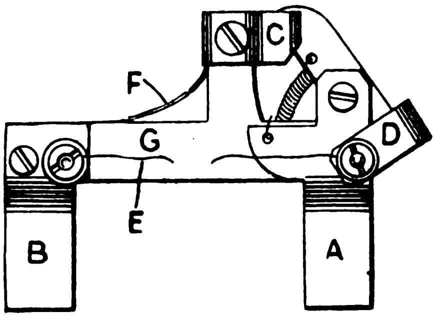

FIG. 2.

fuses. The plate, *c*, carries the other end of the secondary fuse, and connection is made with this by means of the lever work, *b*. The whole of the fuses are mounted on an insulated bar, *g*, the fuses being labeled *e* and *f* respectively. We are informed that these fuses have stood the test of practical work, but there are certain details in the samples which have been sent to us which should be modified before they are manufactured in great quantities.—The "Electrical Engineer," London.

ELECTRICALLY-DRIVEN SHOPS.

BY E. BROOK.

The electrical driving of workshops is a subject that is very rarely touched upon by electricians-in-charge, though their experiences must often by very valuable.

In my own case, I have charge of the electrical department of a large engineering and boiler works in the Midlands. We have an average output of 600 units, four generators driving 25 motors, two electrical cranes, 30 arcs and about 600 16 cp. lamps. When I took my present situation, about 12 months ago, I was given to understand that I must get the plant in a thoroughly reliable condition and place everything on a very sound footing, so that only by something very extraordinary could anything go wrong. I find that engineers want electrical machines to be like engines and boilers, that is, thorough, and so that they will work well on overload, if necessary. Fuses they look upon with no favorable eye, because if every time a motor was started roughly in a boiler shop a fuse were to go you would require a man to stand by the motor. Likewise, employers do not like to be told every time there is a bit of trouble with the motor, "Oh! we must make a larger motor—this is overworked." Every dynamo and motor here is overworked, though we have no trouble with them now: they are submitted to very rough usage and stand it. They start at nearly double load and must be fused for above that amount. I got this result by two means—insulation and thoroughness. I found it was better to sacrifice a little efficiency in the armature to get good insulation.

We had three 6 hp. open type drum-wound motors, that were constantly burning out. The armatures were wound with .104 wire, and the current density was 3,000 amperes per square inch; they were rewound with .092 wire and better insulated. Result, slightly lower efficiency, current density 3,910, nine months' run without any attention.

We have a very large planing machine, worked by a 10 hp. motor, taking (at 110 volts) 80 amperes with the cut, 100 amperes when table is reversing, 150 amperes at point of reverse; the current density in the armature is 3,940 amperes per square inch. This armature was constantly breaking down until I converted it into a gramme wound armature, with the very best results.

A 12 hp. enclosed motor of a very good type was driving a second large planer taking 80 amperes; armature wire $\frac{7}{17}$ S.W.G.; current density 2,320 amperes to the square inch. This motor, after about one hour's run, would get unbearably hot; I had to take it out and put down a 10 hp. open type, wire $\frac{7}{18}$ S.W.G., current density 3,150, and that mended the trouble.

I find that brush rockers on motors are worse than useless, as men and lads will touch the machines, with the result that the brushes are often left in the wrong place. I have them all rigidly fixed in their correct position. Oil covers should be made so that they cannot remain open. Brush carriers would be more useful if made suitable for either gauge or carbon brushes, for use with gauze when the motor has to carry more current than the carbon brushes will allow, without heating the commutator. Motors are compelled to work overloaded at times, and an employer will not hear the tale that he cannot add another straw, so to speak, to his motor. If electricity is ever going to be a complete success for workshop use, it must be thoroughly reliable, and inspire confidence in men who do not understand the theory of electrical machinery, as the buyer is the man that must be most considered.

Each length of armature wire is treated with two coats of shellac varnish and baked; the armatures do not look quite so well as when they are varnished at the finish only, when the blemishes are covered up, and the holes filled with shellac, which, on the first heating of the armature, is thrown off inside the poles.

All our armature cores and field formers are covered with a thin layer of mica laid lengthways round them. The ends of the cores of slotted armatures are often left with only the usual insulation that is used inside the slot, extending to the corners, with the result that armatures soon get earthed. I remedied this fault by stripping the core and placing fiber washers at the ends, slotting the fiber to suit the slots in the core, and rounding the corners of the fiber.

Fuses are set at about 150 per cent. overload, which must look absurd and amazing to the arm-chair electrician. The reason is that the steam, towards mid-day, gets very low, causing the voltage to fall, which means a rise of amperage in all the motors, they having to start and work with a greater current. The proper thing to do would be to shut down some of the motors; but no! things must be kept going and not allowed to break down.

These experiences will show some of the difficult conditions that must be surmounted in workshop practice and a few of the ways of overcoming them.—"Electrical Review," London.

The New Electric Line of the Orleans Railway Company at Paris.

A description of the Orleans Railway Company's line in Paris, which is operated by electricity and is 4 kilometers in length, should prove interesting. There is a sub-station between the Austerlitz Depot and that of the Quai d'Orsay. The line throughout its whole length runs underground. An electrically operated transfer platform 9 meters long connects all the tracks on the Quai d'Orsay. This platform can carry electric locomotives of 50 tons. The amount of power required for these locomotives is 500 kilowatts and the current is supplied through a third rail from three sliding contact shoes, while overhead wires are utilized at the d'Orsay Depot and also for the switches. The power station at Ivry contains two electric generators of 1,000 kilowatts each producing a three-phase current of 5,500 volts pressure and a frequency of 25 alternations per second. These alternators were furnished by Portil Vinay of Paris and the steam engines by Dujardin of Lille. Two sub-stations transform this alternating current into a continuous current of 550 volts for power purposes and of 500 volts for lighting. The arc lamps are connected in series. The incandescent lamps are in 4 shunts supplied by a distribution system of five conductors from equalizing dynamos (boosters). There are two Tudor storage batteries of 1,100 ampere hours, of a capacity sufficient to regulate the load and to take up any sudden changes in the same; they are able to furnish light for several hours in case of a machinery break down. The electric plant was furnished by the French Thomson-Houston Company. The line has been in operation and open to the public for several weeks.

When the Electric Current is Dangerous to Life.

Some very interesting experiments have just been made in Zurich, Switzerland, with the object of ascertaining the precise conditions under which electricity is dangerous to human life. The general impression has been that currents of less than 500 volts could not be fatal, yet a few cases of deaths have been recorded through currents which were as low as 120 volts. Alternating currents of 100 volts have in like manner been regarded as absolutely harmless, yet experience shows that this conclusion is not always correct.

With the object of arriving at definite truth on the vexed question, Prof. Weber, a distinguished Swiss scientist, made several experiments on himself. He first made a test with 30 volts, and found that when he grasped the wires with moistened hands, his arms, wrists and hands were practically paralyzed. It was impossible for him to move a hand, an arm, or even a finger, and the pain in these parts of his body was so acute that he could not endure it for more than ten minutes. He also experienced considerable difficulty in freeing his hands from the wires. His next test was with 50 volts, and the pain in this instance was so acute that he could not endure it for more than two seconds.

Neither was it possible for him to free his hands from the wires; and for the reason that his hands and fingers were so benumbed by paralysis as to be practically lifeless. A similar result was obtained when he made tests with dry hands, but not until the intensity of the currents had reached 90 volts.

The conclusion at which Prof. Weber has arrived is that "there is danger in grasping the conductors of two alternate currents with the hands while in a dry condition whenever the difference between the intensity of the two conductors exceeds 100 volts." At the same time he points out that, while currents of such comparatively low intensity are dangerous, other currents of very high intensity are under different conditions absolutely harmless. In explanation it is said that these strong currents affect so quickly the surface of the body that it is impossible for them to press into the interior and produce physiological changes there.

Another notable discovery was made by Prof. Weber. He knew that many a workman had been killed while handling a conductor in which the current was 115 volts, while engineers had constantly handled a similar current without meeting with any injury, and he determined to find out why the current has proved so fatal in the case of workmen. One reason, he claims, is because engineers, owing to their training, are constantly on their guard against danger from electricity, and, furthermore, while performing such work are isolated from the ground through the soles of their shoes. The workmen on the other hand, sometimes work in their bare feet and sometimes in damp leather shoes, the result being that either through this dampness or through their own bodies a connection is established between them and the earth which necessarily leads to their death.

Prof. Weber's experiments have attracted widespread attention among scientists, and the belief among them is general that our knowledge of electricity is more likely to be increased by practical tests of this kind than in any other way.

Count Zeppelin's Airship.

A cable dispatch to the N. Y. "Sun" says that, commenting upon his experiments in aerial navigation, Count Zeppelin corrects the idea that his machine is intended as a vehicle for ordinary transport. He aims with the vessel to be able to reach spots otherwise unapproachable, to seek undiscovered coasts, to carry dispatches to fleets and armies, and for observation.

For these purposes a navigable balloon is imperative, because if the motor machinery should break down the balloon could float until repaired, while on aerial ships or flying machines it is necessary with ordinary traffic to descend if the machinery is disordered, and all machinery must occasionally become disordered. For his purpose the balloon must travel many days without needing fuel, gas or provisions—must keep a certain pace, even against a moderate wind.

The first experiment on July 2, owing to the jamming of the steering apparatus and the sliding weights, which caused a premature descent, did not finally demonstrate the machine's ability to travel, but it proved of adequate construction in all other essentials.

When alterations are effected a satisfactory speed will probably result. Experiments have proved that the present sized screws are the most suitable. Larger screws would not increase the speed. Greater speed may be attained by more powerful motors, weighing the same as the present ones. This also means the reduction of the vertical diameter of the balloon, which the new metal, magnalium, an alloy of magnesium and aluminum, may render possible.

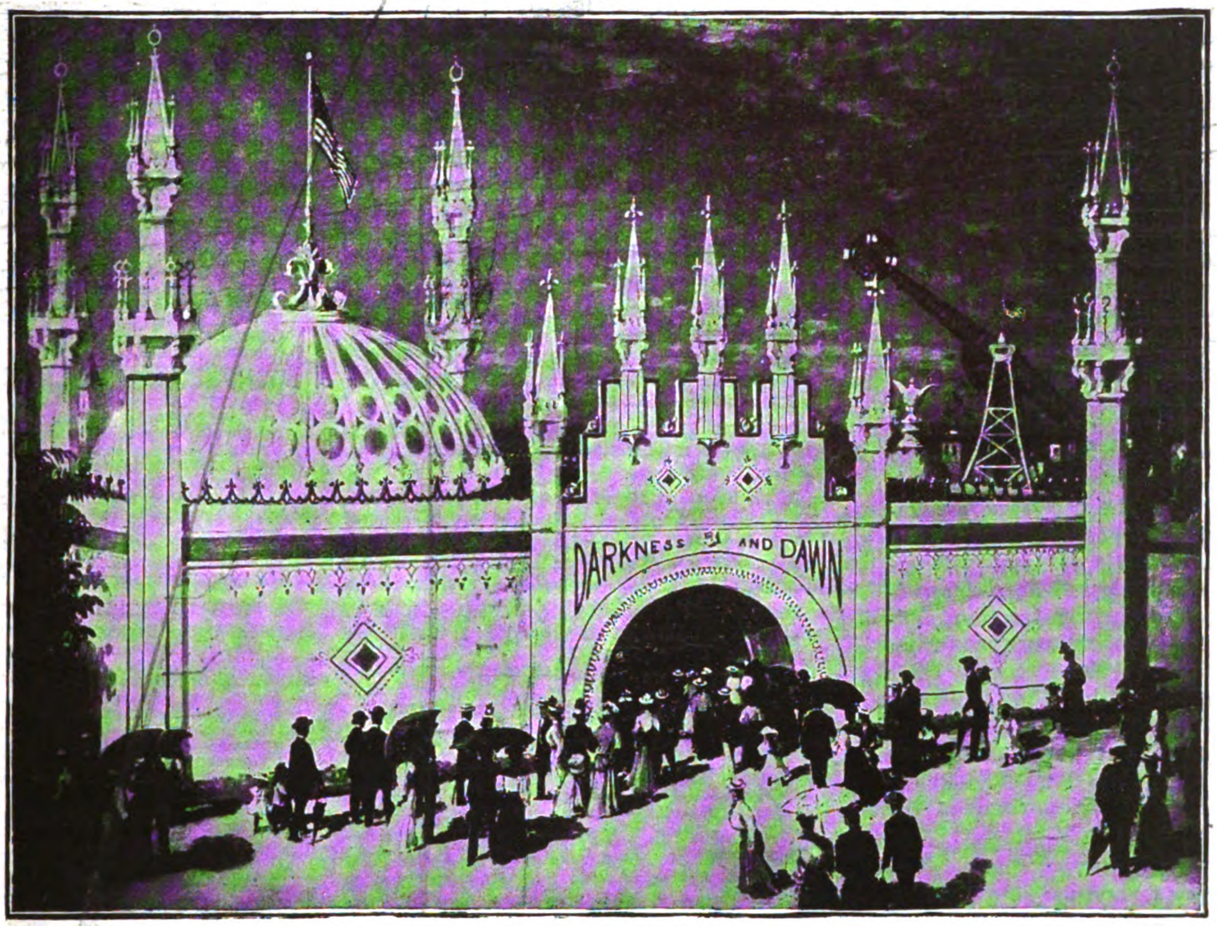
Descents must always be made against the wind with the balloon slanting in that direction. The balloon requires a landing place and shed, as a ship does a harbor and a dock. If she lands elsewhere she can easily be taken to pieces and transported in sections.

The expenditure has not been incommensurate with the object in view. As Count Zeppelin sums it up, if the present machine does not attain the desired speed, it is proved possible to build such a one.

"DARKNESS AND DAWN."

A Wierd and Fascinating Feature of the Midway at the Pan-American Exposition.

"Darkness and Dawn," which is to be one of the features of the Midway at the Pan-American Exposition in Buffalo next year, is a presentation of Dante's Inferno. It is remarkably realistic, with enough of comedy to relieve the gruesomeness that otherwise might jar sensitive natures. The visitor is taken in hand by guides and conducted to an elevator by which he seems to go down, down into hopeless darkness. As he steps from the cage he finds himself in a cool retreat with jovial companions, such as a living skeleton, a widow in her weeds, an undertaker or two. It is the threshold of the place which good people expect to avoid in the hereafter. The visitor, under the protection of guides is assured of safety. He is led through a series of corridors and grottos, along burning lakes and other devices of torture, where he may witness the punishment of those who juggle with the truth, who borrow umbrellas and neglect to return them, who gossip about their neighbors and who otherwise trespass on the rights of others. The lesson is a salutary one. Presently the scenes of purgatory are passed and the visitor comes to the "Grotto of Dawn," where maidens are dancing and singing and wonderful illusions greet the eye. The music and brilliant scenes form a happy ending of the journey. After tarrying a few moments in the grotto the visitor returns once more to the realm of every-day life.



"DARKNESS AND DAWN."—PAN-AMERICAN EXPOSITION.

CANADIAN NOTES.

(From our Ottawa Correspondent.)

An incandescent coal oil lamp is the latest invention brought to the attention of Ottawa capitalists. A company is being formed for the purpose of manufacturing coal oil lamps, according to a model made by Mr. V. L. Emerson, the American scientist, who is now residing at Ottawa. The incandescence is created by blowing a thin stream of coal oil in a spray over a film, which is shaped like the Auer light burner, and the result is claimed to be a light of about twenty times the brilliancy of an ordinary 16 candle-power electric light. It costs only about one-tenth of a cent per hour. To an ordinary student's coal oil lamp, Mr. Emerson has attached a small box into which air is forced by means of a pump, and it is there compressed. The air is connected with the oil chamber, and the air, pressing upon the oil, forces it through a tiny hole in a pipe leading to the burner. This pipe is curved like the letter S, and when the oil escapes from the pipe, it is spray, and is cast over the film where it burns with great brilliancy. One of these lamps has been set up by the inventor and is giving wonderful light. A heating arrangement, on the same basis, is also said to be giving great results.

On July 31 the ratepayers of Brockville, Ont., voted on a by-law to raise $100,000 by debentures for the purchase of the plant of the Brockville Light & Power Company. About

Digitized by Google

one-third of the eligible vote was only cast, and the by-law was carried by a majority of 404 votes. A by-law was also adopted favoring commissioners to manage the works, which will be taken over next October.

The Montreal Street Railway Company has introduced a new style of car on its lines. The car is 41½ feet long. It is closed in and has doors in the middle as well as the front and back. In the middle of this car is a sort of porch, open on one side, and before and behind this porch are two compartments, capable of holding 24 passengers each.

The town of Bracebridge, Ont., has passed a by-law to raise $27,000 by debentures for the purpose of extending the present power, putting in new water wheels and dynamos, etc. It is the intention to proceed with the work at once. Four contracts will be let, one covering excavating and rock work, another the dam and power house, the third, steel flume and water wheels and the fourth electric plant.

LONDON NOTES.

[From our London Correspondent.]

Electric Railroad Plans Wanted for London.

The directors of the Metropolitan and Metropolitan District Railway Companies, who, as announced in ELECTRICITY recently, have laid a short experimental electrical track between Earl's Court and High street, Kensington, have resolved to invite the leading electric traction firms to draw up and submit to them plans, specifications and detailed estimates and tenders for the necessary installation for the working of the complete undertaking by electricity. This contract will undoubtedly excite a great deal of keen competition between English electric traction engineers, and American contractors are sure, from indications, to be well to the fore with their proposals. The course which the companies have now adopted is to appoint a committee of six directors (three from the board of each company) "to consider the question of applying electric traction to the working of the inner circle line."

LEGAL NOTES.

A decision in the case of the Lyons (N. Y.) Electric Light Company against David Bastian and others has recently been handed down by the Appellate Division, Fourth Department, affirming the decision of Referee Smith of Canandaigua, N. Y., from whose judgment it was appealed. This is the action brought by the Electric Light Company against the South Lyons farmers to recover $500 damages for tearing away a portion of their dam on the Canandaigua outlet because it caused the water to overflow upon some of the land adjoining the river which belonged to the aforesaid farmers. The referee decided in favor of the plaintiff and the Appellate Division sustains this judgment. The case will probably be taken to the Court of Appeals.

Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended August 3:

Antwerp, 79 packages, $4,026; Argentine Republic, 3 cases automobile parts, $200; 145 packages, $5,672; 21 cases motors, $2,742; Australia, 61 cases $2,901; 38 packages, $3,500; Barcelona, 8 cases, $216; Brazil, 42 packages, $3,054; Bremen, 2 cases $160; British East Indies, 91 packages, $3,054; British West Indies, 4 cases, $79; Brussels, 3 packages, $11; Central America, 13 packages, $375; Cuba, 24 packages, $299; Ecuador, 18 packages, $270; Genoa, 7 cases, $625; Glasgow, 45 packages, $3,100; Hamburg, 41 packages, $3,850; Havre, 90 packages, $12,841; Liverpool, 114 packages, $2,241; 138 trolley poles, $4,897; London, 111 cases, $8,644; Lyons, 14 cases motors and parts, $2,750; Manchester, 28 packages, $1,724; 1 case, $10; Marseilles, 85 packages motor trucks, $4,750; Mexico, 22 cases, $193; 97 packages, $12,975; Naples, 49 packages, $11,296; Newcastle, 7 packages, $875; Nova Scotia, 25 packages, $238; Peru, 6 cases, $154; Southampton, 9 cases, $389; 4 packages, $207; St. Petersburg, 1 case, $15; U. S. Colombia, 26 packages, $904; Venezuela, 106 packages, $901.

PERSONAL MENTION.

Mr. John I. Sabin, president of the Pacific States Telephone & Telegraph Company, San Francisco, Cal., is at work on the preliminary details of establishing in Portland, Ore., the executive headquarters of the consolidated telephone companies.

INCORPORATIONS.

The Standard Electric Company- Trenton, N. J.—to deal in all business pertaining to electrical construction. Capital stock, $25,000. Incorporators: James W. Sawyer, Benjamin L. Cotes and Francis C. Lowthorp.

The Darlington Electric Fountain & Display Company. Camden, N. J.—to manufacture and sell electric supplies. Capital stock, $100,000.

The Globe Electrical Manufacturing Company, Philadelphia, Pa.—to manufacture and deal in electrical supplies. Capital stock, $250,000. Incorporators: G. E. Cooling, A. G. Coolidge, W. Mason, W. L. Tater and D. R. Paterson, all of Philadelphia.

The Keokuk Electric Railway & Power Company, Keokuk, Ia. Capital stock, $400,000. Incorporator: J. C. Hubinger of Keokuk.

ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U. S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

LETTERS PATENT ISSUED JULY 31, 1900.

ELECTRIC RAILWAYS AND APPLIANCES.

654,586. Conduit Electric-Railway System. Frank M. Ashley, New York City, assignor to the General Electric Company of New York. Filed Feb. 26, 1898.

654,632. Gear for Motor-Cars. Jean J. Heilmann, Paris, France. Filed Dec. 19, 1899.

654,658. Electric Railway. Gustav A. Lyncker, Munich, Germany. Filed April 23, 1900.

654,803. Trolley-Wheel. Stephen G. Reynolds, Easton, Pa., assignor of one-half to Nat Freeman, same place. Filed Dec. 11, 1899.

654,854. Car-Fender. George D. Smith, Paterson, N. J. Filed March 30, 1900.

655,014. Trolley. Felix J. Rogers, Crafton, Pa. Filed Jan. 3, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

654,679. Electric-Arc Lamp. Carl Schuster, Pittsburg, Pa., assignor to Pittsburg Electrical & Machine Works, same place. Filed June 13, 1899.

654,821. Flash-Light System. Martin Wright, San Antonio, Tex. Filed April 28, 1900.

654,923. Lamp-Post. George D. Scott, Birmingham, Ala., assignor to the Kitson Hydrocarbon Heating & Incandescent Lighting Company, Philadelphia, Pa, Filed March 26, 1900.

655,041. Light Especially Adapted for Electric Headlights for Locomotives. William H. Young and Stephen A. Hayes, Sanford, Fla. Filed March 14, 1900.

655,063. Electric-Arc Lamp. James E. Davidson, Butte, Mont. Filed Oct. 17, 1899.

ELECTRICAL MACHINERY AND APPARATUS.

654,583. Machine for Winding and Insulating Electric Coils. James C. Anderson, Jersey City, N. J. Filed Feb. 7, 1900.

654,595. Method of Operating Dynamo-Electric Machines. Ernst J. Berg, Schenectady, N.Y., assignor to the General Electric Company of New York. Filed May 26, 1900.

654,663. Electric Regulating Device. Walter S. Moody, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed May 21, 1900.

654,698. Electrical Igniter for Hydrocarbon-Engines. Hugo Wegelin, Augsburg, Germany. Filed Feb. 16, 1899.

654,700. Electric Controller. William Asbury, New York City. Filed Dec. 1, 1899.

654,734. Electric-Commutator Cleaner. August H. Jahn, Homestead, Pa Filed Nov. 23, 1899.

654,752. Speed-Governor Attachment for Electrical Apparatus. James H. McGurty, Jersey City, N. J., assignor of forty-nine one-hundredths to Thomas McEwan, Jr., same place. Filed April 25, 1900.

654,847. Automatic Circuit-Breaker. William M. Scott, Philadelphia, Pa., assignor to the Cutter Electrical & Manufacturing Company of New Jersey. Filed Nov. 1, 1897.

654,848. Automatic Magnetic Circuit Breaker. William M. Scott, Philadelphia, Pa., assignor to the Cutter Electrical & Manufacturing Company of New Jersey. Filed Jan. 5, 1898.

654,883. Motor-Controller. William R. Elliott and John W. Eskholme, Westfield, N. J., assignors to the C. & C. Electric Company of New Jersey. Filed April 2, 1900.

654,999. Electric Motor. Walter S. Moody, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed May 7, 1898.

655,047. Quick Break Electric Switch. William F. Bossert, Utica, N. Y., assignor to the Bossert Electric Construction Company, same place. Filed March 10, 1899.

TELEPHONES AND TELEPHONE APPARATUS.

654,747. Supervisory Signal for Telephone-Switchboards. Frank R. McBerty, Downer's Grove, Ill., assignor to the Western Electric Company, Chicago, Ill. Filed Nov. 13, 1897.

654,748. Telephone Toll Apparatus. Frank R. McBerty, Downer's Grove, Ill., assignor to the Western Electric Company, Chicago, Ill. Filed Nov. 13, 1897.

654,749. Signal Appliance for Telephone-Switchboards. Frank R. McBerty, Downer's Grove, and James L. McQuarrie, Chicago, Ill., assignors to the Western Electric Company, Chicago, Ill. Filed Nov. 22, 1897.

654,750. Switchboard for Telephone-Lines. Frank R. McBerty, Evanston, Ill., assignor to the Western Electric Company, Chicago, Ill Filed Dec. 26, 1899.

654,758. Apparatus for Telephone-Switchboards. Joseph J. O'Connell, Chicago, Ill., assignor to the Western Electric Company, same place. Filed May 12, 1899.

654,924. Switchboard for Telephone Lines. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 26, 1899.

655,113. Electromagnetic Telephone. Andrew Plecher, Savannah, Ga. Filed Feb. 16, 1900.

655,164. Connection-Counter for Telephone-Lines. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 13, 1897.

SIGNALS AND SIGNALING APPARATUS.

654,625. Signaling Device. John L. Hall, Schenectady, N.Y., assignor to the General Electric Company of New York. Filed May 10, 1900.

654,967. Electric Signal and Fire-Alarm. David Geywits, Rome, and William Still, Utica, N.Y., assignors to Michael H. Powers, Rome, N.Y. Filed Feb. 16, 1900.

655,144. Electric-Signal-Registering System. Otto P. Yurgae and Robert H. Yurgae, Milwaukee, Wis., assignors, by direct and mesne assignments, to the Yurgae Signalphone Manufacturing Company, same place Filed May 14, 1900.

MISCELLANEOUS.

654,630. Radiophony. Hammond V. Hayes and Ernest R. Cram, Cambridge, Mass., assignors to the American Bell Telephone Company, Boston, Mass. Filed June 7, 1897.

654,656. Elevator-Controller. Nils O. Lindstrom and Allan Cowperthwait, New York City, assignors to A. B. See Manufacturing Company. Filed April 11, 1900.

654,703. Means for Connecting Cables. Nathan Bassett, Philadelphia, Pa., assignor to the Globe Telephone Manufacturing Company, same place. Filed Dec. 30, 1899.

654,742. Automobile Truck. Hosea W. Libbey, Boston, Mass. Filed Oct. 18, 1899.

654,816. Electrical Transmission of Power. Imle E. Storey, Trenton, N. J. Filed Nov. 18, 1899.

654,834. Secret Telegraph-Sounder. George H. Landgraf, Waterloo, Wis. Filed June 21, 1898.

654,851. Semaphore-Operating Mechanism. Judson Shoecraft, Eskridge, Kan., assignor to Charles C. Gardiner, Bradford, Kan. Filed Oct. 10, 1899.

654,871. Electric Cable. John Y. Buchanan, Edinburgh, Scotland. Filed May 18, 1900.

654,903. Power Transmission. Allen Loomis, Jackson, Mich. Filed Sept. 29, 1899.

654,937. Phonograph Attachment. Joseph N. Blackman, East Orange, N. J. Filed March 26, 1900.

654,951. Process of Manufacturing Composition Applicable for Electric Insulation, William J. Cordner, London, England, assignor to Louis D. Brandeis, trustee, Boston, Mass. Filed Oct. 17, 1899.

654,952. Composite Material Applicable for Electric Insulation. William J. Cordner, London, England, assignor to Louis D. Brandeis, trustee, Boston, Mass. Original application filed Oct. 17, 1899. Divided and this application filed Feb. 6, 1900.

655,006. Electric Lock. Theodore P. Pratt, Boston, Mass., assignor to Fred Warren Clark, same place. Filed April 21, 1900.

655,032. Rectifying Alternating Currents. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed March 28, 1900.

655,057. Thermostat and Alarm Circuit Controlled Thereby. Henry G. Carleton, New York City, assignor to the Carleton Electric Company, same place. Filed Sept. 8, 1899.

655,111. Electrolytic Apparatus. Andrew Plecher, Savannah, Ga. Filed Jan. 20, 1900.

DESIGNS.

33,036. Electric Lamp Holder. William Roche, Jersey City, N. J. Filed June 27, 1900. Term of patent 7 years.

33,043. Automobile-Frame, George T. Turner, Philadelphia, Pa. Filed May 16, 1900. Term of patent 14 years.

THE TELEPHONE WORLD.

One Way Adopted by the Bell Monopoly to Crush the Independent Movement.

The Central Union Telephone Company, a Bell organization, has begun suit in the Circuit Court of the United States for the Northern District of Ohio, Western Division, against the Bryan Telephone Company, an independent organization doing business in the town of Bryan, O. The remarkable part of this litigation is the ground on which the suit was brought by the Bell concern, and which is clearly set forth in the following letters and civil action petition:

THE INDEPENDENT TELEPHONE ASSOCIATION OF THE UNITED STATES OF AMERICA,
CLEVELAND, O., July 28, 1900.

ELECTRICITY PUBLISHING COMPANY, New York.

Gentlemen: Enclosed I send you copy of petitions and correspondence in suit of the Central Union Telephone Company against the Bryan Telephone Company of Bryan, Ohio, which will no doubt be of interest to your readers.

The Independent Telephone Association, as you will see from the correspondence, now has charge of this litigation. We feel that the facts surrounding this suit gurantee this provision, as it is only the result of feeling growing out of strong opposition.

The agents of the Bryan Telephone Company in this case were acting as the agents of persons desiring the removal of the Central Union telephones from their premises; at the request of persons desiring to dispense with the Central Union service, after refusal on the part of that company remove their instruments.

Thinking that this would be of interest to you, I voluntarily send it for your use if you so desire. Yours very truly,

(Signed) JAMES M. THOMAS,
President.

CLEVELAND, O., July 20, 1900.

Will W. Morrison, Bryan, Ohio.

Dear Sir: I have just noticed in the Bryan "Press," under date of July 19, that suit has been brought by the Central Union Telephone Company against the Bryan Telephone Company to the United States Court at Toledo, asking $10,000 damages alleged to have resulted to the Central Union Telephone Company by reason of opposition of your company; further alleging that you have damaged them in other cities in Ohio, Indiana and Illinois.

You deserve the backing of other independent telephone interests throughout the country, as all are very busy building up business at reasonable prices, in opposition to the old telephone companies who have sought to unduly prolong a monoply.

Therefore, as President of the Independent Telephone Association of the United States of America, in behalf of the Association, I hereby tender you any assistance that you may desire or will accept in defending yourself against this most absurd and ridiculous charge.

Please let me know if you desire the Association to take part in this litigation, and if so we will have our attorneys take the matter up at once. Yours very truly,

(Signed) JAMES M. THOMAS,
President.

BRYAN, Ohio, July 21, 1900.

James M. Thomas, President Independent Telephone Association U. S. A., Cleveland, O.

Dear Sir: Replying to your favor of July 20, I have to say that I am authorized to accept the offer of assistance from the Independent Telephone Association of the United States in defending ourselves against the action brought against us by the Central Union Telephone Company.

We feel that we deserve the support of the independent companies as we have done nothing more than every company is doing in its fight against the Bell monopoly, and should that company be able to recover damages it would simply mean that we could be prevented from soliciting subscribers from our competitors.

This action appears to be a new method on the part of the Bell Company of harassing and embarrassing the independent companies. Respectfully yours,

(Signed) WILL W. MORRISON,
President.

CIVIL ACTION PETITION.

In the Circuit Court of the United States for the Northern District of Ohio, Western Division.

Central Union Telephone Company (a corporation) plaintiff vs. the Bryan Telephone Company (a corporation) William W. Morrison, and Ira E. Gardner, defendants.

To the Honorable Judges of said Court:

The Central Union Telephone Company, a corporation and a citizen of the State of Illinois, brings this, its bill against the Bryan Telephone Company, a corporation and a citizen of the State of Ohio, and William W. Morrison, and Ira E. Gardner, all of Bryan, Ohio, and citizens of the State of Ohio, and residents and inhabitants of said district.

Thereupon your orator complains and says that plaintiff herein is a corporation duly organized under and pursuant to the laws of the State of Illinois, owning and operating telephone lines and exchanges throughout the States of Illinois, Indiana and Ohio, and in and through the County of Williams, and State of Ohio; also in and through the village of Bryan in said county, and through said lines and exchanges having and operating telephonic connection and communication for its subscribers throughout its entire system and with other systems of telephone service distributed over a large number of other States within the United States of America.

That said defendant, the Bryan Telephone Company, is a corporation duly organized under and pursuant to the laws of the State of Ohio, and owning and operating lines of telephone and telephone exchanges in said village of Bryan, County of Williams and State of Ohio; that said defendant, William W. Morrison, and Ira E. Gardner are large owners of stock in said Bryan Telephone Company, and are also officers and agents of and for said Bryan Telephone Company.

Your orator says that it has been established and maintained and is still maintaining, at great expense an exchange for telephone service, together with lines of wire, poles and other necessary fixtures for operating the same, within said village and county, and that said telephone exchange and lines are connected with and form a part of its system of telephone service and communication, as hereinbefore set forth, and through its said exchange and lines within the village of Bryan, County of Williams and State of Ohio, it is furnishing telephone communication, and service to a large number of subscribers within said village and county, and that said telephone communication and service is maintained by this plaintiff for the benefit of its said subscribers within said village and county; also to make possible telephonic communication with said subscribers and its numerous other subscribers at its other exchanges and connections throughout its entire system, and that the value of its said system depends largely on the maintenance of such connection and communication with all subscribers at all and each of the exchanges connected with, and forming a part of said system.

Your orator says that at sundry times during the month of June, 1900, and before and since, said defendant, the Bryan Telephone Company, through its said officers and agents, and through other of its employes, called upon a large number of plaintiff's subscribers in the village of Bryan, and by persuasion, misrepresentation, threat and intimidation induced a large number of said subscribers to sign a printed form of notice to plaintiff to discontinue its telephene service to said subscribers, and did forcible, wrongfully and unlawfully interfere with the property of plaintiff, to wit, its telephones, wires and other fixtures connecting said telephone with plaintiff's exchange in said village, and said defendants through their employes did disconnect said telephones, break and cut said wires, and remove the same from their proper position and fastenings, thereby injuring and destroying said property belonging to the plaintiff, and cutting off plaintiff's communication with its said subscribers, so that plaintiff was and still is unable to furnish telephone service between said subscribers and all other subscribers connected with plaintiff's said exchange, both within said village of Bryan and plaintiff's other numerous exchanges located and operated in the various cities, towns and villages of said States of Ohio, Indiana and Illinois, and also with other parts of its connecting lines extending over and through the territory hereinbefore described.

Your orator says that the threats and intimidations hereinbefore referred to consisted in defendants threatening many of said subscribers that unless said subscribers should discontinue the service of plaintiff and use that only of defendant, the Bryan Telephone Company, said defendants would use their influence to injure and ruin the business of said subscribers; and that said subscribers fearing and believing that said defendants would do as they had threatened to do, did discontinue the service of this plaintiff, to plaintiff's great damage.

Your orator further says that said defendants have induced many of plantiff's subscribers to form combinations and agreements against the use of plaintiff's said service, to the great annoyance and interference with plaintiff's business, and to plaintiff's great damage, and that said defendants have also wrongfully and unlawfully threatened to do injury to the private business of many of said subscribers, unless said subscribers should discontinue the service of this plaintiff, and by uch wrongful and unlawful threats, said defendants have induced and caused a great many of plaintiff's said subscribers to discontinue said service, thereby greatly impairing the service furnished by plaintiff to its numerous other subscribers, and to and with the general public.

Your orator further says that said defendants, by said wrongful and unlawful acts, have done great injury to plaintiff's property, and have seriously impaired and greatly injured plaintiff's business and service within said village of Bryan, and elsewhere throughout plaintiff's system, all to plaintiff's great damage in sum of ten thousand ($10,000.00) dollars.

Wherefore your orator prays the court for judgment against said defendants in the said sum of ten thousand ($10,000.00) dollars.

TOUVELLE, MASTERS & ADAMS,
Attorneys for plaintiff.

According to recent news received from Kansas City, Mo. the telephone will supersede the telegraph to a great extent on the Santa Fe system. The company now has in operation on its Chicago, eastern and middle divisions a private telephone system connecting a large number of the block signal stations, and the passage of trains in and out of the various blocks now is scheduled from operator to operator by telephone instead of telegraph as heretofore. However, the management of the road believes in the telephone as a means of communication in railroad work only to a limited extent. Simultaneous with the establishment of the system an order was issued prohibiting absolutely the use of the telephone for the transmission of train orders. The question of substituting the telephone for the telegraph in railroad work is one that now is being earnestly considered by railway managers. The Pennsylvania officials have gone so far as to supersede the telegraph on a portion of the system with the telephone and the experiment is said to be a success. It is believed by some managers that the danger of mistakes can be greatly lessened by the use of the telephone. The only difficulty to be considered in the matter is the frequency with which the average telephone gets "out of order." If interest in the telephone as a successor to the telegraph continues the Santa Fe probably will decide upon a more extended test.

News from Minneapolis, Minn., states that a million dollars has recently been added to the capital of the Mississippi Valley Telephone Company for enlargement purposes. Chicago and St. Paul capitalists have, it is understood, subscribed the new capital. A sub-exchange is to be established in the Midway district soon. A franchise has also been secured for the opening of an exchange in South St. Paul, and through this a number of cities will be added to the list of those already reached by the long-distance wires of the company.

The work on the Cumberland Telephone line between Waverly and Linden, Tenn., is being pushed rapidly. All the material is now on the ground and the line is in working order as far as Bakerville. The line when completed will have a double circuit and will touch every point of importance in Humphreys and Perry Counties. The line will be completed by Sept. 1.

Manager Porter of the Inland Telephone Company, with headquarters in Baker City, Ore., visited the Baisley-Elkhorn mine a short time ago to make arrangements to connect that mine and others on Elkhorn Mountain with the through line from Baker City. Telephone connection between the Baisley-Elkhorn mine and Baker City will be a great advantage to both the mine and that city.

A stock company of local business men has lately been incorporated under the laws of the State of Wisconsin, and will put in a local telephone exchange at Baldwin, using the National Automatic system. The system will be in working order in three months.

The Carroll County Telephone Company, with headquarters at Huntingdon, Tenn., is extending its lines and now has connection with Decaturville. It will soon connect with Dresden and Weakley County.

TELEPHONE INCORPORATIONS.

The Wisconsin River Telephone Company, Stevens' Point, Wis.—to operate a local exchange in connection with the Wolf River toll line. Capital stock, $25,000. Incorporators: F. L. Dille and John Reton, Stevens' Point, and A. L. Hutchinson, Weyauwega.

The Long Distance Telephone Company, Staunton, Va.,—to operate a telephone line. Capital stock, $100,000. Incorporators: J. R. Kemper, W. H. Laughlin, F. M. Hanger, N. C. Watts, A. Bowling, E. Echols, all of Staunton; J. S. Cochran of Folley Mills and J. F. Clemmur of Middlebrook.

The Hampton Telephone Company, Hampton, Va. Capital stock, $25,000. Incorporators: W. E. Lawson, H. W. Saunders, both of Hampton.

The Northern New York Telephone & Telegraph Company, Chicago, Ill. Capital stock, $200,000. Incorporators: A. E. Stilwell, G. E. Milligan, D. S. Lander, S. B. Willey, M. Hubbert, all of Chicago.

The Liter Arcadia Telephone Company, Arcadia, Ill. Capital stock, $1,500. Incorporators: B. F. Henderson, D. E. Kennedy and L. A. Barr.

GENERAL NEWS.

What is Going On in the Electrical World.

LIGHTING.

Aberdeen, S. D.—Fire totally destroyed the gas and electric light plant at this place last week, involving a heavy loss; partially insured.

Albany, N. Y.—A certificate was lately filed here to the effect that the Queens Electric Light & Power Company has merged with the Electric Illuminating & Power Company of Long Island City, Jamaica Electric Light Company, and the New York and Queens Gas & Electric Company.

Altona, Ill.—According to the statement of the managers, the electric light plant at this place which burned down recently is to be running again in sixty days.

Asheville, N. C.—The W. T. Weaver Company of this place recently secured a charter and will establish an electric power plant on the French Broad River near here, for the purpose of supplying power for factories, electric light, etc., with $30,000 capital stock.

Batesville, Ark.—The demand for electric lights has grown to such an extent during the year and a half the plant has been in operation here, that the city is compelled to enlarge its capacity.

Birmingham, Ala.—The light committee is considering the question of erecting a municipal electric light plant.

Carlyle, Ill.—The prospects for the early establishment of an electric light plant here are quite favorable.

Cass Lake, Minn.—This place is to have electric lights and waterworks.

Cato, N. Y.—The question of erecting an electric light plant at this place is being considered.

Chambersburg, Pa.—The voters of this place have decided to issue $13,000 bonds for improving the town's electric light plant.

Cleburne, Tex.—The city council recently granted a franchise to Emmet Ellis of Dallas to put in an electric light plant and steam heating apparatus.

Dayton, O.—The National Cash Register Company is preparing plans for a complete new electric light plant at its works. E. A. Deeds, electrical engineer.

Dothan, Ala.—Bids will be received in about 30 days for erecting a municipal electric light plant to operate twenty-five 1,200 c.p. arc and 1,000 16 c.p. incandescent lights to cost $10,000.

Dublin, Ga.—This city contemplates increasing the capacity of its electric light plant. T. D. Smith, clerk.

Evansville, Ind.—The waterworks board has rejected all bids received for erecting an electric light plant at the new waterworks station, and will readvertise the work.

Evergreen, Ala.—This city will build a $25,000 electric light plant and waterworks. T. D. Jackson, city clerk.

Galesburg, Ill.—This city is figuring on putting in an electric light plant of its own, and L. E. Myers of the Peoria & Pekin Terminal Company is among the bidders.

Heyworth, Ill.—The people here expect to have an electric light plant soon.

Horseheads, N. Y.—The taxpayers of this village will decide whether the corporation will have electric lights early this month. Two propositions will be submitted. One is, whether the village shall construct a plant at a cost not to exceed $20,900; the other is whether the budget shall be increased in order to allow the trustees sufficient funds to procure light from the Elmira Illuminating Company.

Hot Springs, Ark.—The Hot Springs Street Railway Company has decided to erect a complete electric light and power house in this city to furnish power to operate its system and supply light for commercial purposes.

Jackson, La.—Bids are asked by the board of administration of the State Insane Asylum for erecting an electric light plant. Dr. G. A. B. Hays, superintendent.

Kenton, O.—Kenton is to have a new electric light plant, a number of leading citizens having become incorporated for that purpose with a capital stock of $20,000.

Mansfield, O.—The city council is considering the question of erecting an electric light plant.

Mazo Manie, Wis.—It has been decided by the village board to rebuild the electric light plant recently destroyed by lightning.

New Albany, Ind.—An ordinance was recently introduced in the council granting to the New Albany City Water & Light Company a franchise for the construction and operation of an electric light plant.

Newport News, Va.—By the first day of January, 1901, the citizens of this place will, it is expected, be using electric lights supplied from a new plant not now even in existence.

North Brookfield, Mass.—T. C. Perkins of Hartford, Conn., is interested in the possibility of getting a system of electric lighting installed in this town. It is understood that the company he represents is to ask for a franchise soon.

Portland, Mich.—Prof. Jones is preparing plans and specifications for an electric light plant at this place.

Prattville, Ala.—This town contemplates erecting an electric light plant.

Shakopee, Minn.—Bids for an electric light plant are desired.

Shawano, Wis.—The citizens will on August 24 vote upon an ordinance authorising the putting in of a combined electric light and waterworks plant.

South Boston, Va.—J. A. Mebane, electrical engineer of the Electric Light and Power Company of this place, wants bids on 500 kilowatt capacity generator for power plant; also 600 horse power in water wheels.

Spencer, Ia.—The electric light plant here is to be enlarged.

Syracuse, Ind.—Syracuse has contracted for an electric light plant.

Toledo, O.—A new electric light plant will be installed at an approximate cost of $10,000 in the Toledo State Hospital. Governor Nash has approved the plans drawn by Prof. Thomas of the Ohio State University for the improvement. Bids for same will be received until August 27. Address H. A. Tobey, Superintendent Toledo State Hospital, Toledo, Ohio.

Watertown, N. Y.—A contract to build a village was let in this city last Wednesday. The contracting parties were the St. Regis Paper Company and Sandford Peters, a builder of this city. The village is to be called Eggleston, and will be lighted by electricity.

STREET RAILWAYS.

Alden, Ia.—An effort is being made to construct an electric railway from here to Britt, a distance of 40 miles, in the near future. L. Soule of Chicago, and Judge Porter recently made a proposition to that effect.

Allegheny, Pa.—A charter was granted to the Northeastern Street Railway Company to build an electric railway 4 miles long in this city. The capital is $24,000. Ed. J. McIllvain is president of the concern.

Augusta, Me.—A concern is about to be formed which will be known as the Lewiston, Winthrop & Augusta Street Railway Company and the petition asks for the construction of a line running through Augusta, Manchester, Winthrop, Monmouth and Wales, to the terminus of the Lewiston, Brunswick & Bath Street Railway at the town of Webster, making a total length of about 27 miles of railway. The capital stock of the company is $160,000. H. M. Heath of this city is interested.

Boughtonville, O.—An electric line connecting Norwalk, Fairfield, this place and Chicago Junction is now being talked of.

Brazil, Ind.—A movement is on foot for the construction of an electric line between this city and Diamond, Parke County, touching Benwood, Cardonia, Carbon, Perth and a number of coal mines on the line.

Bridgeport, O.—The Bridgeport & Cadiz Interurban Railroad Company will operate an electric railway from this place to Cadiz via Mt. Pleasant, Dillonvale, Harrisville and St. Clairsville, on a capital of $10,000. This concern was incorporated by Charles H. Taney, A. B. Butler, W. W. Meek, C. A. White and Ernest T. Finley.

Brooklyn, N. Y.—The Brooklyn Rapid Transit Company which acquired the Old Sea View Elevated structure some two years ago, intends constructing in place of the old line a surface trolley road from West Brighton to Brighton Beach. The distance is about one and one-eighth mile.

Grass Lake, Mich.—The Power Company of Allegan will shortly ask the city council here for a franchise for an electric road through this village.

Jacksonville, Fla.—A proposition to build an electric line in this city has been made by W. B. Owen and others.

Morristown, N. J.—A movement is on foot here for the introduction of a trolley line running from Chatham through Whippany, Hanover and this place, and thence to Dover.

Nescopeck, Pa.—A trolley line which will connect Riverside, Danville, Bloomsburg, Espy, Lime Ridge, Berwick and this place will soon be constructed.

New Philadelphia, O.—The county commissioners have granted a franchise for an electric railway from here to Strasburg over the Wooster road. This will be a link between an electric line to connect Cleveland and Wheeling via Cadiz, Dennison and Uhrichsville, New Philadelphia and Akron.

Pass Christian, Miss.—Chicago capitalists will take hold of the Mississippi project and build an electric line between this place and Biloxi.

Rensselaer, Ind.—There is said to be a movement on foot to run an electric railroad from Paxton to this place, passing through Cissna Park, Milford, Sheldon and Brook.

Selma, Ala.—H. M. Abbott and associates recently purchased the franchise together with all the property of the Selma Street and Suburban Railroad Company, and intend equipping the line with electricity at an early date.

Seymour, Ind.—Daniel Lesley and A. W. Moon, of Indianapolis, have secured a franchise for an electric line at this place.

Tower City, Pa.—A project is on foot to connect with trolley the Schuylkill County towns of Orwin, Reiner City, Donaldson, Tremont, Newtown, Swatara, Minersville and this city.

Utica, N. Y.—It now looks as though the proposed electric railway between Little Falls and this city would be a sure thing. Thomas O'Shea of New York City is one of the promoters.

MANUFACTURING.

Cincinnati, O.—A new plant for the manufacture of electric motors has been started here, and will be in operation within two or three months. The concern is the Cincinnati Electric Motor Company, and it will shortly be incorporated with a capital of $100,000.

New Haven, Conn.—The Franklin Electric Manufacturing Company of this city has recently filed in the State Secretary's office a certificate of organization. Among those interested are Jonathan Camp and John Waring of Hartford, and Charles E. Hills of Elizabeth, N. J.

New York City.—The Bullock Electric Manufacturing Company is beginning to make shipments on the $500,000 contract lately made with a French syndicate for electrical equipment for street railways in different parts of the Eastern Hemisphere.

COMPANY MATTERS.

Milwaukee, Wis.—The Johnson Electric Service Company was recently reincorporated with a capital of $800,000. The main reason for the enlargement of the capital was to consolidate the various branches of the business in the eastern and middle States, which are being run independently of each other, manufacturing the Johnson patented articles in the electric and pneumatic lines. These, it is understood, will all be gathered in and owned by one corporation and controlled from the Milwaukee headquarters.

POWER AND TRANSMISSION PLANTS.

Redlands, Cal.—The California Power Company was lately incorporated to construct a plant upon the Kern River and to furnish electric light and power for Los Angeles and other cities in Los Angeles, San Bernardino, Riverside, Orange and Kern Counties. Henry Fisher, H. H. Sinclair, George B. Ellis, Frank P. Morrison and B. O. Johnson are the directors for the first year. The company's capitalization is placed at $2,500,000, of which $601,000 is subscribed.

Rock Island, Ill.—The stockholders of the People's Power Company are about to increase the capital stock from $300,000 to $600,000. The company owns the gas and electric plants of Rock Island and Moline and furnishes electric power to consumers. The plants are to be enlarged.

Rutland, Vt.—Articles of association have recently been filed with City Clerk H. B. Whittier for the Chittenden Power Company with a capital stock of $50,000. The purpose of the corporation is to develop, construct and operate power plants; to produce, transmit and sell power, light and heat of electricity or otherwise, and to buy and sell lumber and wood.

San Francisco, Cal.—The Fort Miller Power Company was recently formed with a capital stock of $1,000,000 for the purpose of generating and transmitting electrical power. Among those interested are W. Saunders, A. J. Morganstein, T. O. Carter, K. D. McCann and F. G. Berry.

St. Louis, Mo.—At a recent meeting of the stockholders of the Laclede Power Company it was voted to increase the capital stock to $800,000. The company will erect its own power plant.

MINES.

Dravosburg, Pa.—The Monongahela Consolidated Coal & Coke Company is preparing to put in one of the most recent improved electric haulage systems to supply power for all the mines in the neighborhood of Dravosburg, Camden and Street's Run. The plant will be located, it is said, in Buttermilk Hollow. Mifflin township.

Pittsburg, Pa.—The Lake Shore coal mine, an independent concern, is installing electric power to operate its mine to cost $15,000. Power had previously been furnished by the Pittsburg Coal Company, but when C. H. Wisser, the owner, refused to sell or enter the combination, the power was shut off.

AUTOMOBILES.

Bristol, Conn.—J. T. Case is at the head of a movement to establish a company here to manufacture automobiles, having patented a new style of rotary engine at which he has been at work for the past nine years.

Faribault, Minn.—A company of Eastern capitalists has rented the shoe factory building here, and will manufacture automobiles.

Newark, N. J.—The Spurr Automobile Company had its articles of incorporation recorded with the county clerk recently. It will manufacture steam, gasoline and electric vehicles. The capital stock is $100,000. Charles W. Spurr, Jr., Frederick W. Barker and Cyrus P. Baker, Jr., are all interested. The company will have an office at 480 New Jersey Railroad avenue.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16¼@16⅜c.; Lake, 16⅜@16½c.; casting, 16@16⅛c.

The Chicago Union Traction Company's earnings in July were $630,892, a decrease of $22,918.

The report that Mr. J. B. McCall would resign the presidency of the Philadelphia Electric Company is denied.

Advices from Columbus, O., state that the Germantown Traction Company has increased its capital from $10,000 to $150,000, and the Cincinnati Street Railroad from $18,000,000 to $20,000,000.

President Vreeland of the Metropolitan Street Railway Company of New York says that the extension of the service over the Third Avenue tracks to Fort George had not affected the receipts of the latter road to any appreciable extent.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 16@18; New York Electric Vehicle Transportation, 7@8; New England Transportation, 4@4½; Gramophone, 35@40.

The Metropolitan Street Railway Company of New York has been authorized by the State Board of Railroad Commissioners to issue $7,000,000 new stock, which will be used in changing the motive power on a number of its lines.

President Gordon Abbott of the Massachusetts General Electric Company, of which the Lowell & Suburban is now a part, reports that for the year ending with June 30 the gross earnings of the roads, exclusive of the Lowell & Suburban, were $3,102,518.

The Railroad Commissioners of Massachusetts have authorized the Northampton & Amherst Street Railway Company to issue $60,000 five per cent. 20 year additional bonds for funding floating debt and to meet cost of abolition of grade crossings.

The New York State Railroad Commission is considering the application of the New York & Brooklyn Transportation Company and the New York, Brooklyn & Jersey City Rapid Transit Company for permission to construct a $30,000,000 tunnel under the East River.

At a meeting of directors of the Lowell (Mass.) Electric Light Company it was voted to increase the capital stock of the corporation from $300,000 to $400,000 and to offer $100,000 of new stock to the stockholders of record May 23, 1900, at par, subscriptions to be paid September 1.

A meeting of the stockholders of the Syracuse & Oneida Lake Electric Railway Company, Syracuse, N. Y., will be held August 21 for the purpose of voting on a proposition to increase the capital stock of the company from $300,000 to $1,200,000, to consist of 12,000 shares of the par value of $100 each.

The South Shore & Boston Railway Company has been authorized to issue additional capital stock to the amount of $175,000. Of this amount $100,000 goes for payment and capitalization of floating indebtedness, $20,000 for additional car equipment and $55,000 for additional electric overhead equipment.

The Twin City Rapid Transit Company has declared a dividend of 1½ per cent. on its common stock, payable August 15. Books close August 9 and reopen August 16. The company in August, 1899, paid a dividend on its common stock of 1 per cent., and in February last it paid a dividend of 1½ per cent.

The Minneapolis General Electric Company reports June gross earnings of $29,675, compared with earnings of $18,299 in June, 1899. The addition to the company's water power plant will shortly be completed, and the increase in water power capacity is expected to produce a material decrease in operating expenses.

The Massachusetts Railroad Commissioners have authorized the purchase of the Providence & Taunton Street Railway by the Taunton Street Railway Company. The board has also authorized an increased issue of $175,000 capital stock by the Taunton Street Railway Company for the exchange of shares of the Providence & Taunton Street Railway Company on a basis of share for share.

The stockholders of the Electric Storage Battery Company of Philadelphia, at their special meeting on August 1, ratified the resolution that passed recently to amend the certificate of incorporation to entitle the company to take advantage of a more liberal law of New Jersey. For the six months ended June 30 the earnings of the company were $1,400,000, compared with but $525,000 the same period last year, a gain of $875,000.

The Electric Storage Company of Philadelphia on August 4, under protest, paid the State of New Jersey $3,600 as a fee for filing amended articles of incorporation. When the company was originally incorporated with a capital of $18,000,000 a fee of $3,600 was paid, and the officers of the company claim that no charge should have been made for the filing of the amended articles. It is probable that the case will be carried to the courts.

The annual meeting of the Boston Electric Light Company is called for August 14. The annual report for the year ended June 30, to be submitted, will show gross earnings of $990,797, against $910,892 last year; net earnings for stock of $367,511, against $252,397 last year, and a surplus above dividends of $182,787, which compares with $108,489 in 1899. This surplus is increased by $253,294, as premium on stock sold.

The Western Union Telegraph Company finds the high price of copper a serious bar to the reduction in expenses which officers of the company hoped to be able to make. It has been apparent to the management for a good while that improvement in the position of the company must come largely through any reduced expenditure, but there has been one obstacle after the other in the way of obtaining this result. One has been the necessity of replacing a great amount of old wire with new copper wire. Another has been the constant demand for extensions, and, in the last year, the increased cost of materials has been added to other requirements. The difficulty in having profits increase in proportion to the increase in the volume of business is strikingly shown by a comparison of results. For the year ended June 30, 1867, the Western Union sent 5,879,282 messages. The receipts of the company were $6,568,925 and the profits $2,624 919. For the year ended June 30, 1899, the company sent 61,398,157 messages. Its receipts were $23,954 312 and its profits $5,868,732. A ten-fold increase in the number of messages brought less than a four-fold increase in receipts and only a little more than doubled the profits.

The New York "Commercial" says: "According to many of the bondholders the plan of the General Electric Company for the retirement of its outstanding 5 per cent. debenture bonds is not as successful as was expected, owing to the price at which the stock is selling. The exchange is to be made on a basis of 120 bonds for 100 shares of stock. At the present quotations the bondholders would be out upward of $900 on every 20 shares turned in, calculating on a basis of market value. According to reports from Boston the transfer is progressing slowly. Bondholders say that 140 for the stock alone will induce them to make the exchange. Regarding the proposed plan for the retirement of the bonds of the General Electric Company a stockholder is quoted as follows: 'The exchange is optional with the bondholders, and they would be foolish to surrender their holdings at the present quotations of the stock and bonds of the company. It is very much of a question in my mind whether or not debenture bonds on a 5 per cent. basis are not preferable to common stock on a 6 per cent. basis, subject to such fluctuations as it has undergone in the last year. It is not certain the stock will remain at 130, and then the company may not be able to maintain the present dividend rate of 6 per cent.'"

EDITORIAL NOTES.

The Coming Electrical Congress at Paris.

The International Electrical Congress, which is to be held at Paris, will meet at 10 A. M. on Saturday next, at the Congress Hall, near the Alma Bridge, in the Exposition grounds. Later meetings will be held at the well-known scientific headquarters, 44 Rue de Rennes. A long programme has been sketched out, covering every topic of interest to electrical engineers and physicists.

As stated some time ago in ELECTRICITY there will be five separate sections in which the following subjects will be discussed: "Scientific Processes and Measuring Instruments," "Production of Electrical Energy," "Electro-Chemistry," "Telegraphy and Telephony," and "Electro-Physiology." These general heads will be subdivided into numerous topics of vital interest to the electrical fraternity.

The Congress will last a week, which should ensure a thorough discussion of the papers presented. The results will be watched with interest by persons connected with the electrical industry the world over.

* * *

The Third-Rail.

The so-called third-rail system of electrical train propulsion has in many instances of late taken the place of the overhead trolley in localities where the erecting of an overhead conductor would prove impracticable, or where, as in sparsely settled districts, long uninterrupted runs at a comparatively high rate of speed are desired. This practice of drawing current from a rail laid along the track unquestionably has electrical and mechanical advantages to recommend it, but, on the other hand, the very many accidents which this system is responsible for indicate that the system is not an ideal one and that precautions should be taken to protect human life. This is forcibly brought out in the fact that scarcely a week passes but what injuries of a more or less serious nature to pedestrians are reported, and only last week a boy lost his life in an accident of this nature in Brooklyn.

That the third-rail has now come to be a necessity there is little doubt, and such being the case it would seem as though some inexpensive scheme could be devised for, if not entirely removing danger from it, at least reducing the chances of an accident to a minimum.

Where a third-rail is laid on an elevated structure, such for instance as that of the Manhattan Railroad Company of this city, it would seem as though with the exercise of a little ingenuity the rail might be placed below the ties in such a way that the shoe of a plough would bear "up" against it and not down on it. This arrangement would undoubtedly entail considerable extra expense, but would on the other hand make an accident through short circuit impossible.

Where an electric surface road makes use of the third-rail of course the above arrangement would be out of the question, unless the company saw fit to go to the expense of building a conduit, which, on a long stretch of track running through a sparsely settled community, could hardly be expected of it. Under these circumstances a company should at least adopt the precaution taken by the Baltimore & Ohio Railroad Company on its new third-rail system through the Belt Line tunnel, by encasing the third-rail between two planks set on edge, the top edge of the planks extending an inch or so above the rail. This arrangement would not entail a large expenditure of money, but would be the means of preventing accidents.

That some such scheme will ultimately have to be adopted on third-rail roads is evident, as public sentiment will demand it.

* * *

Electricity from Heat.

A few months ago we referred in these columns to the fact that a number of inventors were at work trying to devise an efficient thermopile, and also called attention to an invention in this line just then patented. We now hear of two new devices of this nature—one brought out in Germany, the other patented by a resident of Memphis, Tenn. In the German machine the couples are made of iron and nickel firmly brazed together. They are arranged, according to reports, like the windings of an ordinary electric motor, with one set of junctions brought conveniently to the surface where gas jets play upon them. The other set is cooled by a rapid circulation of air, engendered by a rotation of the machine. This thermopile, it is stated, is as yet not perfected and of little or no practical value.

The thermopile of the Memphis inventor, from the somewhat meagre information at hand, resembles to a certain extent the Cox

Digitized by Google

thermopile (described in the issue of ELECTRICITY of May 9, 1900), except that the rings are wound with wire made of a secret alloy. The Cox pile, as will be recalled, consists of a series of castings, composed of antimony and zinc, connected by thin strips of copper.

The Memphis inventor appears to be extremely optimistic and claims that he can build a thermopile capable of generating forty horse power. On the other hand, he acknowledges in an interview that so far he has only succeeded in producing a generator capable of developing five watts, with which a bell may be rung and a small fan operated. In other words, this new thermo-electric generator is apparently capable of accomplishing no more than the old Cox generator could several years ago. The inventor says:

"My theory is that the electric currents of the earth are caused by the conglomerate metals in its crust becoming heated. After years of experimental work I hit upon a peculiar alloy, which is, in my belief, the same in effect as the combined minerals of the earth. By the use of this alloy, and by employing platinoid wire in winding my generator rings, I get, when they are heated, electricity."

It is to be feared that owing to the high price of platinum wire, machines of this type will not be in great demand even though, as the inventor claims, they will convert 80 per cent of energy from 100 per cent. of energy in the coal used.

* * *

Can the Energy Lost in Resistance be Utilized?

That there is an immense amount of energy which might possibly be converted into useful work that goes to waste through resistance and friction in the mechanical world is undeniable. As an example the steam engine may be cited, which, as is generally known, converts but about .005 per cent. of the energy of the coal burned in operating it into work. Numerous other examples could be mentioned, such as the friction of shafting in factories, where frequently 30 per cent. of power is lost in friction, while in electrical undertakings an immense amount of power is taken up by useless resistance in wires. Referring to the latter a writer in a recent issue of "Elektrotechnischer Auzerger" of Berlin, discusses the question as to whether the energy lost in regulating the resistances of motors and steadying resistance of arc lamps cannot be usefully employed. In the case of resistances such as those in series with fan motors, which are often kept running for a considerable period at less than their full speed, he suggests that low voltage lamps might take the place of the resistance coils, these lamps being in situations where momentary extinctions would not be of great importance. At the points where these lamps are he proposes to place a second lamp fed by the full pressure of the mains, and the regulating switch of the motor is to be so arranged that as soon as the low voltage lamps (serving as resistance) were switched out, the ordinary voltage lamps would be switched in, the contacts of this switch being placed so that the two lamps could not be alight at once. In the case of arc lamps, he suggests the use of cooking or heating apparatus having the same resistance as the steadying resistance, which could be switched on in place of the latter when required for use. He also proposes that fan motors and similar motors might be used in the same way. Arc lamp circuits and even incandescent lamps might be used for the same purpose where an unsteady light is permissible. This latter suggestion, says the London "Electrician," commenting on the article, hardly appears practicable, as the life of the lamps would be considerably shortened by the over-running occasioned by the carbons of the arc coming too near together, for even a relay to put in a substitutional resistance would hardly work to prevent this.

This subject of utilizing useless resistance is a most interesting one, and should certainly be worthy of a careful and systematic investigation. In this connection it might also be pointed out that an immense amount of power is wasted through friction in stopping railway trains and heavy trolley cars by the application of the brake shoes to the wheels. Could this wasted energy lost in heat be in some way saved it would go far toward making up for the large excess of current required to start a heavy trolley car from rest. It is to be hoped this subject may also receive the attention of some enterprising investigator.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

REGARDING the electrical treatment for tuberculosis devised by Dr. C. C. Carroll of this city, and referred to editorially in last week's issue of ELECTRICITY, there would seem to be some doubts of its efficacy, as one of the patients recently treated, and alleged to be cured, denies emphatically in a letter to the N. Y. "Herald" that he ever had tuberculosis.

THOMAS HENSON, of Pittsburg, Pa., is in Monterey, Mexico, negotiating for the purchase of the two street railway systems of Monterey in behalf of an American syndicate. If the deal is consummated, the systems will, it is stated, be consolidated and converted into an electric line.

The Manhattan Railway Company of New York has filed plans for three electric power stations to be located on the east side of the city.

NEWS from London states that the town council of Southend, Essex, has accepted the tender of a Philadelphia and London firm to build electric tramways at a contract price of £87,500.

LAST Saturday President H. H. Vreeland of the Metropolitan Street Railway Company of New York gave a large delegation of employes their annual clambake and outing. The employes left the Grand Central Station shortly after 9 o'clock in the morning for Brewster, where the Vreelands have a country home. Prominent citizens met the guests at the station. Carriages were in waiting and they were driven to Lake Tonetta to the house of the Tonetta Outing Club, of which Mr. Vreeland is a member. A concert was given by the Brewster Band, and shortly after 1 o'clock it was announced that the Rhode Island clambake, which had been under preparation, was ready. The party, after partaking of the bake, spent some time in fishing, when they again took carriages and were driven to Rest-a-While, the Vreelands' country home. They were warmly received by Mrs. Vreeland, who was assisted by some leading society women of the village. President Vreeland made an address of welcome, speaking of the support the employes had always given him. Then there were responses assuring him that he was held in the utmost esteem by the employes. Luncheon was served, the party returning by special train.

A REPORT from Middletown, Conn., confirms the statement that William Gray has invented a button attachment for the slides in the coin receivers at the branch telephone pay stations. It is designed to prevent mistakes by subscribers in placing coins in the wrong slot when calling up a number. At present users of telephones at public pay stations often place money in the wrong division, which fails to ring the signal at the central station. Mr. Gray has been working over this difficulty for some time and has patented his idea, which he thinks will obviate the trouble experienced by subscribers heretofore.

DURING the recent flower parade connected with the Street Fair in Joplin, Mo., automobiles, tallyhos, carriages, several sedan chairs and other conveyances were handsomely decorated with flowers of all kinds and colors.

THE laying of the first telegraph cable to connect the United States directly with Germany was started Saturday morning from the Commercial Cable Company's station on Coney Island. It will make the second cable connection between this country and the Azores, and will be the most direct telegraphic line to the European Continent. The cable is approximately 2,400 miles in length. It will connect at Horta, Fayal, with the German-Atlantic Telegraph Company's cable, which was recently completed from Horta to Emden, in Germany, and is already in operation. The cable will be worked in New York by the Commercial Cable Co., at Horta by the German Atlantic Telegraph Cable Co., and at Emden by the German telegraph administration, all telegraph lines in Germany being under the direction of the Government. The cable will be put down by the cable ship Anglia, which is said to be the most perfect vessel of her kind ever built. It is expected that the cable will be ready for the transmission of messages soon after September 1. The cost will be about $5,000,000.

PROMINENT business men of Henrietta, Tex. have lately made application for a charter authorizing them to do business under the name of the Henrietta Gin & Light Company. They will erect a modern gin at once to be ready for business by September 1. The purpose is not to make money out of the enterprise but to gin cotton and furnish electric lights at the lowest possible cost for farmers and citizens.

THE fire-alarm telegraph of the Fire Department of this city recently installed a new transmitter, costing $5,300. It will be used for sending out fire alarms, and will operate automatically. Under the old system there were three different instruments requiring three operators. The new instrument needs only one operator, and will do the work of the three instruments.

ELECTRICITY is finding extensive employment both for lighting and power purposes upon some of the newer ships of the German navy. In proof of this, says the London "Electrical Engineer," it will suffice to instance the

Digitized by Google

Fürst Bismark, which possesses, perhaps, the largest electrical installation of any war vessel in the world. The vessel in question, it may be mentioned, is an armored cruiser displacing some 10,608 tons. Her electrical equipment comprises five compound-wound steam dynamos, each having an output of 590 amperes at a terminal potential of 110 volts. The electromotors on board number 43, while five 40,000 c. p. searchlights are installed, besides about 1,000 incandescent lamps. In addition to the interior lighting of the ship, and for the telegraph, signaling and searchlight apparatus, etc., electrical energy serves for working the numerous ventilators, ammunition hoists, gun turrets, steering gear and boat hoists.

THE Mexico City lighting service comprises 481 electric street lights of 2,000 candle power, 366 of 1,200 candle power and about 150 incandescent lights of 16 and 50 candle power. The cost of the service per month is about $24,000.

THE Ganz system for working electric railways by means of multiphase current has been successfully experimented with in Budapest, Hungary. The system is now to be tried experimentally on the Valtelina stretch of the Italian State Railways. The length of this section of the line is about 65 miles, but we are not sure how much of it is to be equipped for the experiment.

THE Convention of the Association of Edison Illuminating Companies will be held at Saratoga September 4, 5 and 6. Headquarters will be at the Grand Union Hotel. About one hundred delegates are expected to be present.

A DISPATCH from Copenhagen states that the Great Northern Telegraph Company says that the war ships of the allies at Taku were communicated with recently over the new Chefoo-Taku cable. The new cable between Chefoo and Port Arthur will be ready for use within a week, and those between Chefoo and Wei-Hai-Wei, and Chefoo and Shanghai in a month's time.

PERMISSION has been granted the New York Electric Vehicle & Transportation Company—the old Fifth avenue stage line—to change its motive power and to extend its route. The extensions are from 89th street and Fifth avenue, up Fifth avenue to Mount Morris Park, west around the park by 120th and 124th streets to Fifth avenue again, and up to 135th street; from 89th street and Fifth avenue to 110th street, to Cathedral Parkway, to Riverside Drive, and from 57th street and Fifth avenue west to Broadway, and up Broadway, crossing the Grand Circle to West 72 street, to Riverside Drive, to 124th street.

THIS fall will see the cessation of the mail car service in this city. The Metropolitan Street Railway Company, which controls by stock ownership the Third Avenue Railroad Company, has decided not to renew the contract the latter corporation had with the Post Office Department at Washington for the last five years to carry mail bags over the system. Present indications are that the old method of transporting the mail uptown on the Third avenue elevated road will come into practice once more. The contract for carrying the mail went into effect in the latter part of October, 1895, to run five years, so that it will expire in less than three months. According to the present system the the Third avenue maintains a service between the General Postoffice (over its surface car route by way of Third avenue, 125th street and Amsterdam avenue) and the branch postoffice at 157th street and Amsterdam avenue. President Vreeland, of the Metropolitan Street Railway Company, admitted recently that his company had decided not to renew the contract, but was reticent as to the reasons for the decision. It is understood, however, that the risks incident to the carrying of the mails have made it a transaction which does not pay, in view of the moderate compensation. This is said to be because the use of mail cars means an increase in accidents. These cars are hitched as "trailers" behind the regular passenger cars, and people who stepped from the latter have been caught occasionally between the passenger and mail cars.

A CABLE dispatch from Paris states that seven balloons left the Parc d'Aerostation at Vincennes recently, competing for the prize offered by the Exposition.

A LONDON contemporary states that the German Government is testing the value of certain improvements in telephones, and the Bank of Darmstadt has now been entrusted with the floating of the novelties. It is claimed that the spoken message can be recorded in such fashion as to be reproducible as often as required; and that one wire under the new system can be used simultaneously by several persons. The sound is also strengthened, so as to make long-distance work easier, and a message can be transmitted simultaneously to various points.

THE street railway lines in Moscow, Russia, are about to be extended, and will reach a total of 84 miles. It has been decided at the same time to change the present system of horse traction for the electric trolley system over the greater part of the lines, while the remainder will be operated on the surface-contact system and by storage batteries. The cars will travel at a speed of 12½ miles an hour. The time limit allowed for the conversion of the lines from horse to electric traction is four years.

The Navy Department has decided to establish an electric equipment plant at the Portsmouth navy yard, and for this purpose $100,000 has been appropriated. An officer has been detailed to the local yard to study the methods and system. The establishment of that plant may seriously effect the local navy yard in regard to work. At the present time the work in this department at the local yard is slack. The local equipment plant has been converted into an extensive manufacturing establishment. It practically manufactures all the electrical equipment necessary for the navy. When the plant at Portsmouth is running it is expected that a large amount of work will be taken away from the local yard.

REPRESENTATIVES of the Gould Storage Battery Company, of New York, and the Electric Storage Battery Company, of Philadelphia, are making severe tests of their storage batteries under the supervision of the officials of the Cincinnati Street Railway Company to ascertain which will stand the greater strain. Each has five cells of batteries at work, which they are charging and discharging by running current into them. The switch is then thrown, and the current is allowed to escape through running water. In this way the most powerful battery will show up best, and the street car company will select the one giving the best service.

The Theory of the Coherer.

Messrs. K. E. Guthe and A. Trowbridge contribute a valuable article on the above subject to the July number of the "Physical Review." After giving a brief résumé of work done by other experimenters and also of past theories on the subject, the authors proceed to describe their own original investigations and to analyze them by means of curves. Their conclusions on the subject, in which they attribute the high original resistance of the coherer to the film on the surface of the metallic particles, are as follows: "Dorn has shown that very little or no coherer action takes place between surfaces of the noble metals when they have been heated in a vacuum so as to expel as far as possible the surface film. He also found a decided decrease of resistance for other metals. Aschkinass, on the other hand, tried to remove the surface film from the filing particles in a tube by exhausting and heating, but did not observe any change in the behavior of the coherer. He admits himself, however, that this can hardly be considered a decisive test.

"The fact mentioned above, that metallic surfaces after thorough cleaning do not show high contact resistance, is also in favor of our supposition, and we believe that Auerbach's results can easily be explained by the rubbing away of the films by mechanical action. The films must form a sort of protecting layer on the metal surface, as the following experiment shows: Two coherers, consisting of one contact each, were put in parallel and the circuit closed through them. The resistance of each was measured before and after lowering, and it was found that coherer action took place in one only. After standing a day this one was always oxidized, while the other showed a bright surface where the balls had been in contact. The coherer action had apparently destroyed the protecting film of the one in which it took place.

Aschkinass mentions his interesting results with coherers consisting of PbO_2 or CuS particles as a proof against Lodge's theory. They behave in the opposite way from the ordinary coherer. We would suggest, in view of the similarity with polarization, that the compounds are in this case broken up into two components, one of which conducts well and the other poorly. No actual metallic contact need then occur, and the S or O mould would play a decided rôle in the increase of the resistance. It seems that particles of any conducting substance may form a coherer—among others, carbon. This suggests an interesting question in connnection with the electric arc. Ayrton and Perry found that the difference of potential between the two carbons of an arc lamp was independent of the current strength, provided the distance between them was kept constant—i. e., the apparent resistance of the arc was inversely as the current. Does this correspond to the horizontal line of our curves, and does cohesion play any part in the starting of the arc? We offer the foregoing considerations merely as a tentative explanation of this little understood phenomenon, being well aware that some of our assumptions are somewhat crude, but hoping, nevertheless, that they may lead to a fuller understanding of the suject, since they seem to furnish a satisfactory hypothesis."—The "Electrical Engineer," London.

THE GRAPHOPHONE GRAND.

[NOTE.—An exhaustive and ably written report on the merits of the "Graphophone Grand" was made to the Franklin Institute of Philadelphia by its Committee on Science and the Arts and is published herewith. The Institute adopted the report on January 3, 1900, and the document was printed in full in the July number of the "Journal of the Franklin Institute." The report is on the invention of Thos. H. McDonald of Bridgeport, Conn., and gives a general history of sound-recording and reproducing devices, and will undoubtedly prove of interest to readers of ELECTRICITY—ED.]

The Franklin Institute of the State of Pennsylvania for the Promotion of the Mechanic Arts, acting through its Committee on Science and the Arts, investigating the merits of the "Graphophone Grand," reports as follows:

The subject-matter of this application is a method of recording and reproducing sound, invented by Thomas H. Macdonald of Bridgeport, Conn., and termed the "Graphophone Grand." This method, as stated by Mr. Philip Mauro, in his presentation of the subject before the Franklin Institute (March 15, 1899), and also in the patent specifications, is a modification of and improvement on the method patented by Bell and Tainter in 1886. A proper understanding of Mr. Macdonald's improvement, accordingly, entails a due consideration of the earlier invention, and, coincidently, a review of the prior art generally.

Talking machines have been the aim of numerous inventors at least since, if not before, the year 1779, when the Imperial Academy of St. Petersburg offered a prize for the construction of a machine which should be capable of producing the vowel sounds as expressed by the human voice. The prize was awarded to Prof. Kratzenstein, for his devices and investigations, which resulted in considerably widening the horizon of acoustic science, and presently thereafter the Abbé Mical in Paris (1783) and Von Kreinpelen in Vienna (1788) were working in the same field. Many ingenious mechanisms were constructed by these workers, and improved upon by various successors, of whom Faber of Vienna, about 1850, produced a very remarkable speech-articulating machine. In 1857, however, the attention of inventors was directed to a more promising field of effort, through the labors of Leon Scott, who patented the sound-recording machine known as the phonautograph, in which the principles of acoustic physics were employed to produce an autographic record of the human voice and of other compound sound vibrations.

The optical demonstration of rhythmic sound-waves dates back as far as 1787, when Ernst Chladni published at Leipzig his epoch-making discoveries in this field, but although these developments were amplified by the researches of Strehlke in 1825, of Young and Wheatstone in the following decade, and by those of Tyndall, Helmholtz, Melde and Lissaoux at subsequent periods, the graphic reproduction of vocal sounds appears to have been first effected by Scott's appliance. In that instrument the sonorous impulses produced by speech and other non-rhythmic tones were graphically recorded through the vibrations of a tympanum consisting of a flexible diaphragm, acting by means of a stylus on a revolving cylinder, and it is this sensitive tympanum and its attached stylus, developed and improved by successive inventors, that form the essential elements in the talking machines of to-day.

The phenomena demonstrated by Scott were analyzed in relation to vocal sounds, and especially with regard to the separate functions of the vocal organs, by the French Linguistic Society in 1875, and these studies, together with Bell's invention of the telephone in 1876, gave a new impetus to research in the direction of talking machines.

In the spring of 1877 the Paris Academy of Science appears to have received from M. Charles Cros a communication proposing the production of Scott's sound records in the form of tracings on a transparent surface, and the reproduction of these tracings by a photo-chemical etching process in the form of sunken lines on the record plate. In a retracing of the record these lines were to serve as guides to the stylus, and thus the vibrations of the diaphragm, and, coincidently, the corresponding sound-waves, were proposed to be reproduced. A method analogous to this, but avoiding the intervention of photography, and producing the record directly on a plane metallic surface, was subsequently developed in this country (*infra*), but Cros appears to have gone no further than to make the communication referred to, which was not published in the "Comptes Rendus" until some six months later, in September, 1877.

THE GRAPHOPHONE GRAND.

In the same year, however, the actual reproduction of sound tracings back into perceptible sounds was accomplished by Thomas A. Edison, through his invention of the sound-recording and reproducing device termed the "phonograph." In this instrument the movements of the vibrating diaphragm, which Scott had translated into the form of a sinuous line traced spirally around a cylinder, were reversed in their effect. Instead of the stylus being caused to move in a plane parallel with the surface of the revolving cylinder, it was made by Edison to indent the surface, and thus the sinuosities of Scott's line on an even plane were transformed into similar sinuosities of a line in a varying plane. This was done with a view to causing the stylus to retraverse the variously indented line, and thereby reproduce in the diaphragm the vibrations, and, coincidently, the original sounds which had caused the indentations, and this effect was indeed produced in the mechanism which Edison devised for the purpose.

The movement of the recording stylus being derived from the minute impulses of sound-waves acting on a membrane, Edison found it necessary, in order to produce an indentation sufficiently marked to serve the purpose of reproduction, to reduce to the utmost possible degree the resistance of the receiving material to the impact of the vibrating stylus. To this end a thin grooved line was cut in a spiral around the receiving cylinder, and over this was fastened a sheet of tin-foil. By a suitable screw attachment the cylinder was revolved so that the spiral groove beneath the tin-foil passed under and in touch with the vibrating stylus, and thus the tin-foil was made to receive the impact of the stylus where the hollow groove in the cylinder left the foil without support. The indentations produced in the tin-foil by the movement of the stylus were sufficiently positive and distinct to permit their translation into audible sound-waves. This was effected by causing the spiral line of indentation to repass before the stylus in contact with the latter, and thus to actuate the stylus as by a succession of cams and correspondingly to vibrate the diaphragm, which in turn transmitted its impulses to the surrounding air in the form of sound-waves corresponding to those which had produced the indentations originally. Edison's phonograph was thus the first strictly acoustic talking machine.

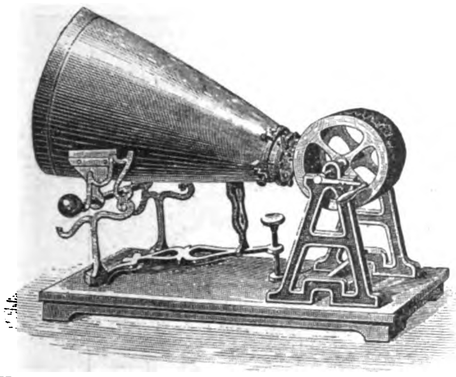
The very property, however, of the tin-foil, or of any similar material that afforded the possibility of its being sufficiently indented through the impulses of sound-waves, proved an insurmountable obstacle to its practical application for the purpose in view. A very few passages of the line of minute indentations in contact with the reproducing stylus sufficed to so far level down the spaces between the indentations as to practically obliterate the record, and though various means of giving permanence to the record were devised and put into practice, such as filling in with wax on the back, to stiffen it, or a reproduction of the surface by electrotyping, the technical difficulties encountered in these processes left the instrument unavailable for practical use.

Apart from various propositions to overcome this difficulty by causing a thin sheet of metal to vibrate in touch with a revolving cutting tool, in order to produce a sound record of durable quality, which does not, however, appear to have been actually attempted, the machinery of sound reproduction remained as Edison left it until 1886, when the efforts of Chichester A. Bell and Sumner Tainter, of Washington, D. C., afforded a solution of the problem. The advance effected by these two inventors consisted essentially in the substitution of a cutting edge for the indenting point of Edison's apparatus, and the coincident use of a material for their cylinders sufficiently cohesive to be practically available for reproduction and sufficiently amorphous to permit the cutting stylus to engrave its surface. The substance which was found to answer these requirements best is a compound of beeswax and paraffin, which in practice was imposed on the surface of a cylinder of pasteboard. The stylus, having to cut into the surface of the recording cylinder instead of indenting it, was accordingly fixed at an angle to the radius of the cylinder, instead of parallel with it, and being held by a light spring or weight, in contact with the revolving surface, while vibrating under the impulses of the sound-waves, the vibrations were recorded in the waxy material in the form of an engraved line whose depth varied in accordance with the vibrating movements of the cutting stylus. These cuttings gave at once a record deep enough for reproduction and rigid enough to permit the repas-

sage of the record in contact with the reproducing stylus a considerable number of times, without the successive elevations and depressions of the record being materially altered in their relations. In this regard the smoothness of the waxy ground afforded a material advantage. The positive nature of the engraved record, and the strength of the material in which it was made, afforded also the possibility of the records being mechanically duplicated on other cylinders by transmitting, through suitable connections, the motion of the recording stylus on the former to a cutter on the revolving surface of the latter.

Apart from the great advance effected by Messrs. Bell and Tainter in producing the sound records in a comparatively permanent and practicable form, they improved in many important respects the various mechanisms required in the process. Their apparatus, in distinction from Edison's "phonograph," was called the "graphophone."

This historical review of the progress of sound-recording and reproducing mechanisms brings us, at this point in chronological order, to the consideration of another device for the same purpose, already alluded to, and which also may be regarded as starting from the phonautograph of 1857, but which, continuing on the lines of that instrument to obtain the

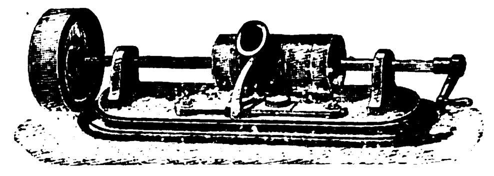


Leon Scott's Phonautograph.

record on a plane surface, diverged at this point and wrought this flat record into depressions by chemical means. These depressions, however, recorded the vibrations of the sound-receiving diaphragm in sinuosities of the side walls instead of sinuosities of the bottom of the lines. This was the so-called "gramophone," invented in 1887 by Emile Berliner, also a resident of Washington, D. C., and which was brought out before this Institute in May, 1888.

The principle of Berliner's procedure differs radically from those of his predecessors, inasmuch as his record, being effected by a stylus vibrating in a plane parallel with the receiving surface, is free from the disturbances resulting from a varying resistance to its movements. This latter factor enters inevitably into the result when a depression of any surface is effected by indentation or by cutting, the resistance naturally increasing with the depth of the depression to be produced, while the latter is directly related to the amplitude of the vibration which the depression is to record. Berliner's record was traced in the form of a spiral line on the surface of a disk of polished zinc, through a film of extreme tenuity, composed of a fatty acid obtained from a solution of wax. This film serves as a resistant to an etching mordant, which effects a depression of the traced line by erosion of the bared metallic surface, the etching then being ready for reproduction into sound-waves by reversing the procedure.

We now come to the latest innovation in acoustic mechanisms, the so-called "Graphophone Grand." This invention, as has already been noted, is a modification, by Mr. T. H. Macdonald, of the graphophone of Bell and Tainter. The improvement of the parent invention is effected (claim 1) "by imparting to

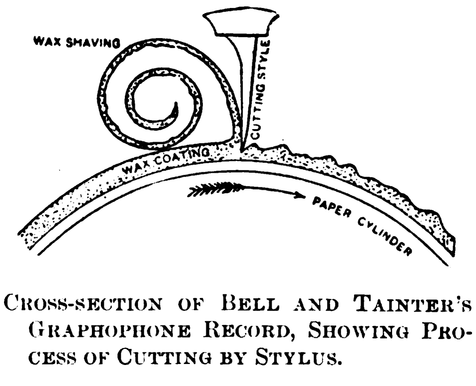


Edison's Phonograph.

the tablet a high surface speed, thereby forming undulations of great amplitude with long, gentle, easy strokes, as contradistinguished from a record of the same sound having short, abrupt undulations." Furthermore (claim 2) in the "placing of the vibratory cutting stylus in contact with a record tablet at an acute angle to the tangent at the point of contact.

With regard to these procedures, it appears that there is no difference between the graphophone record of Bell and Tainter and that of Mr. T. H. Macdonald, except "that the recording tablet of the 'Grand' moves with a surface velocity of from two and a half to three times that given to the small tablet. The former is made large because, for practical reasons, it is preferred to obtain the high surface speed by increasing the diameter of the tablet rather than by increasing its axial speed."

With reference to these practical reasons it is noted in Mr. Mauro's* presentation that "superficial considerations would indicate that such change in operation could only have the effect of producing a corresponding elongation of the undulations, and, in order to see a logical connection between the cause and effect, we must observe a little more closely the conditions under which records of sounds are made and reproduced." These conditions, it is stated, "may be roughly described as follows: The cutting stylus, performing its pendulous motion corresponding to the sound-waves, cuts a sinuous line composed of alternate elevations and depressions. As the cutting edge begins to descend to cut a depression, it at first encounters practically no resistance, the sharp edge alone being in contact with the material of the tablet; but, as the movement continues,



Cross-section of Bell and Tainter's Graphophone Record, Showing Process of Cutting by Stylus.

the crest just being formed by the descent of the cutting edge comes in contact with the shank of the cutting stylus, that is, the smooth cylindrical surface forming the periphery of the stylus. As soon as this occurs a check is imposed upon the further penetration of the stylus, which is no longer free to follow the movements of the atmospheric impulse. The effect of this check or damping influence is not merely to diminish the penetration of the stylus, but also to modify to some extent the form of the undulations.

"The effect of increasing the velocity of the recording tablet will now be easily understood. If that velocity be made sufficiently great, the crest of the undulations as they are formed are, so to speak, carried away so rapidly that they do not come into contact with the shank of the stylus at all. More exactly stated, the descending slope becomes a very gradual as distinguished from a very abrupt one, the curve approaching more nearly to parallelism with the recording surface. It follows that, the resistance or check being removed, the stylus will penetrate to a much greater depth than formerly, and will form undulations of much greater amplitude. The volume of sound being dependent upon the amplitude of the vibrations, the increased volume of sound is thus accounted for."

All this is quite true, but the utility of increasing the diameter of the cylinder to obtain the greater peripheral speed is not thereby made apparent. In a passage preceding the above quotation, it is noted that "when the speed is increased a proportionately greater amount of material is cut away in a given time, i. e., more work is done and more resistance overcome during the period occupied by the utterance of a given sound. It would appear to follow that increased velocity does not diminish the resistance to the movement of the stylus, but just the reverse. It is clear enough that greater peripheral speed is desirable to the end of making the indulations of the incision longer and correspondingly more gradual, but inasmuch as the length of the line and coincidently the extension of the undulations may be obtained on a smaller cylinder by increasing its peripheral speed, it appears certain that no gain in this respect is obtainable by the use of the larger cylinder. This conclusion is corroborated by a consideration of the element of resistance in relation to the angle of the cutting stylus to the tangent of the receiving cylinder. Immediately following the statement above quoted, Mr. Mauro notes as follows: "The factor of resistance, however, has had an influence in determining the angle of inclination of the stylus to the recording surface and the shape of the cutting point. The latter is formed by a small cylinder of sapphire cut off in a plane nearly at right angles to the axis, so that the cutting edge is approximately an arc of a circle. With such a cutter the resistance to its action would be greatest when it operates in a position normal to the recording surface, and least when placed tangential thereto. This theoretical position of least resistance is, however, inadmissible in the operation of recording sounds. In this operation we have two movements to consider. The first is the straight-ahead movement of the tablet which results nearly in the removal of the material in front of the cutting point and the formation of a groove. If the stylus were stationary during the operation it could, manifestly, and with great advantage, occupy a position almost tangential to the cylinder; but there is a second and all important movement, namely, that due to the vibrations of the diaphragm, which movement is substantially radial of the cylinder. It would be manifestly impossible for the stylus to perform this move-

* Read at the Stated Meeting of the Franklin Institute, March 15, 1899.

Digitized by Google

ment at all if it occupied the ideal tangential position, for that would imply forcing the stylus sidewise into the hard body of the tablet, a task far beyond the strength of the feeble sound-waves. In practice, therefore, the stylus has been inclined at an angle of about 35 to the tangent at the point of contact."

Thus, it appears that the additional work imposed on the cutting stylus by the elongation of the line which it must cut is overcome by giving the cutting tool a sharper angle of incidence and possibly a sharper cutting edge. The added work entailed on the cutting stylus by the increased depth of the depression, obtained by freeing its shank from the back-hold of the preceding elevation, may be left out of account as being equivalent in work of the power lost on the back-hold. We have, therefore, to consider only the final element of the subject here presented, the position of the cutting stylus in relation to the tangent of the receiving cylinder.

It is plain (1) that the most efficient position of the cutting stylus would be in the tangential position; (2) that the smaller the diameter of the cylinder, the more nearly could the tool be brought to the tangential position without suffering the hold-back of the ridges in effecting the desired impressions.

Conversely, the highest position, that is, the largest angle of incidence required for freedom from back-hold, would be necessitated if a flat surface were to be incised by the tool, and inasmuch as the surface of a large cylinder offers more nearly the geometrical condition of a plane than that of a small cylinder, it follows that the efficiency of a cutting stylus, depending as it does on the acuteness of its angle of incidence, would be greater on a small than on a larger cylinder.

The possibility of obtaining a greater volume of sound by enlarging the characters of the sound record is noted by Berliner in the "Journal of the Franklin Institute" for June, 1888. Mr. Mauro's statement that "methodical experiments have shown that beyond a certain critical speed there is no gain either in loudness or quality, but that on the contrary, the results deteriorate upon further increase of velocity," is in line with the previous observations of Berliner (Technische Notizen, etc., Leipzig, July, 1890), where, with reference to sound records on horizontal surfaces, it is stated "that the wave amplitudes increase up to a certain peripheral speed. Up to the present time this limit is reached at a velocity of 60 centimeters per second." This is equivalent to 36 meters per minute, while Mr. Macdonald stated it as being approximately 44 meters.

The utility of increasing the peripheral speed of a cylinder in which a sound record is to be incised is apparent in the greater gradation of the undulations, and in the freedom from back-hold of the cutting stylus which these more gradual undulations afford. The embodiment of this utility in the Graphophone Grand is hereby recognized by the Franklin Institute, through the award to Mr. Thomas H. Macdonald of a Certificate of Merit.

In view, moreover, of the material advance effected by Messrs. Chichester A. Bell and Sumner Tainter in the development of sound-recording and reproducing mechanism, through their invention of the graphophone, the Franklin Institute recommends the award of the John Scott Legacy Premium and Medal to the said inventors jointly.

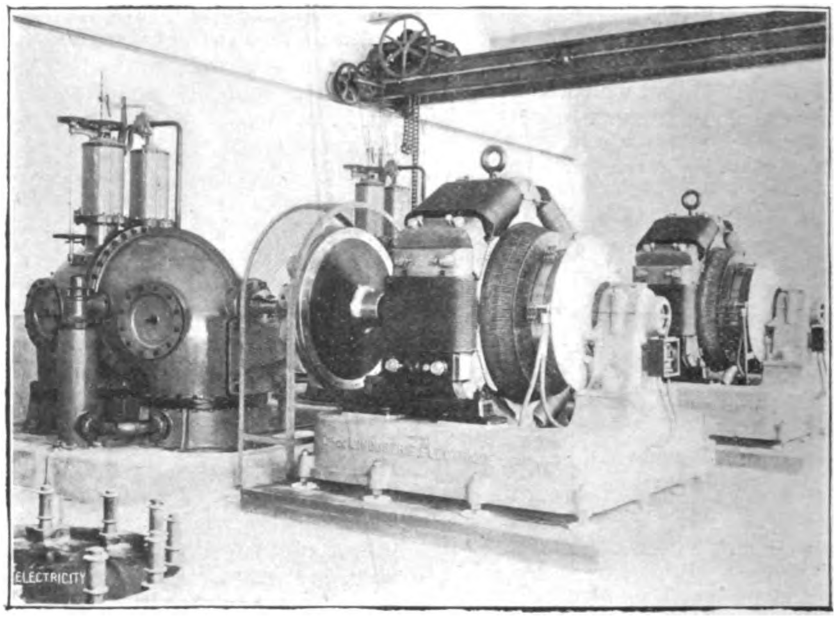
A HIGH TENSION DIRECT CURRENT POWER TRANSMISSION.

BY FRANK C. PERKINS.

The Association of the Communes of Val-de-Travers was formed between the districts of Noiraigue, Travers, Couvet and Fleurier, Switzerland, with a view to utilizing a water power on the Areuse River where it leaves Val-de-Travers.

The available fall was 29 meters with a volume of two cubic meters at low water, but this would not furnish sufficient power for the complete development of the electrical distribution planned for these villages.

Couvet had been lighted by gas and had discarded it. Fleurier alone had bought, developed and perfected a gas works and had not to rely solely upon electricity. It was therefore necessary to supply more current at times than the water available would furnish. The high tension direct current system was adopted as the best solution of the problem. At the power house three groups of generators were installed of 250 hp., furnishing a direct current at a potential of 2,600 volts each. The machines were wound for a constant current of 65 amperes and are seen in the accompanying illustration. The machines are operated in series at several thousand volts and each machine has its base carefully insulated and mounted on porcelain supports and is seen in the view.



D. C. Generator Power Plant at Val-de-Travers, Switzerland.

The line is 35 kilometers long and consists of conductors 10½ millimeters in diameter. At the receiving stations transformers and storage batteries are used, supplying the network village distribution with three wires at 125 volts potential. The power distributed consists of 130 hp. in motor, and the lighting consists of 6,400 incandescent and 6 arc lamps.

The building of the system of telegraphs that is to connect St. Michael with Nome and other points along the northwest Alaskan coast will soon be begun. At the same time the Canadian Government will be pushing their line from Dawson, down the Yukon, till it meets the United States line. These two lines, will extend through all the main mining districts and settlements and Government posts thus far established.

SOME NOTES ON INQUIRIES FOR ENGINES.*

BY J. A. SEAGER.

The following are a few suggestions for guidance in inquiring for an engine which will be found to obviate much unnecessary correspondence, and facilitate the delivery of a satisfactory steam unit. It is remarkable how many omissions can be made in a single inquiry, apparently due, not so much to carelessness, as to a misunderstanding of the requirements of the engine-builder. It would add greatly to the quality of the work done, besides cheapening the price and reducing the time of completion of work, if the requirements of the customer could be made to agree more closely with the standard practice of the engineers. The present notes are limited to main engines, such as those used for mill machinery, electric power plants, steamship propulsion, etc.

Horse-Power.—It seems almost unnecessary to say that the horse-power of the engine should be stated. The brake horse-power should preferably be specified. In arranging for belt or rope driving, as a percentage of power is lost in transmission, a 5 per cent. increase should be made to the calculated brake horse-power of the engine for short single drives, longer drives or multiple drives, of course, involving a greater percentage loss. It should be mentioned whether the driving is to be by rope pulley, belt pulley, or half-coupling for direct driving.

Steam Pressure.—I have seen a few engines from which the boiler pressure has been omitted, although it is obvious that an engine cannot give the same power with low as with high pressure steam. If no boiler has as yet been installed, the engine-makers should be asked to state the most suitable boiler pressure. If the boiler is already laid down, its working pressure, less the loss of pressure along the steam-pipes (which may be from 5 lbs. in short, well-designed lengths, to as much as 15 lbs. in long or crooked arrangements), should be stated in the inquiry.

Speed.—The question of speed has an important influence, not only on the size of the

* Paper read before the Students' Section of the Institution of Electrical Engineers, London.

Digitized by Google

engine, but often on the type also. For example, high-speed-engines—i. e., from, say, 350 to 600 revolutions per minute—are now usually built vertical, and often with their cranks, connecting rods, valve motion, etc., enclosed. With slower speeds, however, horizontal engines with large cylinders and unenclosed mechanisms are employed, or in situations where ground space is begrudged (as on shipboard and valuable ground), these open-type engines are built vertically. It is not always possible to give the engine-maker much latitude as to speed at which he may run his engine, but wherever possible he should be allowed to select his own, or, at the very least, be given some slight range to choose from, in order that he may put in a standard, and, therefore, cheap size which will run economically.

CONDENSING.—Although an economy can be effected by the use of a condenser, an engine should not be changed over from an atmospheric exhaust to a condenser without one is sure that it is mechanically strong enough to stand the strains due to increased difference of pressure on the faces of the piston, and the greater mechanical force transmitted at the same speed. For this reason the engine-maker should always be informed whether a condenser is to be used or not. Two other reasons may be cited: The distributing valves would be set differently for the two conditions, and possibly a smaller engine could be put in if it were to run condensing. With large-sized engines it is often advisable to have a separate condensing plant for each engine, the pumps for which could either be worked by the main engine or by small auxiliary engines. It is preferable, however, to leave this point to the engine-maker's discretion.

DESCRIPTION OF SITE, ETC.—It would be disappointing if, after the engine was delivered, it was found to be too large in one of its dimensions for the space provided for it. The client should therefore either send a dimensioned sketch of his foundations, if supplied, or of the site, and also the height to roof, traveling crane, or other obstruction; or he should ask the engine-maker to send an outline drawing giving the main dimensions of the engine when tendering. If the engine is to be erected inside a building, it would be well to make sure that there is a door or other convenient opening large enough to admit the engine when it arrives. A description of the site should always be sent. For example, it is of interest to the engine-maker to know whether his engine is to be placed on board ship or on a concrete foundation, for in the latter case only will foundation bolts and plates be required. If the engine is to be erected by the engine people above or below ground level, this must be mentioned, as special lifting or lowering tackle would have to be provided. Details should be given as to the nature of the approach to the site—whether by land or water. In the former case it should be stated whether there is a road suitable for heavy traffic leading to the site; in the latter, whether there is a craneage wharf handy, and in both cases whether there is a traveling crane or other suitable means for handling the engine on site.

ERECTION.—In the matter of erection, however, the client has the choice of three alternatives: (a) giving the engine-maker the order to erect the plant complete on foundations to be supplied by the client if they are requisite, and giving the above information in full detail. (b) asking the engine-maker to quote only for skilled labor in erecting, the client himself providing all rough labor, cartage, etc.; (c) the client undertaking to erect the engine on site himself, in which case he should ask for quotations f.o.r. or f.o.b. at the nearest railway station or dock. The first method is the most costly, but usually ensures good work. The last is perhaps cheap, and the result may be good or bad according to circumstances. It should be understood that only under exceptional circumstances and by special arrangement will engine makers allow in their price for building foundations for the engines, or for any masonry, builder, or joiner's work required, or for any excavating, cutting away, or making good again. If such work is required, it must be definitely mentioned in the inquiry, and care should be taken to see that the engineer has bound himself to do the work.

COMBINED PLANTS.—For many purposes where small powers and high speeds are required, such as centrifugal pumps, fans, electric dynamos, etc., it is customary to supply a direct-coupled set mounted on a common bedplate, thereby cheapening the cost of erection. In such cases the engine-maker will supply the base-plate with his engine, and will, if requested, receive the apparatus to be fitted at his works, couple the same to his engine, and deliver the complete set ready for erection on the foundations. As a matter of fact, he will often undertake to supply the combined plant complete, fitting his engine to suit the needs of the fan or dynamo to be supplied on receiving particulars of the work to be done by the plant. This method of ordering is recommended to non-expert purchasers, as it saves trouble for the client, and throws the onus of failure or defect entirely on the engine-builder.

TOOLS, ACCESSORIES AND SPARES.—A clause should be included in the inquiry calling for all necessary tools, accessories and spares. A firm of good reputation will put in a suitable set without further information, but as a check the following items (though not forming a complete list) should be looked for—a complete set of spanners on rack, to be kept on rack except when being used on the engine, and any special tools required; spare springs and rings for pistons, and, if needed, valves; set of main brasses and smaller brasses; eccentric strap and governor springs if required; barring gear, tachometer, steam pressure and (if running condensing) vacuum gauges, etc. Cans, tanks, and filters for oil are not usually supplied by engine-makers. It should be specially stated whether steam and exhaust stop valves are required with the engine, or whether they will be supplied with the pipework. Engine-makers cannot be expected to connect their engine to steam, exhaust or drain pipes unless this was arranged before signing the order, and if connecting pipes or bends have to be placed between engine and main pipes, the position of the flanges on the latter with relation to the engine should be indicated when asking for a tender.

NATURE OF LOAD.—Different types of engines, equally high class in workmanship, are designed with varying intent. Some are meant to withstand severe shock, such as is experienced in rolling mills: others, such as are used in cotton mills and electric generating stations are required to give very uniform speeds under varying loads: others again, where fuel and water are expensive, are designed to give extremely low water consumption and high efficiency; still others, destined to be placed in populous localities or on slight foundations, necessitate a careful balancing of moving weights to reduce vibration. If any such special conditions exist they should be stated, so that the engineer may form an opinion as to whether heavy frame-work, Corliss valve gear, three-cranked shaft, etc., are applicable. It should be carefully stated whether the direction of rotation of the engine is to be reversible or not, unless the particulars given of the work to be done imply one or other of these conditions as essential. If the engine is always to turn in one direction, it should be clearly stated which direction would be preferable, as "the engine to run clockwise, or counter clockwise, as seen from the end of the crankshaft next the coupling or pulley."

STEAM CONSUMPTION AND EFFICIENCY.—Where steam consumption and efficiency are important, makers should be asked to state a guaranteed value for these in their tender at, say, full and half load. These values should be tested when the engine is built, either at the engine-maker's works or on site. In the former case the client is at liberty to see the tests carried out and verify the results himself; or he can have a signed certificate of tested results. In the former case it almost goes without saying the traveling expenses of the client are not included in the engine estimate, and it would be a breach of courtesy at least to claim from the engine-maker any sums spent in this way. If the tests are conducted on site, all fuel and water required for the test should be supplied by the client. It should be noted that the efficiency of an engine when new is generally some 5 per cent. less than when it has been running a short time, as the piston rings and bearings have not then come to a proper bearing surface.

SPEED REGULATION.—A point respecting speed regulation should be explained for the benefit of those who require very good governing. It is customary to test the action of the governor by suddenly throwing the full load off the engine, and expressing the increase in speed as a percentage of the original speed. This percentage will be guaranteed by the builder if required, and in good engines will not be above 3 per cent. But it is an instant or two before the governors will "get hold" of the engine after the load goes off, and the speed flies up possibly over 10 per cent. above normal. This excess of speed, though lasting only a short time (at most 10 seconds with good governors), would be sufficient to burn out a high-efficiency electric lamp if the engine were driving a dynamo, or break the threads in a spinning machine if the engine were running a mill. For this reason, the percentage of instantaneous, as well as permanent speed variation, should be asked for, if there is good reason for so doing.

TIME OF DELIVERY.—An engine-builder cannot keep a stock of engines, except possibly in small sizes, so that a period must be allowed him to complete his order. Since time is money, the client should ask in his inquiry for a guaranteed time of completion of work, which will obviate any misunderstanding as to what constitutes a reasonable time of delivery, and will enable him to discriminate between a maker whose shops are already too full of work and one who can supply the necessary power, labor and room to get the work through quickly. Such guarantees are, of course, given subject to delay due to strikes, lock-outs, accidents, or other causes not under the control of the engine-maker.

Although the above considerations by no means exhaust the points which have to be remembered in ordering an engine—it would

Digitized by Google

be unfortunate for the consulting engineer if they did—yet if those mentioned were attended to, the confusion of ideas which is apparent in many inquiries would be lessened, and the chances of getting a satisfactory engine much increased.

SOME INTERESTING FAULTS ON TELEPHONE CIRCUITS.*

BY "BUSYBACK."

The presence of electric light mains near telephone circuits frequently causes disturbances in the latter, even though there is no actual contact or leakage between the two circuits.

On one of my visits to a certain small telephone exchange I was surprised to hear a most extraordinary noise on all the telephone lines. By listening on several of the lines, which were run in different directions, the neighborhood of the disturbing cause was

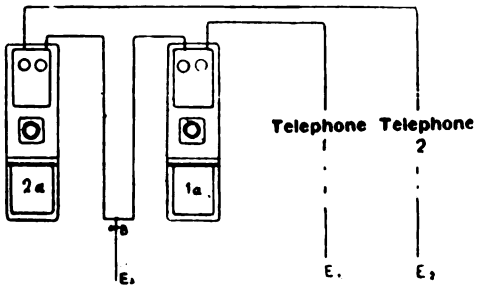


Fig. 1.

located by the increased loudness of the sound. On going to the place indicated, a man was seen drawing over the ground a peculiarly constructed piece of apparatus supported on wheels heavily insulated with rubber tires. Closely following this apparatus was another man carrying and listening at a telephone receiver in connection with the apparatus on wheels. At the central station there was a large induction coil sending a high potential alternating current into the cable. The whole of the proceedings were, of course, to locate the position of a fault in the electric light cable.

What struck me at the time as being remarkable was the fact that although the sound was loudest on lines which earthed near the fault in the light main, yet on lines which

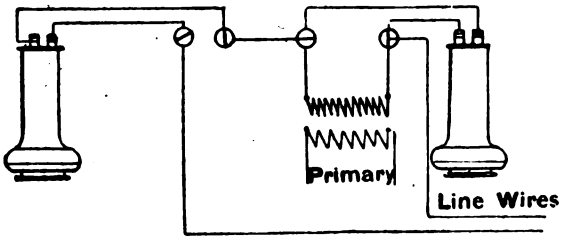

Fig. 2.

were earthed three or four miles on the opposite side of the exchange to the fault, there was sufficient noise to render conversation very difficult; on the lines which earthed near the fault the noise was so loud as to entirely prevent conversation.

Defective or unsuitable material will often cause a great deal of trouble; several instances could be quoted, but one must suffice.

On a certain telephone circuit difficulty was frequently experienced in calling the distant end and in conversing after attention had been obtained. Frequent tests did not reveal this difficulty for some time, as sufficient allowance was not made for a partial earth which was on the line at the time. The fault was eventually located in some underground wire; on this wire being taken up and examined, it was found that the copper had been reduced to a fine powder in several places, caused, no doubt, by some impurity in the ozokerite insulation. The effect of the wire being so reduced to powder was to increase the resistance of the line to such an extent at to shunt so much current to earth through the faulty insulation that sufficient did not reach the distant end to ring the bell.

On single line systems of telephones, faulty earth wires frequently cause overhearing and partial contact. The reason for this will be apparent if Fig. 1 is referred to.

When two or more telephones complete their circuit through one earth wire and any resistance is introduced in it, instead of all the current going to earth at E, a portion of it, depending on the resistance of the earth and of the instruments, will continue along the wire to the second telephone, and through it to earth again at the far end of line 2. If the resistance of the earth is sufficiently high all the bells will ring when one is rung; if it is not high enough only one bell will ring, but speaking will be overheard by any one listening on the other circuit.

A resistance in the earth wire may be caused by the wire being badly soldered to the earth plate or to the water pipe, thus allowing corrosion to set in between the pipe and the wire, or it may be due to the wire being broken at some point and a loose joint being made, which

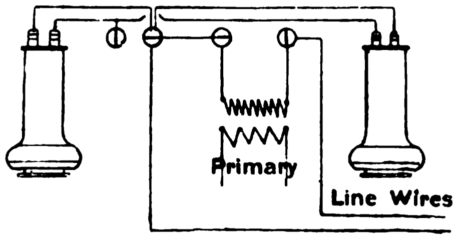

Fig. 3.

soon becomes of high resistance through the oxidation of the wire. In one case two telephones were put into intermittent contact by an ordinary bellhanger's joint being made in the earth wire, evidently by some person who had broken it and joined the pieces together, thinking them to belong to an ordinary bell.

If the water pipe to which the earth wire is soldered is fed from a cistern there will frequently be sufficient resistance introduced to cause difficulty, especially when the cistern is empty or the water is low, through there being no direct metallic connection between the main supply pipe and the pipe from the cistern.

Faulty connecting up of the various parts of an instrument will frequently give rise to peculiar faults. In one case, which has come under my notice, a second receiver was connected to an instrument, and there not being any special terminals on the instrument for this purpose, the receiver was connected in shunt with the induction coil secondary instead of in shunt with the first receiver. The effect of this was that messages could be received all right, but could only be transmitted very faintly, because the current which should have gone to line shunted through the second receiver. (See Fig. 2.) The longer the line the greater would be the proportion of the current circulating through the second receiver, and the smaller the quantity which would reach the instrument at the distant end of the line. The connections should have been as in Fig. 3.

An interesting fault, which caused considerable trouble, was the following: Complaint was made of there being a current on a certain telephone line when the instrument was in use. Several fruitless efforts to find the cause of this trouble were made, till on one occasion it was found that disconnecting the primary circuit also disconnected the secondary circuit. Careful examination showed that the primary and secondary circuits were connected in series as in Fig. 4, and not as they should have been as in Fig. 5. The effects of this careless con-

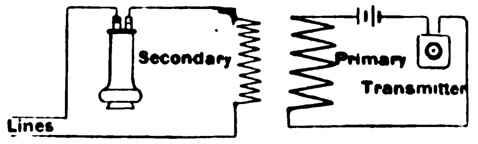

Fig. 4.

necting up were rather curious. While speaking, the current was sometimes strong enough to actuate the ring-off signal, and thus cause the attendant to disconnect the circuits when they should have been left connected. The speaking properties of the telephone were not interfered with to any appreciable extent; at any rate, no alterations of the speaking powers of the instrument were noticed on a short line.

Late one evening I was summoned to a certain fire station where there were a number of bells in the various firemen's rooms. These bells were all in parallel, and fed from one source of current. On my arrival at the station none of the bells would ring; as the source of current was in order, all the lines to the various bells were disconnected in turn, till at last the faulty circuit was disconnected, when the whole of the bells, with the exception of the one on the faulty circuit, rang. It being late, the faulty circuit was left disconnected with the remainder of the bells ringing as usual. Early the following morning the faulty circuit was tested and found to be in order, and the bell rang all right; also on connecting it to the main circuit, it, and all the other bells, rang as usual. On a thorough examination of the circuit which had caused all the trouble it was found that the fireman who inhabited the room in which this bell was fixed had been putting up some new window blind

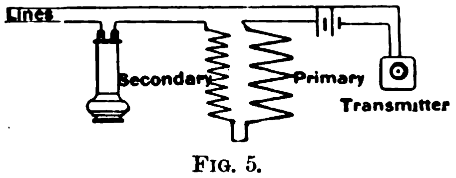

Fig. 5.

fittings: these had chafed through the insulation of the wires where they were brought through the window frame, and caused them to be short-circuited when the window blind was drawn down: thus the whole of the current passed through the short-circuit caused by the blind being drawn at night; consequently none of the bells rang. On the blind being drawn up in the morning the short-circuit was removed, and the bells rang as usual.

A very annoying fault is frequently caused by wires breaking under their coverings. This class of fault is so apt to be intermittent, and everything to be in apparently good working order while being examined. In testing for such faults a low battery power should be employed, not more than two or three cells, as a higher electromotive force is liable to break

*From the "Electrical Review," London.

the fault down and leave the circuit good until it is disturbed.

From the few examples given, it will be seen that telephone circuits are subject to many causes of interruption, especially as only the more interesting or more uncommon causes of interruption have been mentioned.

RATE METERS.*

BY HOWARD HENDRICKSON.

It is universally conceded that to arrive at the proper rate to charge for electric current, two main features are to be considered, viz., the fixed charges (interest and dividends on capital invested, depreciation and general expense account), and the variable charges, which may be called the generating and distributing cost.

The relative value of these two factors vary in every electric plant and with every consumer supplied.

To meet the commercial law that low rates are always conducive to largely increased consumption, and larger output insures reduced cost of production, it becomes imperative that a sliding scale be adopted in charging for current used to insure a universal profit on all customers.

Various devices have been suggested and used to determine what this rate should be in each individual case, notably maximum-demand meters. But these fail because a maximum-demand meter indicates the highest demand made on the station if but once in the whole period between readings; this will readily be seen is an injustice to the consumer if that maximum is used during the period and a charge based accordingly, as there is always one time during a period that a consumer would use more than ordinarily. For example, a contingency might arise during the first part of the period that would render it necessary for him to turn on all the lights in his establishment possibly for not more than thirty minutes; this would force the maximum-demand meter up to its highest point or capacity, there to remain no matter how small a quantity of power is thereafter consumed during the balance of the period; this is a constant source of trouble and dispute between the station and consumer and discourages the customer in freely using electricity.

The record of the demand made by the consumer for one isolated time is no benefit to the station, as isolated individual maximum demands made by several customers would be made at different times and on different days and the station would not be called upon to supply the sum of these demands at one time; but if an individual consumer made repeated demands upon the station, knowledge of this fact would be desirable to fix an equitable rate to offset the increased installation required to meet that demand.

On the other hand, a thorough knowledge of the several rates of consumption made by consumers would make it possible to fix low rates and thereby encourage the use of current over more hours and thus more evenly load the plant and thereby enure to the benefit of the station.

Vibrators are disadvantageous inasmuch as they are not automatic, making it necessary to guess at the amount of current to be used to set them in the first instance, which varies for every month of the year, or devolving on the consumer the necessity of making subsequent adjustments, which, if made in the middle or latter end of the month, causes him to feel overcharged for the first part.

A perfect rate meter must not only be automatic and thereby register the lowest rate demanded, but must not register the maximum rate until that demand has been made a sufficient number of times to make it necessary to set apart a definite portion of the installation to meet that demand. Such a rate meter, in an installation driven by water power, or in other words, where the fixed charges greatly predominate, would meet all wants in a most satisfactory manner. no recording watt-hour meter being necessary in such a case, as by it, proper charges, based on the installation operated to supply each individual customer, could be made.

In plants where the generating and distributing costs are high. a recording watt-hour meter is a necessary adjunct to the rate meter; together they leave nothing to be desired, as by their use the long-hour customer with light demand and the short-hour customer with heavy demand can be singled out and equitable rates, based on costs to the station, made.

Another advantage in the use of a rate meter is keeping down the peak load, which determines the capacity of the plant, thus increasing the efficiency by making it possible to use the peak load margin in supplying more customers and giving greater satisfaction by supplying current at a lower rate per kilowatt-hour.

In ordinary flat-rate contracts based on lamps installed, the consumer limits the number to the smallest amount and to get the full value burns them as long as possible; the station manager must combat this tendency by a high rate; the result is small business and high peak loads.

In contradistinction where rates are based on average demand, houses are more liberally wired, and where the convenience is at hand the tendency is to use it, and with the better rate a better satisfied and more profitable customer accrues to the station.

It is believed that a device which will meet all foregoing requirements which are essential to a perfect rate-indicator has now been devised and is described in U. S. Letters Patent No. 640,466, issued to Jesse Harris, January, 2 1900. It consists of a solenoid within the open interior of which is drawn a laminated core of iron by the current traversing the coil; the pull on the core is opposed by a weight carrying a pointer in front of a scale arranged by means of a pawl and rack to travel out on an arm. It operates as follows:

When the pull of the solenoid is sufficient to overcome the weight the arm will raise and the pawl attached to the weight will advance one notch in the rack; in this position the meter will be in position upon decrease or shutting off of current to advance one point and register: this operation is repeated at each subsequent time that the current reaches a magnitude greater than last registered. After reading, the meter is reset by sliding the weight to its original position.

The meter here described is a simple mechanical device not liable to get out of order and for accuracy can be relied upon.

*Paper read at the Fourth Annual Transmission Convention, held at Mount Tamalpais, Cal., June 19-20, 1900.

A New Electric Meter.

A new variety of electric meter, or indicator, has been devised, which works on an entirely new principle. In all electric light and power installations meters, not of the registering type like a gas meter, but indicators, much like the pressure guage on a steam boiler, are used to indicate the condition of the current output as regards volume and pressure. These have almost invariably worked on some principle involving the magnetic effect of the current, and have been generally very delicate and complex in construction as well as expensive. For large stations where great volumes of current are to be measured, or wherever high electrical pressures are used, their use has not been attended with the greatest satisfaction by reason of certain inherent defects. The new type of meter employs auxiliary power in the shape of compressed air. to move a column of liquid in a tube, this being the visible indicator of the instrument. while the delicate magnetic parts are used only to regulate the flow of the air. A small motor of the size used to drive the ordinary electric fan is used to work a little pump and compress air to about three or four pounds to the square inch pressure. This air flows into a receiver connected with a glass tube and a reservoir of oil, so that the height at which the oil stands in the tube is a measure of the pressure of the air. From this receiver the air escapes through a little safety valve, to which are attached the delicate coils of the instrument. Variations in the strength or pressure of the current measured, as the case may be, cause these coils to exert a correspondingly heavier or lighter pressure on the safety valve, which is constantly blowing off. Hence the variations of the current appear as corresponding variations of the air pressure in the receiver, and of the height of the column of oil. As the current measured has practically no work to do, merely to control the valve, very small current variations can be made to show as large changes in the height of the column, which is highly desirable.

Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended August 11:

Antwerp, 4 cases, $986; 50 packages, $4,895; Argentine Republic, 220 packages, $11,099; 69 cases, $3,931; 18 packages motors, $893; 2 crates automobiles, $737; Australia, 107 cases, $5,475; Berlin, 1 case, $25; Bremen, 1 package, $11; Bordeaux, 6 cases, $150; Brazil, 20 cases, $828; British Guiana, 4 cases, $145; British West Indies, 14 cases, $213; other British Possessions, 88 packages, $4,066; Bristol, 37 cases, $7,000; 18 reels electric cables, $2,438; Budapest, 1 case, $41; Central America, 2 cases, $55; Chili, 104 packages, $2,493; Cuba, 36 packages, $737; Ecuador, 6 packages, $252; Glasgow, 81 cases, $39,-415; 81 reels cable, $33,393; 2 packages trolley poles, $130; Gothenburg, 2 boxes, $120; Hamburg, 41 packages, $15,676; 1 case, $50; Havre, 235 packages, $29,585; Hull, 6 packages, $602; Leeds, 8 packages, $166; Liverpool, 3 packages, $19; 3 boxes motors, $555; London, 672 packages, $50,928; 10 packages automobiles, $1,500; 27 packages motors, $1,041; 283 trolley poles, $12,222; 17 cases, $766; Madrid, 12 cases, $1,618; 216 trolley poles, $8,000; Manchester, 4 boxes, $5,165; Mexico, 25 packages, $2,667; Peru, 49 cases, $2,810; Porto Rico, 836 packages, $1,653; Santo Domingo, 4 boxes, $52; Southampton, 17 cases, $1,130; St. Petersburg, 4 cases, $2,019; Stockholm, 1 case, $110; Uruguay, 8 packages, $920; U. S. Colombia, 15 packages, $975; 10 cases, $258; Venezuela, 3 cases, $76.

CANADIAN NOTES.

(From our Ottawa Correspondent.)

Mr. Edwin Hanson, president of the Havana Electric Railway Company, has just returned from New York to Montreal. He has been in the former city looking after matters pertaining to the enterprise. The Havana Electric Railway Company, which has taken over the property of the Ferro Company, has now in course of construction about 80 miles of track, and the company proposes to operate on its system about 120 cars.

Mr. William Kennedy, C. E., of Montreal, has returned from a trip to Europe. He has been abroad for the purpose of attending the shipment of turbines for which he had contracted with a Switzerland firm last fall. The turbines are for the Cataract Power Company of Hamilton, Ont., and are to be used under the head of 267 feet of water in the transmission of power from St. Catherine's to Hamilton, a distance of 34 miles. Mr. Kennedy went to Austria, France and other European countries, but found that in Switzerland the people were furthest advanced in the utilization of water under high heads.

At a meeting of the Cape Breton Tramway and Electric Company recently held at Sydney, B. C., it was decided to build an electric railway in the town of Sydney and suburbs, to engage an engineer and, as soon as proposed routes will be surveyed, to commence the construction of the tramway. A committee was appointed to consider the advisability of extending the line to Glace Bay. The construction of the line between North Sydney and Sydney mines was considered but not decided on. The company is capitalized at $500,000.

Mr. J. B. Charleson of Ottawa, who is building the Dominion Government telegraph line to the Yukon, says that the section from Atlin to Telegraph Creek, a distance of 222 miles, is completed. The section from Tagish to Atlin, 80 miles, was previously built, which makes a total of 302 miles of wire in the northern end. To the south, wires have been strung from Quesnelle to Hazleton, 342 miles, leaving 300 miles between the two inside ends of the wires. A connection will be made about the end of September or early in October. About the same time connection will be made with the line into Dawson City. In the meantime communication with that city is kept up on the interspaces north and south, by relays of horses. The line from Quesnelle to Ashcroft, a distance of 220 miles, is being repoled. Branches are to be put to Hoselly, 72 miles, and from French Lake to Manson Creek, Omenica.

When the electric lines now being built by the Niagara, St. Catherines and Toronto Electric Railway Company are completed, the Greater Buffalo-Niagara District will have the best system of electric railways in the world. This company is building on the Canadian side of the Niagara River and it will work in conjunction with the International Traction Company, which now affords such a fine service. Work is progressing rapidly, and in a few weeks the Canadian company will have all its lines operated. The company, some time ago, purchased the franchise of the Niagara Central Railway, between Niagara Falls, Ont., and St. Catherines, as well as the Niagara Falls road between that town and Niagara Falls South. The company is rebuilding the roads with new materials throughout.

"The Bird is on the Wing."

When the great Persian poet wrote the above line, he had no idea of applying it to a Pullman car, but the poet of the Pullman Company who names the cars seems to have adopted this idea, as the latest examples of Pullman design in parlor cars have just been delivered to the New York Central, and their names are Raven, Starling and Robin. They will be placed in service on the Empire State Express within a few days, and are as handsome as cars can be. It is difficult to add to the popularity of this most famous train, but if it can be done the Pullman people intend to do it, if the handsomest cars that can be built will accomplish that result.—From the Utica Daily Press.

LEGAL NOTES.

The Canadian General Electric Company of Toronto recently brought suit against the Toronto Railway Company for damages and an injunction to prevent the latter company from manufacturing certain electrical machinery upon which the plaintiff company say it holds four patents. The patents are on series parallel controllers and improvements on controllers for electric motors.

Papers in a suit have been filed with U. S. Circuit Clerk Williams of Buffalo, N. Y. The suit is entitled "The Electric Vehicle Company of New Jersey vs. the Buffalo Gasoline Motor Company." The Electric Vehicle Company claims serious infringement of patent rights. The letters patent concerned in the case are No. 549,160, and were granted in 1895 to George B. Selden of Rochester, N. Y., who is co plaintiff.

PERSONAL MENTION.

Mr. C. E. Flech, who was recently employed in the electrical business in Schenectady, N. Y., has lately accepted a position as superintendent of an electric light station in Cuba.

Mr. Nelson Perin, president of the United Railways & Electric Company of Baltimore, Md., returned to that city recently after an absence abroad of about three months.

INCORPORATIONS.

The Washington Electric Fountain & Supply Company, Trenton, N. J. Capital stock, $100,000.

The Paraguay Development Company, Philadelphia, Pa. —to open up and develop the natural resources of South American countries, especially of the Republic of Paraguay; to provide for electric and other lighting plants. Capital stock, $500,000.

The Automatic Electric Works, Des Moines, Ia. Capital stock, $5,000 Incorporators: E. I. McGorrisk, Pauline J. Rotermund and P. H. Ryan.

The Electric Fire Engine Company, Portland, Me.—to deal in electrical fire engines and electrical apparatus for extinguishing fire. Capital stock, $5,000. Incorporators: Walter A. Morgan, Ernest O. Hiller and Llewellyn Carlton.

The Susquehanna Valley Electric Company, Albany, N. Y. —to operate in Delaware County. Capital stock, $200,000. Directors: Henry B. Oakman and Edwin H. Tucker of Brooklyn, Charles F. Lehman of Smithtown, and C. C. Higgins of Bedford.

The Crouse Hinds Electric Company, Syracuse, N.Y. Capital stock, $10,000. Incorporators: H. B. Crouse, J. L. Hinds and J. A. Hopper, all of Syracuse.

The Middleburg & Schoharie Electric Light, Heat & Power Company of Middleburg, N. Y.—to manufacture electricity for light, heat and power in Middleburg and Schoharie. Capital stock, $40,000. Directors: Daniel D. Frisbie, G. N. Frisbie and Dow Beekman, Middleburg.

ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U. S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL. Nos. 302-304 Broadway, New York City. N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

LETTERS PATENT ISSUED AUGUST 7, 1900.

ELECTRIC RAILWAYS AND APPLIANCES.

655,216. Switch for Suspended Electric Conductors. John Floyd, Washington, D. C. Filed Dec. 8, 1899.

655,217. Crossing for Suspended Electric Conductors. John Floyd, Washington, D. C. Filed Dec. 8, 1899.

655,389. Safety Device for Electric Vehicles. Frank E Case, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed May 20, 1899.

655,455. Electric Railway. William B. Purvis, Philadelphia, Pa. Filed April 24, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

655,176. Electric Arc Lamp. Johann F. Ackermann, New York City. Filed Oct. 20, 1899.

655,266. Electric-Arc Lamp. John S. Nowotny, Madisonville, O. Filed July 12, 1898.

655,526. Electric-Arc Lamp. Thomas Spencer, Philadelphia, Pa., assignor to the Helios Upton Company, same place. Filed May 14, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

655,237. Apparatus for Transforming Alternating Currents into Continuous Currents, and Vice Versa. Maurice Hutin and Maurice Leblanc, Paris, France. Filed April 28, 1899.

655,249. Telegraphic Typewriter. Reinhold Kubler, Berlin, Germany. Filed Aug. 29, 1898.

655,268. Electric Motor. Ernst G. P. Oelschlager, Charlottenburg, and Carl O. F. Schrottke, Berlin, Germany, assignors to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Dec. 27, 1897.

655,276. Measuring Instrument. Franz Schrottke, Berlin, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Nov. 18, 1899.

655,335 Motor-Starter. Ethelbert M. Frazer, San Francisco, Cal., assignor, by mesne assignments, to the Otis Elevator Company of New Jersey. Filed March 11, 1899.

655,336. Controller. Ethelbert M. Frazer, San Francisco, Cal., assignor, by mesne assignments, to the Otis Elevator Company of New Jersey. Filed July 20, 1899.

655,340. Starting Device for Electric Motors. Johannes H. F. Gorges, Berlin, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Dec. 31, 1897.

655,353. Meter. Carl O. F. Schrottke, Berlin, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Dec. 27, 1897.

655,412. Circuit Closer. Jeremiah O'Meara, New York City. Filed May 20, 1899.

655,491. Electrically-Driven Machine. Theodore H. Joseph and James J. Ehrenreich, New York City. Filed Jan. 27, 1899.

TELEPHONES AND TELEPHONE APPARATUS.

655,620. Telephonic Apparatus. Alfred Graham, London, England. Filed Oct. 17, 1898.

655,651. Multiplex Telephony. Ernest A. Faller, San Francisco, Cal., assignor of one-half to James W. Chisholm, same place. Filed April 27, 1900.

MISCELLANEOUS.

655,195. Gramophone Sound-Box. George K. Cheney, New York City, assignor to the National Gramophone Corporation, same place. Filed Oct. 18, 1899.

655,203. Telegraphic Transmitter and Receiver. Albert C. Crehore, Hanover, N. H., and George O. Squier, Fortress Monroe, Va. Filed June 7, 1899.

655,219. System of Electrical Distribution. Emmerich E. Frischmuth, Berlin, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Oct. 2, 1899.

655,225. Magazine-Phonograph. George V. Gress, Atlanta, Ga. Filed April 12, 1898.

655,238. Process of Transforming Alternating Currents into Continuous Currents, and Vice Versa. Maurice Hutin and Maurice Leblanc, Paris, France, assignors to the Societe Anonyme pour la Transmission de la Force par l'Electricite, same place. Original application filed April 28, 1899. Divided and this application filed May 29, 1900.

655,239. Process of Bleaching by Electrolytic Chlorin Water. Thomas Jespersen, Neenah, Wis. Filed May 29, 1899.

655,264. Sign or Signal for Calling Cabs. Arthur G. R. Nichol, New York City. Filed Sept. 1, 1899.

655,265. Electric Cable. George H. Nisbett, Huyton, England. Filed Dec. 28, 1897.

655,289. Igniter for Explosive-Engines Louis Witry, Waterloo, Ia., assignor to the Waterloo Gasoline Engine Company same place. Filed Dec. 16, 1899.

655,317. Electric Temperature-Indicator. Leslie S. Wilder, Springfield, Mass. Filed Nov. 18, 1899.

655,341. System of Alternating-Current Transmission. Johannes H. F. Gorges, Berlin, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Oct. 11, 1899.

655,343. Electrolytic Cell. James Hargreaves, Widnes, Eng. Filed Jan. 31, 1899.

655,368. Electrical Battery. Charles E. O'Keenan, Paris, France. Filed Dec. 30, 1897.

655,406. Electric Sparker for Gasoline-Engines. John G. MacPherson, Philadelphia, Pa., assignor to the MacPherson Automobile Company of New Jersey. Filed Nov. 22, 1899.

655,411. Electrical Detector for Heat or Cold. Jeremiah O'Meara, New York City. Filed May 12, 1899.

655,427. Burglar or Fire Alarm. Franklin D. Wallace, Wheatland, Ind. Filed Oct. 20, 1899.

655,433. Magnetic Separator. Charles F. Courtney and Robert Butterworth, Broken Hill, New South Wales. Filed March 19, 1900.

655,476. Electric Lock. Henry G. Carleton, New York City, assignor to the Carleton Electric Company, same place. Filed Nov. 28, 1899.

655,480. Phonographic Reproducing Device. Thomas A. Edison, Llewellyn Park, N. J. Filed May 3, 1900.

655,562. Brake for Electric Motors. Charles A. Lindstrom, Chicago Ill., assignor, by direct and mesne assignments, to the Hewitt-Lindstrom Motor Company, same place. Filed May 5, 1899.

655,563. Electric Carriage. Charles A. Lindstrom, Chicago, Ill., assignor, by direct and mesne assignments, to the Hewitt-Lindstrom Motor Company, same place. Filed March 3, 1900.

655,671. Electric Conductor for Exercising Apparatus. Alfred M. Crooker and Frank N. McDonald, Boston, Mass., assignors to the Galvanic Health Exercising Company of South Dakota. Filed March 10, 1900.

DESIGN.

33,054. Connector for Electric Wires. Clarence D. Platt, Bridgeport, Conn. Filed June 12, 1900. Term of patent 7 years.

Digitized by Google

THE TELEPHONE WORLD.

Stock of the New York 'Phone Company Increased.

A special meeting of the stockholders of the New York Telephone Company was held on the 8th inst. for the purpose of considering a proposition to increase the capital stock from $16,000,000 to $30,000,000. One hundred and fifty-nine thousand nine hundred and seventy shares out of 160,000 were represented at the meeting, and a resolution to increase the capital stock to the amount named was carried unanimously. Thomas F. Clark, vice-president of the Western Union Telegraph Company, and who is also a director of the New York Telephone Company, said after the meeting that so far as he knew the increase was not made for the purpose of absorbing any other telephone companies

"I presume," he said, "that the additional capital will be used in the regular course of the company's business." Mr. Clark added that he knew of no project to extend the operations of the company outside the city.

The purpose of the company in almost doubling its capital stock, it is generally assumed, is to provide it with resources to fight the Telephone, Telegraph & Cable Company of America, which was recently formed to compete with the New York Telephone Company. The new organization is backed by several prominent capitalists, and their avowed purpose is to break down the monopoly in this city which the older company possesses.

The line of the Louisa Telephone Company between Richmond and Louisa, Va., was formally opened on August 1. Richmond is now connected with Gordonsville, and in a few weeks the line to Charlottesville from Gordonsville will be complete. There is only a small gap between Charlottesville and Staunton. From Staunton there is a line to Clifton Forge and Covington, almost at the West Virginia line, and down the valley as far as Harrisonburg, in Rockingham County. Lexington, Buena Vista and Natural Bridge are also on this line. Of course, all these independent lines are used by subscribers free of charge. Long-distance conversation is charged for.

The Pennsylvania Telephone Company has a force of men at work placing poles and stringing wires at Mt. Gretna, Pa., for the use of the National Guard encampment. An instrument has already been placed at division headquarters, and one 'phone will be placed at each of the three brigade headquarters, at the cavalry and artillery camp headquarters, making a total of six telephones. These instruments will constitute a system in itself with outside communication.

Telephone subscribers in Decatur, Ga., are highly elated over the fact that they now have a Bell telephone exchange of their own. Heretofore, all telephonic communication in that town was effected through the Atlanta main office, but now all connections will be made in the Decatur office. Recently the growth in subscribers in the vicinity of Kirkwood and Decatur has been such as to seriously overcome the lines and render any additional growth an economical impossibility.

The People's Home Telephone Company of Birmingham, Ala., is hard at work putting in its system, according to the franchise granted by the mayor and board of aldermen of that city. Four miles of poles are up and $40,000 worth of material has been contracted for.

The Cumberland Telephone Company has increased its toll rates from Lynnville to Murfreesboro, Nashville, Columbia, Lewisburg, Mt. Pleasant, Tenn., and a number of smaller places. But a small sum was added to the usual rates, and the change went into effect about ten days ago.

The prospects are that the Georgia Telephone Company of Savannah will build a long distance telephone line from Savannah to Macon via Dublin, Ga. Mr. J. D. Persons of the Dublin Telephone Exchange when in Savannah was informed that the line would probably be built at an early date.

The Gainesboro Telephone Company is improving the line between Gainesboro and Carthage, Tenn. Four through lines are being added. A line was established from Granville to Enigma.

Manager J. Luther Williams of the Tifton (Ga.) Telephone Exchange has about perfected arrangements for a local exchange at the town of Adel, between Tifton and Valdosta and has already about forty members.

The board of public works of Hudson, N. Y., has given notice to all the telegraph and telephone companies in that city that their poles must be painted within 60 days or they will be taken down.

The Duluth (Minn.) Telephone Company (Bell) announces the completion of connections with towns as far east as Ashland, Hurley and Ironwood and intermediate points.

The Ways of the Bell.

About a year ago when the Binghamton Telephone Company was agitated, and subscribers for it were being secured, says the "Republican" of Binghamton, N.Y., the Bell Telephone Company, through its solicitors visited nearly every office and business place and most residences in the city which had not a telephone, offering to put in the following two kinds of 'phones: $12 per year limited to 15 calls a month and five cents for every call in excess of that number; $1 per year and five cents per call with a guarantee of one call a day or fifty cents a month as the case might be. This was the scale price, but in nearly all cases the guarantee was not required and the service was not limited to a certain number of calls as in the first.

Now that certain aldermen have succeeded in holding up the Binghamton Telephone Company franchise a higher scale of prices has been inaugurated by the Bell Company in that city. A week ago several solicitors armed with a newly prepared scale of prices began to visit the places where the contracts made a year ago had expired and the rise in price was announced. As a result many who before had availed themselves of the service of the company refused to have the 'phones installed at the new price.

The new scale of prices adopted does away with the $12 'phone and leaves as the next lowest the open ring at $18 for residences and the four party call 'phone at $24, both for a three year contract, or $30 for a one year contract.

The prices now prevailing are: Business 'phones, direct, $72, two party select $60, four party $42, four party open ring, $36; residence, direct, $30, two party $27, four party $24, open ring, $18; nickel in the slot 'phone, $1 per year and five cents per call, and thirty calls per month guarantee. All the above prices are net, and with the exception of the last one are for a three year guarantee. Higher prices prevail for a contract of a year at $30 for the four party 'phone, which for a three year contract is $24. No unlimited residence service will be furnished for less than a three year contract for less than $30 a year.

Those who installed the $12 'phones and the nickel in the slot at $1 per year, are the ones who will be deprived of the use of the company's service as the one year contracts are now running out, and the cheap telephone service which the people were promised by the Bell Company is becoming a thing of the past.

Telephone Development in the New England States.

The annual report of the Boston and New York Telephone & Telegraph Company gives some interesting statistics on the development of the independent telephone movement in the New England States. President Charles E. Adams, at the recent annual meeting, said that contracts with 5,500 subscribers covering periods of five years had been made for the use of the exchange, which is now being built in Boston.

"During the past year," he said, "a large amount of preliminary work has been accomplished for the establishment of a telephone exchange in Boston and other cities and towns in Massachusetts, together with the construction of a toll line between the cities of Boston and New York. A large proportion of our subscriptions are for commercial purposes, showing that business men believe that the best telephone service can be obtained at much lower rates than now exist.

"Rights of way have been acquired from Boston to New York for the purpose of building a toll line between those cities, embracing the best construction, together with the latest improvements in telephony. We have secured telephone franchises and rights of way in 55 cities and towns in New England, and a model exchange has been constructed in Stoughton, Mass."

The Boston and New York Telephone & Telegraph Company is one of the sub-companies controlled by the Telephone, Telegraph & Cable Company of America. The officers and directors are: President, Charles E. Adams; secretary, John B. Stauffer; treasurer, Oakes Ames, all of Boston; W. H. Eckert, H. E. Gawtry, W. J. Latta, Charles W. Morse, Martin Maloney, Frank Tilford, all of New York; Frank Cutting, Z. Swift Holbrook and Arthur S. Temple of Boston; Wm. F. Hallstead, Scranton, Pa.; J. B. McCall, Philadelphia, and J. L. Wolcott, Dover, Del.

The Henry County Telephone Company of New London, Ia., has decided to build a line to Mt. Union and has sent in an order to Minneapolis for poles, which are expected to arrive soon. The route extends north along the Winfield road in Scott township, and thence east to Mt. Union, covering a distance of twelve miles.

The Hampden Automatic Telephone Company has lately been granted a franchise in Chicopee, Mass. The company has secured a franchise in Springfield, and a petition in Westfield, Mass, is pending.

Western Farmers Use Telephones.

A system of toll line telephones with local exchanges on a co-operative plan is rapidly covering the whole of Northeastern Kansas. The telephone has come to be regarded as a necessity by the farmers there, but in its practical workings it is benefiting St. Joseph and not Kansas City.

The Interstate Telephone Company's last card shows 172 toll stations in Kansas, Missouri, Nebraska and Iowa, the proportion being in the order of the names of the States. It has spread out over Northwest Missouri until there is scarcely a town in the old Platte purchase and along the railroads north and east of St. Joseph that does not have its telephone, while in Doniphan, Brown, Nemaha and Marshall counties in Kansas, every town has its telephone toll station, and every town of 500 people has its local exchange. These people are now demanding a line to Kansas City and it may be worth while for Kansas City to help them. The Missouri and Kansas Telephone Company has toll stations at some of the larger of these towns.

Sabetha in Nemaha County has 1,000 people and more than 100 telephones. Most of them run to houses on the townsite, but every rich farmer within five miles has his telephone. The company is a local mutual concern and the farmers, of course, have to bear the expense of extending the lines to their farms. There is scarcely a business man in the town who does not order goods by telephone, and because he can order them by telephone from St. Joseph and not from Kansas City, St. Joseph is getting business Kansas City would get but for the telephone.

Fairview has less than 400 people. It has a little local exchange for the people in the town, but is rapidly extending into the country. A shipper of stock who lives two miles from the town recently told how he watched the cattle market. He said, "When cattle are ready to ship, we take them off water in the morning and along in the afternoon call up St. Joseph. It only costs a quarter and the telephone is in the house, so all we have to do is make the call for St. Joseph after dinner and in two or three minutes are connected through. Then I can talk to the commission house in St. Joseph and get the latest market information. If conditions are favorable I ship that night; if not, I hold the stock till the next day or the next, and ship when the market is good on the strength of advices over the telephone."

A. W. Bisbee of Jacksonville, Fla., who was so successful in introducing an independent telephone system in Savannah, Ga., despite the bitter fight made against him by the Bell Company, has applied for a franchise in Macon, Ga. The city council is in favor of granting it. The Bell Company fight the opposition.

Eastern capitalists have purchased the stock of the Tri-City Telephone Company of Clinton, Ia., and will extend the line which is now operative in three counties. It is thought that the National Telephone Company, which was recently incorporated at Trenton, N. J., is back of the deal and is after the business of the Bell Company.

The Bell Telephone Company of Buffalo, N. Y., is still being submitted to a great deal of trouble through the actions of late employes, who were discharged when the strike was declared. Almost every day communication on some of the lines is interrupted by reason of the alleged destructive propensities of the strikers.

An independent telephone company has received the material for the construction of a line from Bucyrus to Plankton, O. The work is now under way.

Whitwell, Tenn., will soon have two telephone exchanges. One is being built by the East Tennessee people and the other by the Dixie Telephone Company.

The Bell and Mutual telephone systems at Vicksburg, Mich., have been consolidated, the former company succeeding to the business.

The People's Telephone Company of Shelby, O., lately creased its capital stock from $35,000 to $50,000.

TELEPHONE INCORPORATIONS.

The National Telephone Equipment Company, Detroit, Mich.—to manufacture and sell telephones, etc. Capital stock, $100,000. Incorporators: H. O'Connor, E. H. Parker, both of Detroit; W. O. Sterling, Jr., of Monroe.

The New Concord Telephone Company, New Concord, O.—to construct and operate a telephone line. Capital stock, $10,000. Incorporators: L. I. Graham, O. M. Shipley, S. W. Lorimer, T. J. Racer and J. B. Bain.

The Franklinville Telephone Company, Franklinville, N. Y. Capital stock, $10,000. Directors: C. R. Randall, R. S. Litchfield, and G. W. G. Ferris, all of Franklinville.

GENERAL NEWS.

What is Going On in the Electrical World.

LIGHTING.

Anniston, Ala.—The Anniston Manufacturing Company has awarded the contract for a complete electric light equipment for their cotton mill. An equipment sufficient for 450 lights will be put in.

Bergen, N. Y.—O. R. Bissell, of Cleveland, has succeeded in obtaining from the village fathers a franchise to erect, maintain and control an electric light plant in this village, with its accompanying accessories, poles and wires for a period of 25 years.

Billerica, Mass.—The citizens voted last week to take preliminary steps for establishing an electric light plant for this town. The present plant will be purchased.

Bradford, Pa.—It it reported that Bradford is trying to buy an electric light plant.

Cattaragus, N. Y.—The new electric light plant is rapidly progressing. The plant is to be run by water power and a dam covering nine acres is being built. The work is under the supervision of Mr. Setter of North Collins.

Clayton, Ala.—This place contemplates the erection of an electric light plant.

Crisfield, Md.—The Crisfield Ice Manufacturing Company will erect an electric light plant, provided the council will grant a proper franchise and will award the company the contract for municipal lighting. Dr. G. T. Atkinson, president.

Egg Harbor City, N. J.—During a recent thunder storm lightning struck the power house of the electric light company, completely demolishing the dynamo.

Elmore, O.—Fort Wayne capitalists want to put in an electric light plant here, providing the town will contract for 12 arc lights of 1,200 candle power for $700 per year for a period of ten years.

Franklin, O.—The village council is getting figures on the cost, etc., of a municipal electric lighting plant for this place.

Georgetown, Ky.—The Georgetown Electric Light, Water & Power Company, which was sold at receiver's sale recently, was purchased by R. W. Nelson for $30,000.

Grand Island, Neb.—The committee on lights has recommended an appropriation of $5,000 for installing an electric light plant in the waterworks pumping station. Ed. Hopper, city clerk.

Greenwood, Ind.—This city contemplates the erection of an electric light plant. G. W. Carpenter, city clerk.

Hailey, Idaho.—A $30,000 electric light plant is proposed for this place. W. T. Riley is the promoter.

Ilion, N. Y.—Messrs. Heacock, Van Deusen and Morgan are a committee having in charge the erection and installing of the new municipal electric light plant at this place.

Kirkwood, Mo.—The municipal committee of this place has been authorized by the board of aldermen to purchase the lot on which the proposed municipal lighting plant will be erected. City Clerk Hawken will advertise for bids for the sale of city bonds to the amount of $17,000. Owen Ford, of St. Louis, is drawing up the plans.

Laurel, Md.—The water board has about determined upon the location of the supply dam for the water system for this town, and the purchase of the local electric light plant has also been considered desirable.

Lewiston, Idaho.—The Lewiston Water & Light Company will spend about $20,000 in improving its electric light plant. F. W. Kittenbach, president.

Lockport, N. Y.—A change in the system of lighting will be made by the substitution of electricity or gas in place of the oil lamps now used.

Lowell, Mass.—The Lowell Electric Light Company has voted to increase its capital stock from $300,000 to $400,000.

Marlborough, N. J.—Plans are being prepared for the new electric light plant to be erected at this place.

Mayville, Mich.—The electric light plant at this place was recently burned. Loss about $10,000.

New Castle, Pa.—The city council has adopted a measure providing for the establishment of a municipal electric light plant.

North Adams, Mass.—The North Adams Gas and Electric Light Company is about to build a substantial addition to its electric light plant.

Oskaloosa, Ia.—Bids are asked until August 20 for lighting this city for from five to fifteen years, requiring about 50 2,000 cp. arc, and 50 32 cp. incandescent lights. Address C. E. Munroe, city clerk.

Pensacola, Fla.—Bids are asked until August 31 for lighting the streets and alleys of this city for three, five, or ten years from January 1, 1901. Address F. Glackmeyer, clerk.

Perry, Ia.—T. A. Grist of Cedar Rapids, County Auditor G. R. Lyon and Harley B. Brown of this city have purchased the electric light and heating plant from Messrs. Frank Dodson and John R. Swearingen. The consideration was $60,000. The new owners expect to take charge of the plant about September 1.

Philadelphia, Pa.—The Philadelphia Electric Light Company will raise $2,500,000 by assessment and improve and extend its system. A. J. De Camp, manager.

Poughkeepsie, N. Y.—It is suggested that electricity be installed as an illuminant in School No. 8, as every year the school is used as a polling place, and at the time of its use artificial light must be resorted to at the opening of the polls on election day, and after 4 o'clock on election and registry days. The use of oil on these occasions is not only inconvenient but antiquated.

Rio, Wis.—This place is to have an electric light plant. O. Ingram has been granted a 25 year franchise.

Roseburg, Ore.—A company will soon be incorporated here with $150,000 capital stock for the purpose of building an electric light plant.

Saginaw, Mich.—The proposals for erecting a municipal lighting plant for this city recently received are to be rejected by the board of public works and an engineer may be employed to draw up new specifications and new bids advertised for.

Shamokin, Pa.—The question of erecting an electric light plant here is being discussed by the city council.

St. Louis, Mo.—The Missouri-Edison Electric Company has lately announced a reduction in price of the standard incandescent lamp to twenty cents, and with the end of its service to this city, September 1, will have a large additional station capacity that it will offer to the public at very low prices and under exceptional conditions.

Wallingford, Conn.—R. Wallace & Sons are to have their own electric light plant, and will put in 1,000 lights.

West Plains, Mo.—This city contemplates the erection of an electric light plant.

Winchester, Ore.—A company has lately been organized here with a capital of $150,000 for the purpose of utilizing the water power at this place. An electric light plant will be one of the enterprises taken in hand by the company.

Yardley, Pa.—During a recent storm lightning damaged the electric light plant here.

STREET RAILWAYS.

Alexandria Bay, N. Y.—Eleven prominent business men of Plessis have recently conferred with the officials of the Electric Railway Company in regard to extending the proposed road from the Bay to Redwood through to Plessis. The town is three miles distant from Redwood and is a center of freight traffic for a large community.

Brookfield, Mass.—The selectmen have signed a franchise for an electric railway from here to Gilbertville. The State has appropriated $5,000 for the State road in Gilbertville.

Charleroi, Pa.—A movement is on foot to build an electric road from here to Washington in this State.

Decatur, Ind.—James McHaney of Cincinnati is here in the interest of capitalists of that city who want to construct an electric road between this city and Fort Wayne, a distance of 22 miles.

Detroit, Mich.—The International Construction Company of this city was lately awarded the contract for building the Flint, Saginaw & Bay City Electric Railway. It will be 50 miles long and will use the third-rail system. The contract is with the Saginaw Suburban Railway. Price, $800,000.

Far Rockaway, N. Y.—The citizens of this place are backing up a petition of the railroad company for the extension of the Ocean Avenue trolley line from its present terminus on the Far Rockaway inlet at the foot of Broadway to the outer beach.

Grand Rapids, Mich.—An electric railroad from here to Grand Haven and Muskegon is to be built at once. The company has completed organization here with J. D. Hawks president, and W. Franklin treasurer. The railway will cost $1,500,000.

Hartford, Conn.—The Connecticut Lighting & Power Company have secured right of way for a new trolley line from Waterbury to Southington. The object of the company is to have a line from Naugatuck to Waterbury, from Waterbury to this city by way of Southington and New Britain.

Lima, O.—The Lima Railway Company of this city has increased its capital stock from $200,000 to $500,000, and changed its name to the Lima Electric Railway & Light Company.

London, O.—The Columbus, London & Springfield Railroad Company was lately granted a franchise by the commissioners to build an electric railway through Madison County.

Marcellus, N. Y.—Work is being pushed on the new electric road which is being built from here to Otisco Lake. The company has promised to have the road completed and the cars running by the first of October, and the indications are that this will be done.

Miamisburg, O.—The Miamisburg & Germantown Traction Company of this city was lately incorporated for $50,000 by W. A. Mays, C. W. Dodds, S. H. Mays and A. F. Gwin. The company will build an electric railway from Germantown to Miamisburg.

Newport News, Va.—It has been announced that the Citizens' Light & Power Company will complete the electric railway between this city and Hampton, which was started by the defunct Peninsula Railway Company.

Northville, Mich.—People all along the proposed extension of the Detroit, Plymouth & Northville Electric Railway from here to Walled Lake are extremely anxious for the road.

Novi, Mich.—This town is to have an electric railroad in the near future.

Peru, Ind.—F. C. Boyd of New Haven, Conn., who has been anxious to build an electric line between Wabash and this city has again taken up the matter.

Preston, Minn.—The Ohio Trust Company has submitted to the business men of this place, a proposal for the building of an electric railway from Decorah, Ia., to Chatfield, Minn., via Preston. The road if built will give Preston connection with the Burlington, Cedar Rapids & Northern, on the south, and with the Chicago & Northwestern on the north.

Taunton, Mass.—The air line electric railroad promoters who have laid out a direct route from this city to New Bedford intend to begin operations early in the spring. The running time to New Bedford will be about an hour and a quarter.

Upland, Pa.—The borough council has granted the right of way in this place to the Media, Middletown, Aston & Chester Electric Railway Company.

Weyauwega, Wis.—The survey of the electric line between Berlin, Waupaca New London, Wautona and this city will begin this month. The road will be built by a stock company composed of Chicago railroad men and when completed will have cost over $600,000. A. L. Hutchinson of this place is the chief promoter of the deal.

Yantic, Conn.—The contract for the new electric railroad from here to Baltic has been given to Boston parties.

MANUFACTURING.

Ft. Wayne, Ind.—The articles of incorporation of the new Belden-Larwill Electric & Manufacturing Company were received a short time ago and the company is now prepared to do business on a large scale.

Peru, Ind.—The Peru Electric Manufacturing Company of this city has sold the carbon department of the industry to the National Carbon Company of Cleveland, O., and the machinery will be removed to that city at once.

Pittsfield, Mass.—As the result of a recent visit to the West by Mr. Roebling, the principal owner of the Stanley Electric Manufacturing Company of this city, and Dr. F. A. C. Perrine, president and general manager of the same concern, an arrangement has been entered into with the Northern Electric Company of Madison, Wis., by which the two companies will manufacture and sell each other's class of machinery.

COMPANY MATTERS.

Manchester, N. H.—The consolidation of the Merrimac Heat, Power & Electric Company of this city and Hooksett, and the Manchester Electric Light Company was effected last week. The capitalization, united, is $1,150,000 and the total water power is 20,000, together with big steam power. This unites all of the electrical interests of this city including that of the street railway.

POWER AND TRANSMISSION PLANTS.

Parksville, S. C.—The Twin City Power Company has applied for a charter. The capital stock is to be $100,000, and the company proposes to develop water power on the Savannah River in the counties of Edgefield and Abbeville, and to build electric light plants, etc. The incorporators are S. Soylor, and W. H. Chew of New York, D. M. Mackaye of New Rochelle, N. Y.

Peach Bottom, Pa.—The Susquehanna Electric Power Company, a Baltimore corporation, will begin work on its $4,000,000 plant here about September 1. A dam will be constructed and a power house erected on the banks of the Susquehanna River. The plant will generate 40,000 horse power, of which the United Street Railway Company of Baltimore, has contracted for 20,000 horse power for forty years. The company will also furnish electric light for Baltimore.

Raubsville, Pa.—Work on the plant of the Lehigh Power Company, whose plant is situated on the Delaware canal between Riegelsville and this place, has been commenced, and the contract calls for its completion by November next, when the machinery is expected to be in operation.

St. Paul, Minn.—The falls of the Apple River in Wisconin will be utilized next month into power for factories in this city. Five thousand horse power will be available at the start, and that supply may be doubled. The opening of the new plant will mitigate in no small degree the local smoke nuisance.

AUTOMOBILES.

Ilion, N. Y.—The Remington Automobile and Motor Company, recently incorporated, will have its plant located here, and expects by winter to employ from 200 to 300 hands. The company will manufacture gasoline, steam, electric and other motor vehicles and also gasoline engines and small launches. The capital stock is $250,000. Philo E. Remington is president, S. C. Burch treasurer, and P. A. Stubblebein secretary.

Scranton, Pa.—P. J. Collins of this city has invented a new style of electric automobile and a company is being formed to manufacture it here.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16⅝@16¾c.; Lake, 16½@16⅝c.; casting, 16¼@16⅜c.

Business failures in the United Stated last week numbered 177, against 136 the same week last year.

It is again reported that President McCall, of the Philadelphia Electric Company, is to resign August 15 (to-day)

The National Telephone and Telegraph Company, capital $50,000,000, will probably not be organized before September 1.

The Chicago City Railway Company has declared the regular quarterly dividend of 3 per cent., payable September 29.

A dispatch from Springfield, O., states that the Dayton, New Carlisle & St. Paris Traction Company has filed a mortgage for $1,350,000.

The striking street car employes of St. Louis have incorporated the Labor Union Street Railway Company with a capital of $5,000.

The New York, Westchester & Connecticut Traction Company has filed a mortgage to secure $2,500,000 4 per cent. 50-year gold bonds.

Stockholders of the New York Telephone Company have voted unanimously to increase the capital stock from $16,000,000 to $30,000,000.

The Chesnut Hill Railroad Company of Philadelphia, Pa, has declared a dividend of 1½ per cent., payable September 4 as registered August 20.

The Schuylkill Traction Company of Philadelphia will increase its capital stock to $2,000,000 and build a road from Pottsville to Shenandoah, Pa.

Directors of the Metropolitan West Side Elevated (Chicago) have declared a dividend of 2 per cent., on the preferred stock, payable August 31.

The York (Pa) Traction Company has given a mortgage to secure an issue of bonds for $1,500,000 to the Real Estate Trust Company, of Philadelphia.

The Philadelphia, Germantown & Norristown Railroad Company has declared a dividend of 3 per cent., payable September 4 as registered August 8.

The report that was current recently to the effect that an alliance had been formed between the Long Island Railroad and the Brooklyn Rapid Transit Companies has been denied.

The Harrisburg (Pa.) Electric Light, Heat and Power Company has declared a dividend of one per cent. This is the second dividend and there will be another in December.

The Philadelphia "Stockholder" says that rumor has it that President Rossiter, of the Brooklyn Rapid Transit Company, will resign, to be succeeded by a representative of the Yerkes crowd.

Almost the entire plant of the Pittsburg Reduction Company's aluminum works at New Kensington was destroyed by a tornado. The loss is estimated at $100,000 and the works will be closed down indefinitely.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 14@17; New York Electric Vehicle Transportation, 7½@8½; New England Transportation, 4@4½; Gramophone, 35@40.

The Remington Automobile and Motor Company has been incorporated at Trenton, N. J., with a capital of $250,000. The plant will be at Ilion, N.Y., and it is expected that by the winter 200 to 300 hands will be employed.

The receipts of the United Traction Company of Albany, N. Y., for the week ending August 2 were $28,003 60 making a gain over the corresponding week of last year of $2,469 79. The Albany division's gain was $2,066 14 and the Troy division $403 65.

The Merrimac Heat, Power and Electric Company and the Manchester Electric Light Company of Manchester, N. H, have been consolidated with a capital of $1,450,000. This consolidation unites all the electrical and street railway interests in that city.

Wall Street is full of rumors about changes to be made in the management of Brooklyn Rapid Transit when the executive committee meets this week. All the stories agree that another president will be named, "An expert from Chicago" is said to have gone over the books and made and offer to run the road for 2 per cent. of what he could save.

The works of the New England Electrolytic Copper Company at Central Falls, R. I., have shut down for what is given out to be an indefinite period, but what is believed to be for all time. The corporation owns reduction works in Montana and at Perth Amboy, N. J., and has several times threatened to move its works from Central Falls on account of excessive taxation.

Refering to the new issue of stock of the Metropolitan Street Railway Company President Vreeland says: "Nothing more will be done in regard to the new issue of stock until late in the fall. Many of the most prominent directors are away in Europe and elsewhere, and, as we do not need money now, we will not, until their return, hold the meeting which will decide how the stock is to be disposed of."

A copper mining man, who is considered an authority and who has just returned from an extended trip in Europe, says that owing to the fact that metal interests on the other side did not believe in the advance in copper—and have in fact been fighting the advance—the European markets are almost bare of the metal, stocks having been used up to the extent of all available scrap. The demand abroad is large and is likely to continue so for months, so that, in his judgment, the price of the metal must advance and remain high until production has been increased very largely or consumption has been materially reduced. Neither of these changes, he says, after a careful study of the subject, is likely to be effected for at least twelve months.

A Chicago dispatch says that direct charges of "illegal and fraudulent contracts and false statements to Stock Exchanges" are made in a bill in chancery filed by Sutro Brothers of New York against the Chicago Union Traction Company and the Consolidated Traction Company and the answer to the bill filled by the Union Traction Company. The bills are the result of the recent merging of the Consolidated Traction line with the Union Traction Company, the main condition being the granting of down-town concessions to the outlying lines and the guaranteeing of $6,750,000 4½ per cent., bonds issued in exchange for Consolidated stock. Sutro Brothers denounce the contract as void and fraudulent on the ground that no fair compensation was given. Sutro Brothers are large holders of Consolidated stock.

The Union Traction Company of Philadelphia, Pa., has refunded the $200,000 7 per cent. bonds of the Empire line (12th and 16th streets), maturing this year, into 3½ per cents. Fixed charges of $14,000 are thereby cut down to $7,000. The bonded debts next to mature are the 13th and 14th streets $700,000 7 per cents., due October 1, 1903, and West Philadelphia $246,000 6s due April 1, 1906. In other ways the Union Traction Company has been gradually reducing its charges. Several of the old land mortgages have been paid off. The company has in some instances invested the money of its insurance fund, which amounts to about $600,000, in these mortgages at a reduced rate of interest, paying off the original holders. Another step towards more economical operations has been accomplished in the case of the Lehigh Avenue line, the entire capital, $600,000, having been bought in by the Union Traction Company, which now has a clear profit on this line over all operating expenses.

EDITORIAL NOTES.

A New Scheme for Insulating Electrical Conductors.

About two and a half years ago we referred in these columns to a proposed method of insulating an electric current, suggested by a resident of Chicago. The arrangement consisted in inclosing the electric conductor in a train of underground tubing of insulating material from which the air had been exhausted. The idea was that by withdrawing all the air from the neighborhood of the conductor there would necessarily be an absence of moisture and consequently no opportunity for the escape of current through radiation. This scheme, owing presumably to several serious objections which we called attention to at the time, never came into use in a practical way, but the general idea would seem to be resurrected in a patent grated to Nikola Tesla last week. This patent, which is No. 655,838, refers to a method of insulating an electrical conductor by surrounding it with some substance which acts as a perfect insulator when frozen. The principal claim reads as follows:

"The method of insulating electric conductors which consists in laying or supporting the conductors in a trough or conduit filling the trough with a material which acquires insulating properties when frozen or solidified, and then causing a cooling agent to circulate through one or more channels extending through the material in the trough so as to freeze or solidify the material."

Referring to this invention in an interview Mr. Tesla is reported as saying:

"Prof. Dewar, of the Royal Institute, gave me the suggestion, which set me thinking along this line. That was in 1893. Realizing the great practical value of such an invention, I thought much about the subject, until a few weeks ago, when the complete system by which the desired end might be attained suddenly flashed across my mind as I was pondering upon the problem in my laboratory. Then the simplicity of the plan amazed me.

"Let me describe this method of insulation to you in its most comprehensive form. All wires will, of course, be placed underground before my cold air insulation can be used.

"Imagine, now, a great trough extending, if you wish, across the continent. It must contain a quantity of water or some other substance which will freeze. From my experiments I judge that sawdust and water will prove most effective. For the purpose of transmitting the current long distances I shall use a thin metal tube capable of resisting three hundred pounds pressure to the square inch. This tube will be submerged in the substance which I intend to freeze.

"In the whole discovery the most interesting feature is the method I have devised for freezing the material in the trough. Five or six feet below the surface the ground itself is very cold. Here the trough would be buried. Through the tube there will then be forced a current of gas—probably hydrogen—reduced to a temperature of minus 200 degrees or thereabouts.

"This, under ordinary circumstances, will be sufficient to freeze the material surrounding the tube in the trough, and also to neutralize the heat which would be generated by the electricity."

Mr. Tesla refers to the advantages that might be derived from his system of insulation as follows:

"It has been known since the days of Faraday that an electrical current cannot break through an insulation of ice. My success lies in discovering how to practically apply this truth. To show of what gigantic worth it may be needs but a moment. Grant that the invention has, as I believe, given to the world an almost perfect insulator, immediately there follow results which will directly or indirectly affect every manufacturing industry which in any way uses electricity.

"This will follow from the fact that no electricity will be lost in transmission. The cost of the new insulation will in the end be cheaper than that now used, and so it follows that the electricity which is to be utilized in a thousand different ways can be produced at a less cost. To telephone and telegraph companies, therefore, you see that my invention will be indispensable.

"Water power converted into electricity can by the new method of insulation be carried thousands of miles. At present the loss of electricity due to unsatisfactory insulation makes this impossible. I have been considering the possibility of carrying the power of Niagara to this city, and find that it can be done with a loss of not more than one-half per cent. to one per cent.

"For the first time in history a power will be used for insulation instead of a property.

Digitized by Google

Deaths from contact with exposed wires will be prevented by the new method. The increase in the speed of exchange of telephone and telegraph messages will be pronounced after the adoption of my discovery.

"These are the important changes in the electrical world which will be wrought by this invention. There will be also innumerable indirect results."

This system of insulation as will readily be seen would entail the digging of trenches and laying of tubing, to say nothing of forcing a current of gas through the whole system, which, over a long distance, would entail an enormous initial expenditure of money. This would seem to be the principal objection to the system and one which would prohibit its adoption in carrying power to localities situated a hundred or more miles distant, where fuel could be obtained at reasonable prices. That such a system, if found practicable, would have its field of usefulness there is not the slightest doubt, but that field would be limited or not sufficiently extensive to warrant insulation manufacturers looking about for some other means of earning an honest living.

* * *

Electricity as a Hazard to Life and Property. The number of fires attributed to the use of electricity that has occurred in the United States during 1899, has furnished a theme eagerly seized by many of the daily papers wherewith to fill space and incidentally the hearts of unsophisticated readers with fear. It is portrayed in a sensational way that the "subtle electric fluid" is responsible for an immense number of deaths that would not have occurred had we been using the oil lamps and tallow candles of our forefathers.

One daily, the name of which we intentionally omit out of compassion, cackles as follows:

"When the lightning was harnessed the world contracted to pay Jove a frightful price for his thunderbolts. Human lives by thousands, property and money by millions, have been paid for the use of that mysterious power, electricity.

"What the stupendous cost has been may never be computed and may never be set down in exact figures. Recently, however, some insurance men have been trying to find out what is really being paid for the telephone, telegraph, electric light and trolley car. The data are so meagre that not even an approximation of the aggregate cost can be made. Enough has been learned, however, to cause the investigators to pause in horror, and to ejaculate, in all fervency:

"Great heavens! is it worth the price?"

Another well-known publication assumes in referring to this subject a somewhat resigned, though horrified tone, and says:

"One State in the Union officially electrocutes its criminals sentenced to death. That State and every other one, unofficially has victims to electricity every day, and from almost every walk of life. It is part of the premium paid by civilization for the harnessing of the greatest element in nature, and as an additional tax there is the tremendous loss of property by fires which result from the same cause.

"For ten years the "electric hazard" has been reckoned with in insurance companies: To-day they are asking, "Is electricity worth the price?"

"In 1899 the aggregate fire loss in the United States was $153,597,830. In 1900 it promises to be $160,000,000. Yet in 1885 the loss was only $102,000,000."

This paper adds that in 1898, 336 fires were directly traceable to electricity resulting in pecuniary loss of $4,999,000. In 1899 there were 750 fires and a property loss of $6,428,000.

"Again," says the publication already referred to, "Not all the fires of electric origin are traceable, for the reason that destruction is total and the evidences of the cause are destroyed. Some insurance men are insisting that half the fire losses of the cities result from the use of electricity; others that at least 25 per cent. are traceable to it."

Admitting that the fire losses in 1899 amounted to far more than in 1885 which is only natural owing to the increase in population during those fourteen years—for the reason given above it is hard to tell whether fires are of an electrical origin or not, and in view of this fact where a building wired for incandescent or arc lights is destroyed, it is very easy when no contrary evidence can be obtained, to say that the fire *must* have originated through a defect in the wires.

Referring to the loss of life by electricity, one of the sensational dailies says:

"But the question of the cost of electricity has another and very sensational aspect. It is the loss in human life that should make the whole world pause before gloating over the progress made in chaining that mysterious, fickle and dangerous power.

"It is this side of the matter, too, that brings the question home to the people, that warrants every man in asking whether the privilege of riding in a trolley car is worth such awful slaughter."

Though many lives are lost each year directly or indirectly through the use of electricity, we venture to say that there are not as many lives lost in that way as in some other ways. Look at the number of persons who are drowned each year, and yet no one for a moment asks "Is shipping worth the price?"

When it is remembered that electricity has now come into universal use and that it plays an important part in almost every line of industry, railway, lighting and manufacturing, the percentage of accidents and deaths to the total number of persons directly or indirectly earning a living through it, will, we think, on careful investigation, be found less than in many other enterprises.

* * *

A Third-Rail Railroad. In spite of much opposition and many objections, the third-rail electric system would seem slowly to be becoming more popular for heavy railroad work. As is generally known there are several such systems in operation in Connecticut and elsewhere, and now we hear of another line about to be operated on this principle. We refer to the Albany & Hudson Electric Railway & Power Company which will shortly be ready to transport passengers and freight by what is declared to be the most completely equipped electric railroad in the country. The line of the road extends from Rensselaer to Hudson, N. Y., a distance of thirty-eight miles, and the route lies through a thriving country, touching at Clinton Heights, East Greenbush, East Schodack, Nassau, North Chatham, Kinderhook, Niverville, Stuyvesant Falls, Stockport, Scottville and other villages and towns of minor importance.

The power for the operation of the cars is transmitted by a third rail, laid outside of the rails of the road, which is standard gauge, and which has been constructed in a manner to make the highest speed possible attainable. The third-rail, which according to a daily paper is the object of fear and wonder at the present time to the residents of the country through which the railroad passes, is not likely to cause trouble owing to the precautions that have been taken to reduce the number of accidents to a minimum. The company for its own protection and that of the life and property of dwellers along the line, has erected a closely woven wire fence on either side of the road its entire length.

It has posted conspicuously at every crossing notices of warning that the road is operated by an electric rail and that trespassing is dangerous. At every crossing, highway or private farm crossing cattle guards of the best approved pattern have been put down, and at all of these crossings the third rail has been broken, the ends being connected for the continuation of the current by a cable that runs through a conduit under the roadway.

On entering Albany over one of the viaducts across the Hudson and on entering Hudson the trolley system will be employed. The power for the road is furnished from a plant installed at Stuyvesant Falls, where 8,000 horse power is generated by a system of water wheels that will take the whole flow of the Kinderhook Creek.

The first practical test of the system took place last Saturday night when the machines at Stuyvesant Falls revolved for the first time, sending a current of electricity through the network of wires and cables. The plant will generate current at a pressure of 12,000 volts, which at Hudson, North Chatham and East Greenbush will be transformed down to 600 volts, which will be the working pressure along the line.

It is proposed to haul freight over the road by means of a large electric locomotive, similar to the one in use in the tunnel of the Baltimore & Ohio road at Baltimore. The running time between Albany and Hudson for the present will be about two hours.

The cost of the enterprise at present exceeds $2,500,000, and it is generally believed that the road is only the beginning of a scheme to connect Albany and New York by an electric system.

It has been the practice of the Patent Office, for many years past, to accept renewal petitions for lapsed allowed applications signed simply by the attorneys who filed the original applications and not, as required by law, by the "inventor, discoverer, or assignee." The matter was recently called to the attention of the Commissioner of Patents, and a circular was issued by the Department to parties interested, calling attention to the statute governing the case, by which the law requires the petition for renewal of allowed applications forfeited through failure to pay the final fee within six months from date of such allowance, to be signed by the inventor, discoverer, or assignee; and that such application must be filed in the Patent Office within two years after the allowance of the original application. In the event that the inventor be dead, then the petition must be signed by the administrator, or the executor; if insane, by the guardian, conservator or legal representative. It will not be accepted if signed by the attorney.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

THE annual meeting of the New York State Street Railway Association will be held at Buffalo, N. Y., on September 18 and 19.

THE telephone service between Paris, Frankfort, and Berlin was opened to the public on August 6. The charge for the use of the line for 3 minutes between Frankfort and Paris is 80 cents, and between Paris and Berlin $1.20.

A PHYSICAN in the Corner's office of this city recently held an autopsy on the body of a man killed by lightning. It has been supposed that electrocution and lightning left a body in the same condition, but by the autopsy this was proved not to be the case. In electrocution large clots of blood form on the surface of the lungs and the pericardium, and every portion of the nervous system is made pliable. The body of the victim of lightning was found to be hardened noticeably, and there were no clots of blood on the lungs and the pericardium.

HARRY L. GOEHRING, a prominent member of the Allegheny County Bar, of Pittsburg, Pa., and James Scott, connected with the Carnegie Company, were badly hurt last Saturday in an automobile wreck. While riding Mr. Goehring increased the pressure to take a rather steep hill, when the gasoline tank exploded, throwing the machine fifteen feet into the air. Mr. Goehring was thrown to the pavement, alighton his head, and was rendered unconscious. Mr. Scott could not extricate himself, and fell with the burning machine on top of him. He was badly bruised. Both men, it is claimed, will recover.

THE meeting of the sixth annual convention of the Ohio Electric Light Association was held at Toledo recently. The meeting was presided over by the president, D. L. Gaskill. There were sixty-five electric companies on the list at roll-call. W. P. Ingalls, of Defiance, and F. E. Valentine, of Urbana, were made members of the organization. The address of welcome was made by Mayor Jones, after which the members and the women participated in a ride on the lake in a yacht. A paper was read by A. J. Stahl, of LaPorte, Ind., on the subject, "Two Revenues Instead of One; Electricity a Bi-Product." Another paper was by E. L. King, of the Fort Wayne Electrical Works, whose subject was "Induction Integrating Watt Meters." His paper was of a technical character and was voted by all to have been excellent.

ALL sorts of interesting features are to be included in the coming automobile exhibition and race meet at Washington Park, Chicago. The meet is to continue from September 18 to September 22 inclusive, and night races will be made possible through the use of the electric light. On the opening day there will be a general parade of nearly five hundred vehicles, with standing and moving exhibitions. Prizes will be given to the manufacturer presenting the greatest number of practical designs and to the manufacturer having the greatest number of automobiles in line. A special prize will be given for the most practical design of wagon for general purposes. The second day will be the commencement of the tests for general practical utility. There will be a hill-climbing contest, also a contest on an incline and decline grade, in which practicability and controlability of the vehicle will be demonstrated. Another important feature of the exhibition will be a mail race. Four mail boxes will be placed at equidistant points around the race track, and ten miles will be run, making forty stops in all, to collect the mail. Each driver will be obliged to stop at each box, unlock it and take a card from it and lock it again. The vehicle making the best time in the forty stops in the shortest space will be awarded the first prize, and the driver will receive a bonus. In all, $10,000 is to be awarded in prizes, and is to be apportioned to the events at the time of the final adoption of the programme. Bands of music will be in constant attendance and suburb decorations will make a most brilliant scene.

IN the "Revue Générale des Sciences, M Louis Olivier gives some further particulars of Paulsen's "telegraphone," which is attracting attention at the Paris Exhibition. He describes several devices for increasing the volume of sound or "intensifying" the record, to use the language of the photographer. The steel band with the consequent poles, which forms the original record, is made to pass between the poles of an electro-magnet, which transfers the record to another band. This may be done several times over, and the record taken simultaneously from all the bands. In another arrangement the record is intensified by passing it very rapidly through the second magnetic field, which, as we know, has the effect of increasing the induced currents, and therefore also the intensity of the secondary record.

THE scientific world is deeply interested in the announcement published in last Sunday's "Herald" of the discovery by the French chemists, MM. Desgrez and Balthazard, of a process for renewing air indefinitely. As described the method employed by these chemists completely restores to vitiated air its vital and wholesome quality. Bioxide or peroxide of sodium is used by the Frenchmen, and they assert that in process of decomposition, presumably at normal temperatures, it gives off oxygen and at the same time absorbs the carbonic acid produced by human breath and the burning of gas. The discoverers assert that by the application of their process divers and others who have to spend time under water or in tunnels or mines can have pure air created and continually renewed inside of an aluminum helmet, which is coated on the inside with a preparation of the bioxide of sodium.

Convention of the Canadian Electrical Association.

The annual convention of the Canadian Electrical Association will be held in the city of Kingston, Ont., on August 29, 30 and 31. A cordial invitation has been extended by the civic authorities, and also the electrical companies, which invitation has been accepted with the approval of the members and friends of the Association in Ottawa, where the convention was to have been held, but owing to the recent fire was found to be inadvisable to meet at Ottawa this year. The programme has not yet been completed, but will include the following papers to be read:

"Utilizing the Available Central Station Capacity," Prof. R. B. Owens, McGill University, Montreal.

"Use of Dynamo and Storage Battery in Telegraph Offices," W. J. Camp, of the C. P. R Telegraph Office, Montreal.

"Power Factor as Affecting Operation and Investment, with Special Reference to Induction Motors and Inclosed Arc Lamps," F. H. Leonard, Jr., Montreal.

"Government Electrical Standards," O. Higman, Ottawa.

"Railway Subject—giving several curves showing the average power during a day, and maximum and minimum requirements for power called for on the Quebec System," Mr. Blair, Quebec Railway & Lighting Company, Quebec.

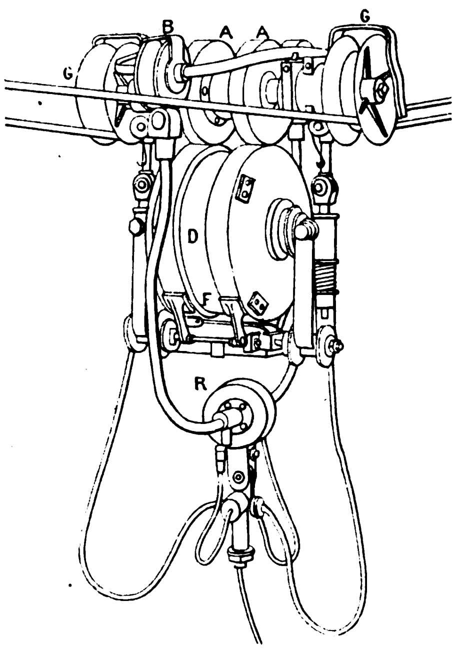
"Rotary Converters," A. Gordon Grier and J. C. Hyde, Montreal.

"Conditions Affecting the Wave Form of Alternators," Prof. L. A. Herdt, of McGill University, Montreal.

The City Council of Kingston has appropriated a sum of money for entertainment purposes, and has granted the use of the City Council Chamber for the sessions, also space in the City Hall for exhibits of electrical appliances, while the local electrical companies have agreed to furnish, free of charge, current and labor to exhibitors. Visitors will be given a trip through the Thousand Islands.

A LOMBARD-GERIN PATENT.

In the issue of ELECTRICITY of April 4, 1900, there appeared an article descriptive of what might be termed a trolley automobile—brought out in France by M. Louis Lombard-Gerin. This system, as will be recalled, consisted of an automobile operated by means of electric current taken from an overhead trolley wire by means of a flexible cable. The novelty of the system lay in the trolley contact, herewith shown, which consisted of a motor on



LOMBARD-GERIN AUTOMOBILE TROLLEY.

wheels, and for which a United States patent was granted the inventor on August 14. In claim 1 of the patent the invention is described as "an automobile-trolley comprising an apparatus provided with a shaft having a contact-roller adapted to travel on conductors insulated one from another, the said apparatus having a motor possessing a fixed inductor and a movable armature, the periphery of which directly actuates friction-rollers on the shaft of the said contact-rollers, in combination with a flexible cable which conveys the current to the motor of the vehicle."

MOTORS.*

BY CLAUDE W. HILL.

In designing motors for some classes of work it is necessary to take into account not only the average hp. which the motor is to develop, but also the maximum torque which it is to exert. Where no limit of current is specified, the average hp. only need be considered; but in cases where a machine is specified to give a maximum torque with a current not exceeding a given figure, then the specified torque and

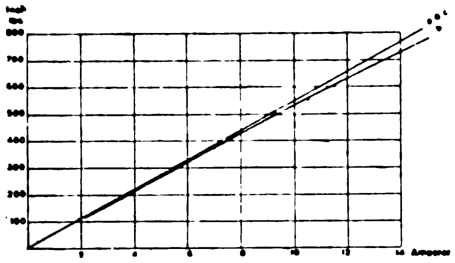

Fig. 1.

current must be taken as the basis of the design.

Taking the well-known formulæ, torque in inch-pounds,

$= \frac{63,025 \text{ hp.}}{s}$, and hp. $= \frac{E\,i}{746}$ (in which E = back EMF., and i = total current through motor armature), and combining them we get

$$\text{torque} = \frac{84.48\,E\,i}{s} \qquad (1)$$

or

$$s = \frac{84.48\,E\,i}{T} \qquad (2)$$

This formula shows that there is a certain speed for which a motor must be designed in order to fulfill fixed conditions as to voltage, current and torque, and it further shows that on a circuit of given voltage the smaller the current specified for the production of a given torque, the slower must be the speed (and therefore the larger the size) of the motor.

Formula No. 1 may be stated in another way. Taking

$E = \frac{N\,C\,S\,p}{10^8 \times 60 \times .5d}$, in which N = flux through one pole, C = total conductors around armature, p = number of pairs of poles, and d =

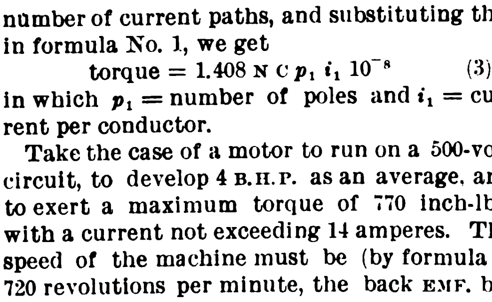

Fig. 2.

number of current paths, and substituting this in formula No. 1, we get

$$\text{torque} = 1.408\,N\,C\,p_1\,i_1\,10^{-8} \qquad (3)$$

in which p_1 = number of poles and i_1 = current per conductor.

Take the case of a motor to run on a 500-volt circuit, to develop 4 B.H.P. as an average, and to exert a maximum torque of 770 inch-lbs. with a current not exceeding 14 amperes. The speed of the machine must be (by formula 2) 720 revolutions per minute, the back EMF. being 467.5.

If instead of starting with formula No. 2 we start with formula No. 3, and calculate the value of N and C, we shall find that these values correspond to a speed of 720 revolutions with a back EMF. of 467.5.

There is no advantage in adopting a higher speed for the average hp., as the size of the machine is governed by the torque and current.

Thus if the machine were specified to give 4 B.H.P. at 1,400 revolutions with maximum torque and current as before, the carcass would still have to be of the size found by formulæ Nos. 2 and 3. It would have to be over-compounded, the shunt and series winding together giving 1,400 revolutions at 4 hp., and the series winding being sufficient to bring the speed down to 720 with the specified current. No gain would be effected in the size or price of the machine, the regulation would be bad, and the ratio of the reduction gearing would be increased with consequent loss of efficiency.

Where a steady speed is demanded and hand regulation is not possible, provided the supply pressure is maintained constant at the motor terminals, shunt winding will give the most satisfactory results, but where the leads are long and the fall of voltage appreciable, the magnet will be weakened, the specified current will be exceeded and there may be sparking. Compound winding should then be adopted, the series winding being proportioned to compensate the drop of volts on the shunt coil and so maintain a constant strength of magnet. The regulation will not be so good as with the shunt motor working on constant pressure, but the result obtained will be better than with the shunt machine working with varying pressure.

These points are illustrated in the accompanying curves of the machine mentioned above.

Fig. 1 is the curve of torque and current: *a* being for the shunt machine on constant pressure; *b* for the shunt machine with a fall of 15 per cent. in the voltage at maximum current; *c* for compound machine with the same fall. It will be noticed that *a* and *c* coincide.

Fig. 2 gives the curve of torque and speed under the same conditions.

*From the "Electrical Review," London.

Cancellation of Bonds for the Free Zone.

The Treasury Department at Washington has issued a statement with reference to the cancellation of bonds covering goods shipped in transit to Mexico, to the effect that the privilege accorded prior to the Act of March 1, 1895, covering merchandise destined for the so-called Free Zone, having been restored by the act approved May 21, 1900, bonds covering merchandise destined for any place in the Republic of Mexico may now be cancelled by certificate of inspection and exportation issued by the Collector at the frontier port and a landing certificate given under the hand and seal of the Collector or other chief revenue officer at the foreign port.

MODERN ELECTRICALLY OPERATED MACHINE LATHES.

BY FRANK C. PERKINS.

The most up-to-date machine shops in this country are rapidly installing electrically driven machinery and are finding out from experience that they are not only successful in every way, but are more economical, simple and easier operated than those of older designs. The Brooks Locomotive Works of Dunkirk, N. Y., has recently installed a large wheel lathe which is electrically driven, as shown in illustration, Fig. 1. This machine is a double wheel electrical lathe and swings 79" in diameter.

The face plates can be driven together or separately, or at the same or different speeds, as

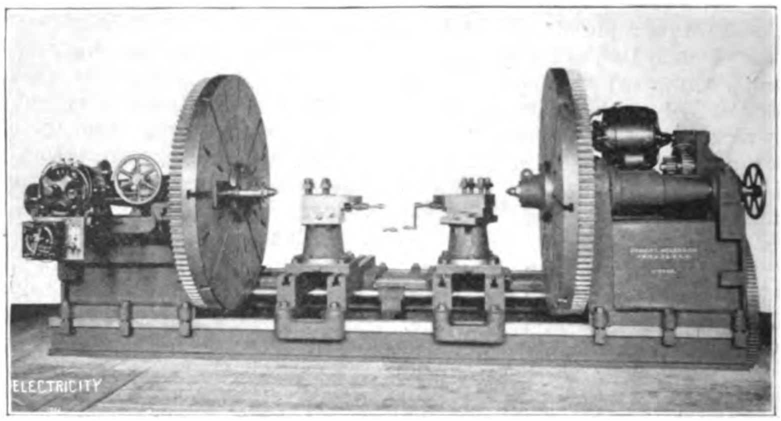

Fig. 1.—Electric Wheel Lathe at Brooks Locomotive Works, Dunkirk, N. Y.

desired. Feeds variable and self-acting at all angles by overhead rock shaft, actuated by slotted cranks at end of spindles. Each main spindle has an internal sliding spindle, with sufficient movement beyond face plates to swing driving wheels on axles when crank pins are in place. The center line of spindles is carried backward so as to bring the cutting strains on greatest diameters within the area of bed, by which means the front slides are elevated to correspond with curvature of face plates, increasing the strength of bed where subject to the greatest strains, also shortening, and consequently stilling the tool rests.

This electric lathe was installed by Bement, Miles & Co., of Philadelphia, Pa.

Fig. 2 shows a 52" electric engine lathe which was recently installed in the plant of the Chicago Ship Building Company. The illustration will show plainly the manner of connection, which is done by means of a short belt and has proven entirely satisfactory. The electric motor, shown in Fig. 3, is a C. & C. double commutator motor with field control, five horse power, 220 volt, with range of speed from 250 to 650 revolutions per minute. This electric lathe was installed by The American Tool Works of Cincinnati, O. The headstock is especially rigid and is secured to the foundation by bolts, which are tapped directly into the bed, making it very solid and absolutely precluding all tendency to vibration. The spindle is made of a special hammered steel, accurately ground. The bearings are made of the best phosphor bronze, and have special fa-

cilities for lubrication. The carriage is 60" long, and has more metal over the inside V than is usually found in engine lathes. It has a full bearing on both outside Vs, and is further secured against vibration by having a bearing on the front inside V, and to all three of these bearings it is accurately fitted by scraping. The compound rest is provided with power cross and angular feeds. The base is graduated so that taper turning or boring can

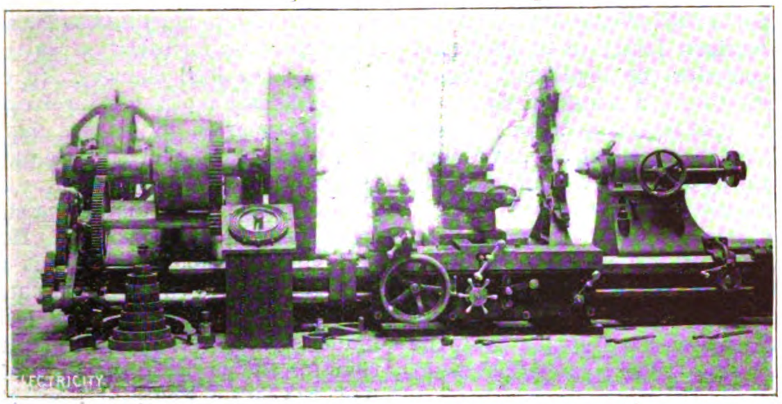

Fig. 2.—Electric Lathe at the Chicago Ship Building Company's Works.

be done with accuracy. The top slide has an extra long movement, and is provided with four clamping bolts, which hold the tool rigid. The automatic stop is adjustable on the bed, and can be set to stop the carriage at any given point. The tailstock has a long continuous bearing on the Vs, is easily and rapidly moved along the bed by means of the crank and gears, as shown. It is provided with a setover adjustment independent of the base. The base is clamped to the bed by four large bolts, and is further secured against movement by a

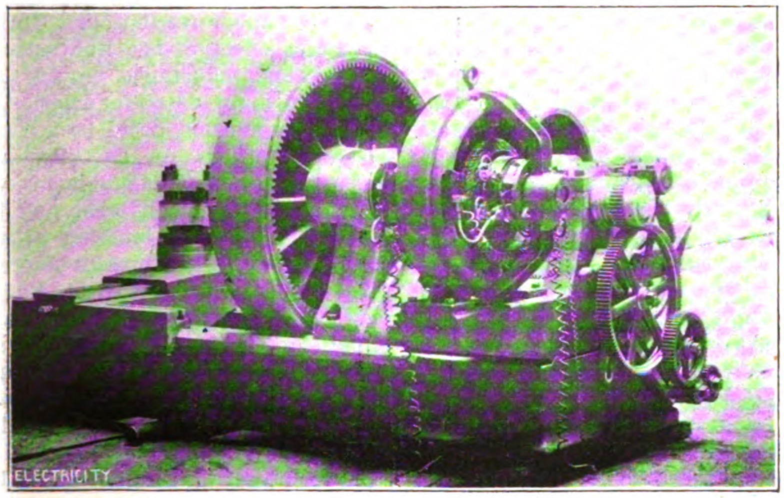

Fig. 3.—Head End of Electric Lathe at Chicago Ship Building Company's Works.

pawl engaging a rack in the center of the bed and cast integral with it. The spindle is operated from the front side of the tailstock through the hand-wheel and gears, as shown. All gears, including bevel and spur pinions are cut from the solid and the rack pinions, are made of steel and accurately cut, while all parts subjected to wear are case hardened.

Opposed to Wireless Telegraphy.

It seems that the steamers crossing the English channel between Dover and Calais will not be equipped with wireless telegraphy apparatus, as was announced some time ago. This is owing to the fact that the British Post Office authorities object to the scheme.

REGULATION IN LONG-DISTANCE TRANSMISSION.*

BY FREDERIC A. C. PERRINE, D. SC.

When we speak of the regulation in an electric plant of any kind, it is common to refer only to the maintenance of the proper voltage at the lamps or the motors of the customers, but in order that a proper system of distribution in the regulation for the customer be obtained, it is necessary in the design of the plant to consider regulation at many different points and of several different kinds in order that the service offered may be perfectly satisfactory. In the first place, the periodicity of an alternating-current supply must be maintained constant, which means that the water wheels must be adapted with regulators which will produce a constant speed of running, irrespective of changes in the load and changes in the voltage. Passing the water wheels and approaching the generators we find that here the regulation is one of voltage, and that in the generating station the voltage must vary with varying load, even though the customer may require a voltage as constant as the periodicity. The step-up transformers in the generating station are involved as one of the factors which determine the amount of voltage variation which the generator must provide, and passing these transformers we find in the line a disturbing element that must be carefully considered, even though at its end a voltage as nearly constant as may be must be attained. The final adjustment of the voltage to suit the customer's needs is provided in the sub-station where the step-down transformers are located.

It is the writer's purpose to call attention to the difficulties of regulation at each one of these points and to point to general solutions in overcoming such difficulties as may be presented without trying to offer the definite solution of any particular case. This discussion, therefore, may serve merely to make the ideas already familiar to us all more concrete, and to call attention to a few neglected conditions in obtaining a perfectly satisfactory service.

As has already been said, the regulation of the water wheels must be such as will maintain constant speed, and such constancy is obtained in a different manner with high and low head wheels. With wheels operating under a low head of water, large penstocks in which the water moves at a low velocity are generally available, and, in consequence, regulation of such wheels is always provided by variation of gate opening. This system of regulation, while certainly difficult to accomplish on account of the weight of the moving parts, is ideal in respect to conservation of water, the water allowed to flow being in some respect proportionate to the load. We say "in some respect," on account of the fact that the efficiency of all water wheels falls very materially as the load decreases. This difficulty of efficiency variation produces a difficulty in regulation, for the reason that a certain load change at full load requires a smaller gate variation than the same load change at one-quarter load, and in order to surmount this difficulty a recent Italian designer has attempted to close bucket openings in place of the gate openings in his wheel, thus operating certain buckets always with full volume of water maintaining full bucket efficiency at all loads. Such wheels have not been built in this country, although a set has been contracted for by the Montmorency Electric Power Company at Quebec, where the wheels under this design are now being installed.

The good regulating points of the low head wheels are sacrificed whenever the velocity of flow or the length of a column in the penstocks is increased, and their regulation is correspondingly improved by shortening the penstocks, even to its entire obliteration, and operating the wheels in the forebay itself.

However obvious this may seem, it is nevertheless the fact that in an eastern plant recently installed and not yet in operation, the engineers have led the water from the forebay through 160 feet of entirely unnecessary penstocks laid level.

Low head wheels are of far less importance to the members of the Pacific Coast Electric Transmission Association than are those operating under high heads. The characteristic of a high head plant differing from that of a low head plant is that the penstock instead of being short, of large diameter and of low water velocity, is long, of comparatively small diameter, with the water velocity rising as high as 12 to 15 feet per second. From this condition results that any attempt to regulate the wheels by varying the flow of water produces fluctuations in the pipe which are not only difficult to resist mechanically in pipe construction, but also are most disastrous to attempts at regulation, since the curve of efficiency of the high head water wheel varies much more rapidly from full load to one-quarter load than the curve of efficiency of the low head wheel; and furthermore, any attempt at closing the water gate at the end of a long pipe in which

*Paper read at the Fourth Annual Transmission Convention, held at Mount Tamalpais, Cal., June 19-20, 1900.

Digitized by Google

the water is flowing at a high velocity is resisted by the water within the pipe with a tendency to momentarily maintain the same energy without much reference to the size of the opening. The effect of varying the opening in the water gate is to vary the velocity of the water flowing through it, and, as the energy is equal to one-half the mass times the velocity squared, the variation of velocity tends to maintain a constant amount of energy imparted to the wheel in spite of the variations in the mass. In a station operating more than one wheel from the same pipe line, this effect is distributed amongst all the wheels running, and it is often possible by closing one gate partially to speed up all wheels for an instant, the wheels only attaining the proper speed due to the reduced opening after they have been subjected to a series of impulses from the surging water within the main pipe. In one case, to which the attention of the writer was called, where wheels were operated under about 250 feet of head, closing of a single gate at the power house would cause the water to rise in the forebay as much as ten feet, which rise was necessarily occasioned by variations in pressure equal to about ten per cent. of the full pressure at the power house. Furthermore, it is hardly to be conceived that any throttling nozzle that has been devised can prevent leakage and prevent eddies of water on the back of the bucket producing disturbances of the speed regulation. In consequence of these facts, it seems to be the conclusion that regulation of high head wheels can be best obtained by a system which does not disturb the flow of water in the pipe line, which points either to the deflecting nozzle or the deflecting hood, and while we have no tests of the two systems which are thoroughly reliable, it certainly seems that the undistorted stream from a deflecting nozzle should give higher wheel efficiency at partial loads than will the distorted stream produced by a deflecting hood. If either of these systems is to be used the plant should be so installed as to reduce the wastage of water at partial loads as far as possible, since, of course, with a deflecting nozzle or a hood, the flow of water through the nozzle is always constant. Such a sub-division, therefore, of the water wheel units is necessary as will allow cutting out of entire wheels when the load shall vary materially. It is not the desire of any engineer to install small generating units which this system of regulation seems to entail, but the same result can be obtained by a multiplication of the number of wheels attached to each generating unit. Up to the present time no more than two wheels per generator have been installed in any high head plant, though in certain low head plants as many as five or six wheels have been attached to one generator. Should high head plants be installed with as many wheels as this the cost of the entire plant could be kept down by increasing the speed of the generators very materially. In fact, for units as large as 1,000 kilowatts a speed of from 600 to 1,000 revolutions should be readily attained and the cost of such a plant with five or six wheels on the generator shaft would not be greater than the cost of a plant with one wheel running at about 200 revolutions attached to a generator of the same capacity.

When we pass from the water wheel to the generator, we find that while the water wheel must regulate for constant speed, the generator, which is operated at the constant speed of the water wheel, must be adapted for variable voltage regulation. In specifying generators it is far more common to demand extreme self-regulation as regards constant voltage than it is to demand a possibility of great voltage variation, whereas in the generating station the machine must necessarily be varied in voltage even though a constant voltage be demanded by the customer, and, in consequence, machines that are designed for self-regulation of constant voltage are not generally satisfactory in long-distance transmission plants. This is especially true on account of the fact that it is the custom authorized by the standardizing rules of the American Institute of Electrical Engineers to measure the regulating properties of the generator on a non-inductive load. A non-inductive load in a long distance transmission plant is an impossibility, for even though the plant be used only when furnishing a non-inductive load, as of incandescent lights, the lines and transformers introduce at the generator a reactance which must be taken care of by the design of the machine. Indeed, the extremes of reactance are always encountered in such plants, since at low loads the long lines will make the generator current lead; at high load, they may lag very materially. In consequence of these facts, the inductive regulation of the generator as such must be as high as possible, though the ohmic resistance of the machine need not be necessarily low as would be the case for a close self-regulating machine operated on a non-inductive load; and many generators acceptable in power stations for the reason that under the conditions of non-inductive operation very close self-regulating properties, are unsatisfactory in long-distance plants: both for the reason that they will vary in voltage greatly when inductive loads are applied, and furthermore, they have not sufficient margin of field capacity to permit of over-excitation necessary for overcoming the effect of the lag factor. In consequence, the capacity of both the field and the armature must be higher than is commonly allowed, or else under the common circumstances of running, the machines will not be able to use within 10 or 15 per cent. of the full energy delivered by the water wheels. It is not often acceptable in long-distance transmission plants that the generators should have a possible voltage regulation equal to the full amount of the line loss, but they must be designed to permit from two to three times the voltage variation determined by the losses in the lines. It may seem anomalous to state in the beginning that the machines need not be designed for close self-regulation and in the end that their inductive drop must be smaller, but when it is remembered that close self-regulation may be produced by low ohmic resistance, which is unnecessary for small inductive drop, the anomaly is explained. A complete discussion of this effect was given by Prof. Cory last year before the Association.

The same observations are true of the step-up transformers; this, also, having been called to the attention of the Association last year by the writer in discussion of the experiments in Stockton. The only essential difference between the transformer effect and the generator effect being, that while the regulation of the generator on non-inductive load can be about one-third the regulation of the transformers on an inductive load, it seems to be impossible to design a generator better than about one-fifth as good regulation as the best transformers, though the writer's observations last year on transformers show that while a transformer designed for two per cent. non-inductive regulation may give a ten per cent. rise in voltage on a leading current, it has been found that transformers with the same non-inductive regulation can be designed to give a voltage rise, under the same conditions, not over one-quarter as great: and, furthermore, as the machine must compensate for the voltage regulation, both within its own coils and also within the coils of the step-up and step-down transformers, as well as throughout the whole line, it follows that the transformers should be designed to relieve machines as far as possible of great necessity for variation as the inductive effect of the load changes. In consequence, the specification of the inductive drop through a transformer is, in general, more important than a specification of the non-inductive regulation.

Perhaps the worst disturbing effect of all is to be found in the line itself. Here we have not only an inductive drop, but also a heavy capacity current, the capacity current remaining practically constant at all loads while the inductive drop varies with the load. The question for the proper disposition of the line to have the capacity current from the line counteract entirely the various reactances throughout the circuit, is a very alluring one and has been tried by many designers; but as the capacity current remains constant while the reactance continually varies with the load, it is impossible to so adjust the line in height above the ground a distance between wires as to effect any serviceable self-regulation. If self-regulation consisted in the maintenance of a constant voltage at a constant load, the line might be so designed as to aid in producing this effect, but as the load falls the importance of the leading current in the line becomes greater, while as the load rises its importance diminishes, in both cases disturbing the voltage and demanding from the machine a wide range of possible manual regulation. Until recently, the exact effect of the line as regards both capacity and inductance, proved to be a difficult problem presented for solution, though, of course, the solution could be accomplished by several methods on devoting a sufficient amount of time. This problem is one that has given the writer much labor, and it was with pleasure that in conjunction with Mr. F. G. Baum, he was able to present before the American Institute of Electrical Engineers this year a simpler solution for the regulation of a circuit for any character or changes of load, taking into account not only the questions of the load and transformers, but also the line. The line itself limits the amount of power that can be transmitted to a great distance, for the reason that for a line of about 100 miles in length, with voltage between 40,000 and 50,000, from 1,200 to 1,500 kilo-volt amperes must be used in charging the line—unless reactance coils are used—and, in consequence, an amount of power less than about 3,000 horse power cannot be satisfactorily delivered such a distance even where the selling price of power should be enough to counterbalance the cost of the line of such a length, the large capacity current making a question of any feasible system of regulation almost an impossibility with a smaller amount of power to be delivered.

By the use of reactance coils at the sub-station the generator current at no load can be made very small, and I believe it will pay to put in reactance coils on long lines not only to reduce the generator current and line loss at no load, but as sub-station voltage regulators.

Digitized by Google

If half the charging current be neutralized, the lower limit given for the power that may be transmitted over a 100-mile line will be reduced one-half.

I believe the proper way to regulate the voltage at the sub-station is by the use of adjustable reactance coils and a compensated voltmeter at the generating station. In any case, feeder regulators should be put on the feeder circuits, but no regulators on transformers, especially where two or more banks are operated in parallel.

Finally we come to the regulation within the sub-station. A sub-station must deliver voltages that are constant within short periods at the very least. The customer may demand a voltage variation on account of the losses within the distribution lines as his load changes, but during such periods as the customer's load remains constant, the voltages must remain constant. The fact that his voltage may change with his load demands some system of manual regulation within the sub-station, and while a possibility of varying the voltage at the sub-station on the customer's lines as much as fifteen per cent. is in almost the extreme case ample allowance, the fact that the generator will necessarily alter its voltage with an alteration in the character of the load, irrespective of its size, it is not generally safe to install a sub-station system in which at least twenty-five per cent. voltage variation is not in the extreme cases possible.

In this paper nothing very startling has been presented, but it is the writer's opinion that the following points are somewhat new and demand careful consideration:

First—The subdivision of water wheels and the use of extremely high-speed machinery.

Second—A wide range in the possible voltage variation in the generators, with generators and transformers both designed not for good non-inductive load regulation, but for good inductive load regulation.

Third—Lines designed for the smallest possible capacity current without reference to any attempt at balancing the line capacity against the load lag.

Fourth—The use of reactance coils at the sub-station—instead of regulator heads on transformers—and wide range of regulators in feeder circuits.

Work Done on the New York Rapid Transit Subway Up-to-Date.

(From the N. Y. Herald.)

While it is now three months since the first actual excavation for the rapid transit subway was made, and the majority of New Yorkers have seen no evidence of work on what will be the greatest underground railroad in the world, progress satisfactory to those who have its construction in charge has been made.

Some of the contractors have been held back and the work delayed by a tardy delivery of steel, but William Barclay Parsons, chief engineer of the Rapid Transit Commission, has been advised that shipments will be begun before the end of the month. By that time excavations at several points will have been so far advanced that steel can be put in as soon as it is received, and then progress rapid enough to reassure the most sceptical can be made.

There are at present more than three hundred men working daily on the subway. These are employed on five of the fifteen sections into which the work has been divided. These five sections include about half of the distance of the tunnel line, but the excavation so far accomplished is inconsiderable when compared to the work to be done

To be convinced that work on the road is really under way it is only necessary for one to take a trip to Washington Heights and see what has been accomplished on the thirteenth and fourteenth sections, which include the stretch between 133d street and Hillside ave. McCabe Brothers, of Baltimore, have the contract for these sections, and, with the exception of a distance of a few blocks, it means boring a tunnel through solid rock, at some places one hundred feet below the surface.

The little hole in the ground that Corporation Counsel Whalen made on May 14 at 156th street and Broadway with a silver pick is now a trench twenty feet wide, fifteen feet deep, and extending up to 158th street. At this point it will be necessary to go down only seven feet more, as a station will be built there, and the roof of the subway will be only a few feet below the surface. From 158th street north for two miles to Fort George, however, and from 156th street south to 135th street the subway must be carried through solid rock.

Boring on the tunnel at 158th street will be begun in a few days. This will be done by means of compressed air drills, three or four of which will be operated side by side on a single facing.

Compressed air to operate these drills will be manufactured in a plant which the McCabes will build on a plot of land just north of 162d street, on the west side of the Boulevard Lafayette.

At 168th and 181st streets station shafts are being sunk. The one at 181st street is fifteen by thirty feet and will go down a distance of one hundred and twenty feet. It already has been sunk forty feet. The one at 168th street, which is fifteen by twenty feet, has already been carried down fifty feet, or half its depth.

These shafts are sunk through solid rock from top to bottom, and as soon as they are completed boring on the tunnel to the north and south of them will be begun.

From 133d street to 135th street, where the road will strike underground again after ten blocks of elevated structure across Manhattan valley, there is another excavation in Broadway. This is for the foundation of the two blocks of viaduct in the McCabes' contract, work on which will be begun this week.

But slow progress has been made on the eleventh section, in Broadway from 104th to 125th street. John Shields has the contract for this section, and work on it was begun at 120th street on June 18th. Delay on this section is due to a water main in the middle of the parkway, which will have to be moved out of the way of the tunnel.

The excavation at this point has been carried from 120th street to 122d street the width of the subway, and to a depth varying from one to five feet.

From 122d street to 125th street there is a trench in the middle of the thorougfare about three feet wide, which has been dug down to the water main. As soon as the big pipe has been moved to the west side of the parkway, where a trench is being dug to receive it, a large force of men will be employed and the work will be rushed.

Work on the down town sections has been begun only in Elm street, near Reade street, and in the upper end near Great Jones street. At both of these points there is a noticeable excavation, but nothing like tunnel depth has been reached.

Work on the third section, between Great Jones street and Thirty-third street, will be begun within a few weeks. Holbrook, Cabot and Daly, who have the contract for this section, established fixtures at Seventeenth street and Union Square nearly a month ago, when it was understood the deliveries of iron would begin by August 1.

Owing, however, to the fact that the contractors will not be permitted to keep the roadway in this busy section of Fourth avenue open more than by short sections for a few days at a time, no work has yet been done. As soon as the iron is received the force of men, which was ready for work on August 1, will begin excavations.

The sub-contract for the fifth section, which includes the line from Fourth avenue, through Fory-second street to Broadway, has not yet been awarded. Shopkeepers and residents in the street are very anxious that work at this point be begun without delay, so that the subway may be put in before the street railway company finishes its work and repaves the street.

The work of clearing underground obstructions out of the path of the subway, which has been going on steadily for more than four months, being of a primary character, has enlisted the greater part of the efforts of the construction company thus far.

Good progress, however, has been made in this direction. James Pilkington, who has obtained the contracts for much of this work, has already completed the job on the Bleecker street sewer. Work here was begun on March 26, when Mr. Parsons lifted out the first paving block, and finished on June 21. Sewer constructions have also been completed on Mulberry and Tenth streets.

Work is now being done on the Canal street sewer, the one in Pearl street, the sewer crossing Fourth avenue at Seventh street, the sewer in Twenty-second street, the one in 110th street between Fifth and Lenox avenues, the sewer in 124th street at Lenox avenue and the one in 157th street at Broadway.

Electric Trains for the Manhattan Elevated Railway.

The first electrically equipped train will be run on the Manhattan Elevated Railway of New York as early as September 15, according to a statement by W. E. Baker, superintendent of electrical construction. The engines and generators are now being pushed to completion, and the first engines will have their trial trip on the Second Avenue line in less than four weeks. The change from steam to electricity will cost the company $12,000,000. The total capacity of the new power house will be 64,000 horse-power; the maximum horse-power, exclusive of the storage battery plants, which will be installed at the sub-stations, will be 100,000. The equipment of the trains will consist of two motor-cars, one at each end of a six-car train. The motor-cars will carry four motors of about 100 horse-power, giving the train a total of 800 horse-power. The sub-stations on the east side have already been located at Allen and Division streets, 34th street and 98th street. The first section to be equipped completely will be the Second Avenue line, the reason for this choice being on account of its nearness to the station.

TO HARNESS THE SUSQUEHANNA.

(From the New York Financier.)

In financial magnitude the prospective plans of the Susquehanna Electric Power Company excel everything heretofore attempted in Baltimore. The company was formed under Maryland laws in 1896, and since that time its experts have been measuring, calculating and estimating in order to make certain that the project then outlined could be realized in fact as well as in theory; it is understood that, after carefully going over the ground and making sure that there is no miscalculation or mistake to frustrate the project, the company has secured the active support of several of the big banking institutions, as well as of a number of prominent Baltimoreans, whose influence and ability are fully equal to the task they have undertaken. This is nothing less than to harness the waters of the Susquehanna River, very much as Niagara is controlled, and by means of dams, head and tail races, immense turbines and whatnot, generate about 40,000 horse-power and transmit it as electricity to Baltimore, whence it will be distributed for operating the street railways, electric lighting plants and manufacturing concerns. The company's work will begin on the Susquehanna near Peach Bottom, Pa., where it has been assured the full 40,000 horse-power can be obtained; the transmitting line will cross York County as nearly as possible in an air line and will be continued through Maryland to the eastern limits of Baltimore, where it will connect with the wires of the United Railway Company. It is said that the railway company already has a forty-year contract for one-half of the power named, and that its use will result in a great saving to that concern in its expenditures for power and allow it to supply electricity for lighting and for power in the smaller manufactories at considerably reduced rates. The payments made by the railway company will cover the power company's operating expenses and provide besides a fund sufficient to discharge the interest on the first issue of bonds. These will amount to $4,000,000, but the company will be capitalized at $12,000,000 and have $8,000,000 in reserve for future developments. The financial details are to be managed by the Continental Trust Company, whose president, S. Davies Warfield, has become deeply interested in the success of the undertaking. The mechanical part of the work is to be done under the supervision of engineers who have the advantage of experience gained in installing the hydraulic and electric plants that are operated by the Niagara. The success of the great enterprise is not doubted by any one competent to give an opinion upon the subject, and the possibilities which must follow the initial introduction of current from this source are sufficient to make enthusiasts of all who are in any manner concerned. The complete development of the plans now outlined will give Baltimore advantages that can hardly be estimated at present.

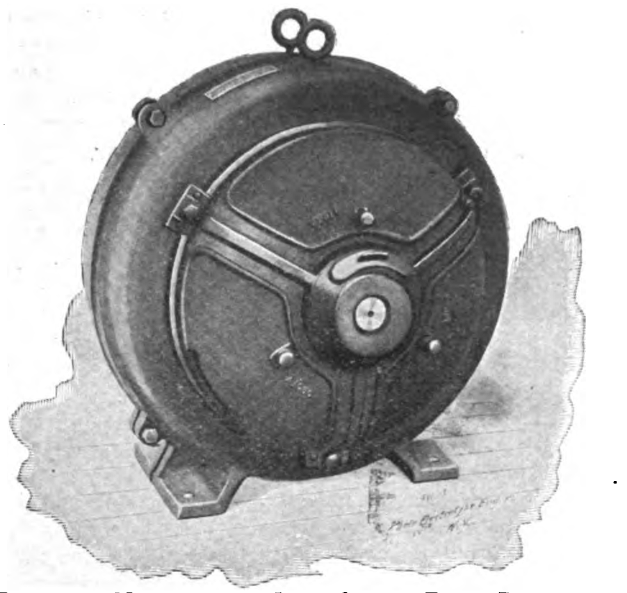
ELECTRIC MOTORS IN THE ART OF PRINTING.

People thought it wonderful when Gutenberg, by hard work, was able to take 300 impressions a day with his printing press. That was about the middle of the fifteenth century. To-day the printing press is a marvel in mechanism, and not only prints the papers, but pastes, folds and counts them at a remarkable rate of speed. The development of the printing press is due largely to the fact that there is no class of business men who are quicker to see the value of an improvement in trade methods than printers and those in the allied trades. The most recent advance is the application of the electric motor to the presses and other machines, and we herewith present some facts and figures to show the advantages of using electric motors and to prove the superiority of electric apparatus.

There is a great saving in the cost of power. The power is used only in proportion to the work done. It is not necessary to supply power for the whole plant when only one press or machine is working. The moment the operator breaks the current and the motor stops, all expense for power immediately ceases. This is an extremely important point with job printers, for a large percentage of time is taken up in the "make ready." By passing the current through a meter, an exact register of the amount of energy consumed may be recorded. This is impossible in case of belts, shafts and pulleys, for the tightness of the belt, the arc of contact and the smoothness of the face of the pulleys are variable quantities and may be one thing this week and another next. The line shaft, no matter how carefully it may have been erected, will soon get out of alignment, caused by the displacement of hangers, or settling of floor and walls. This means another loss of power and useless expense. Mr. George Hill, consulting engineer for the American Book Company, conducted a series of tests at the factory of the Western Electric Company to determine which motor should be recommended for purchase. In this contest, the motors of ten of the best-known manufacturers in the country competed and the Lundell motor won the prize. Efficiency, ability to stand over-load, and price, were the points considered.

Since adopting the Lundell motors in their plant, they have made a saving of 44.2 per cent. in the cost of light and power,

One feature of this application of power is that each press or machine is independent of all others, so that if carelessness or accident should cause one machine to stop, no other will be affected. The other work can go right on.



SIX-POLE ENCLOSED MOTORS WITH SELF-OILING RING, BEARINGS AND REMOVABLE COVERS FOR DIRECT CONNECTION, GEAR OR BELT DRIVING

There are many other objections to the use of belts. Loose belts entail jerky motions; tight belts cause hot bearings: lacings tear out; hangers become unsteady, and oil drips on paper and clothing; pulleys become unbalanced and rattle and the shafting wobbles. The Lundell motor is steady and absolutely reliable, as exemplified in over a thousand presses operated by Lundell motors.

Where belts, shafts and pulleys are used there is a deterioration of stock because of the flying dust and grease, but with the use of the Lundell motor there is nothing of the sort. The floor, walls and ceiling can be kept entirely clean, and there is no loss of light because of the mass of belts, hangers, shafts and pulleys. "The better the light, the quicker the make ready," says the printer.

It is with a deep feeling of relief that one steps from the old-fashioned belt-driven press room into the modern, bright, clean, motor-driven press room.

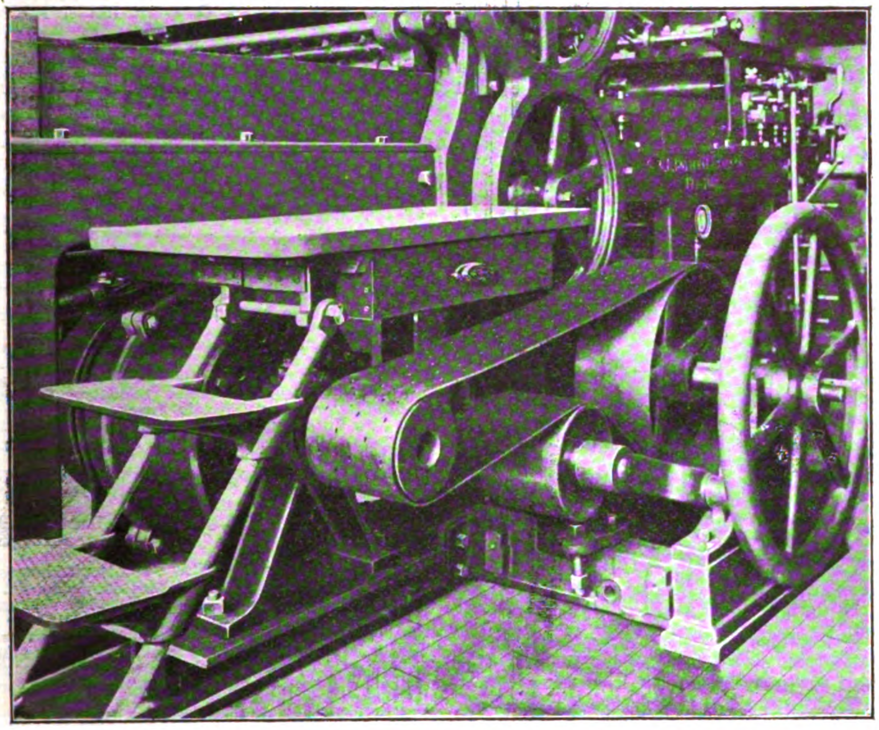
Fast-flying belts endanger life and limb, and an occasional countershaft torn down is liable to cause serious damage. There is no danger with an electric motor. It is compact and simple, and requires no technical knowledge on the part of the operator. The pressing of

Digitized by Google

a button or the turning of a handle is all that is necessary.

Equipping presses with electric motors permits the presses to be arranged and placed to the best advantage and results in economy of floor space, with better light and air. The Lundell motor is of such compact design that it occupies less floor space than any motor of the same power on the market.

Each press or machine is under the absolute control of the operator. The controlling apparatus supplied may be of either of two kinds. For the large machines, requiring large motors, and where the variations of speeds must be very exact and minutely subdivided, a rotary form of armature controller with a separate field rheostat is supplied. This rotary controller is of the cylinder type, made very heavy, and is similar in appearance to the ordinary street car controller. The controllers are arranged to give from five to nine forward, and from two to nine reverse running positions.



FIVE HORSE-POWER LUNDELL MOTOR BELTED TO NO. 10 COTTRELL PRESS.

The field rheostat, being independent of this main controller, can be used to give twenty or more intermediate speeds between each running position of the main controller, so that the operator can readily procure from 100 to 180 operative speeds in a forward position, and from 40 to 180 in a reverse direction, depending upon size and type of controller used.

This makes it possible to select the exact speed most suitable for any purpose.

This form of equipment can also be supplied with an automatic over and underload circuit breaker, which protects the machine from overloading, and cuts off current when the supply is interrupted.

For intermediate and small work, a simpler controller is used which consists of an armature and field rheostat controlled by a single lever. This device is fitted with an automatic release which cuts off current in case of overload or in case of interruption of the current.

The number of speeds obtained for this type of controller vary from ten to fifteen forward, and two to four reverse speeds.

Both forms of controllers, are fitted with renewable contacts, the very highest grade of insulation, and are arranged to prevent burning of contacts or injurious arcing.

The motors are steel clad and completely enclosed, making them practically dust and waterproof, protecting the working parts from injury which might be caused by an accumulation of dust, or the careless dropping of a hammer, or wrench, or other object. As constructed these motors are practically invulnerable to accidents or injury.

THE ELECTRICAL EQUIPMENT OF THE R. & H SIMON CO. SILK MILLS, UNION HILL, N. J.

The application of electricity to various uses in mills and factories is increasing with such regular and lengthy strides that it has become one of the distinctive problems of electrical engineering, and the subject is one of such interest to many, that a brief description of the following individual case will be worthy of notice.

The plant under consideration is that of the R. & H. Simon Co., silk manufacturers, on Gardner street, Union Hill, New Jersey.

The conditions to be met were similar to those arising in many mills during these years of constantly increasing business. A large addition was to be made to the buildings, and this addition was to be supplied with light and power. The two horizontal engines, one of 150 hp., and the other of 75 hp., were used for driving the shafting throughout the mill, as well as the generators which supplied current for lighting the buildings. The steam plant was already loaded well up to its limit during the early morning and late afternoon, and the engine room afforded no space for the installation of additional units.

These facts led to the consideration of a storage battery, and immediately it became apparent that a battery would not only obviate these difficulties, but would add many advantages to the electric and power equipment. Thus it was seen, that the installation of more steam apparatus would require the firing of an extra boiler twice a day, for one or two hours only, in the morning and afternoon, when the maximum loads occurred. Were a battery used, however, the surplus energy during the hours of light load could be stored and used to assist the generators when the peak loads came on. The large saving in fuel accomplished by this method formed another strong argument in favor of the battery.

Then, too, it was apparent that a battery meant electric service at any time during the twenty-four hours. This feature fell right in step with the proposed installation of motors throughout the mill to supplant the shafting. Thus it would be possible to run a machine here or there after working hours, without the necessity of running the engines, or wasting energy in driving idle shafting. The steam plant could shut down and the engine and boiler room force go home when the whistle was blown, and yet power and light could be supplied for various machines. The office also could be lighted up after hours.

Another argument in its favor arose from the desire of Mr. Simon to run wires from the

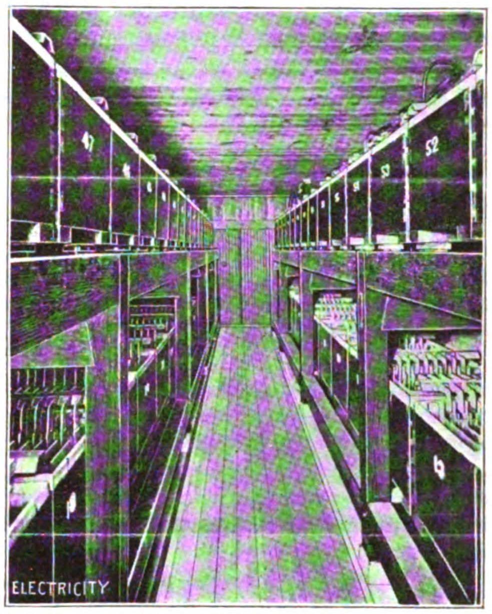


FIG. 1.—SIXTY-FOUR CELL STORAGE BATTERY.

battery to his residence, which is in the immediate neighborhood, and thus obtain light both day and night.

Finally, as one last inducement for the installation, it was taken into consideration that the battery would stand behind the generating machinery as a reserve in case of accident.

With these facts in mind, it was decided to install a battery, and as a result the R. & H. Simon Co. now possesses an isolated plant modern in every particular and one whose flexibility leaves little to be desired. All the advantages expected from the installation of this plant have materialized. The battery has given complete satisfaction on the different classes of service for which it was designed.

The battery (Fig. 1) was installed by the Electric Storage Battery Company, of Philadelphia, and consists of 64 cells of 640 ampere hour capacity, the voltage being 110. Each cell consists of 17 plates 10½ inches square, suspended in acid contained in lead-lined wooden tanks, having outside dimensions of 21¾ inches wide, 15 inches long and 17¾ inches high. These cells are mounted upon two parallel wooden racks, each rack supporting two tiers of 16 cells each. The battery occupies

a room to itself next to the engine room. By means of a cable it is connected to the battery switchboard and to a small belt-driven booster.

LEGAL NOTES.

Judge Martin Bell, of Blair County, Pa., recently rendered a decision of importance upon the rights of the majority and minority stockholders in a corporation. Fifty-three per cent. of the capital stock of the Edison Electric Illuminating Company of Altoona, Pa., is owned by the Electric Company of Philadelphia, Colonel A. Loudon Snowden, Joseph B. McCall and other Philadelphia capitalists. Forty-seven per cent. of the capital stock is owned by Altoona capitalists. The minority stockholders, who were in control of the company, sought to issue 650 shares of new stock and auction the same to the highest bidder. The Philadelphia capitalists secured an injunction, alleging that their rights as majority stockholders were being endangered by this procedure. The Court made the injunction perpetual, holding that majority stockholders have a right to a majority of new stock at a fair market value, so as to preserve their control, and that the tendency of auctioning stock is to give the minority an unfair advantage over the majority. The electric plant in dispute is valued at $1,000,000.

CANADIAN NOTES.

The Cataract Power Company, of Hamilton, Ont., has made a proposition to the council of that city involving the construction of an electric railway from Hamilton to the cities of Galt and Guelph, Ont.

It is reported that the B. C. Gold Mine, Summit Camp, British Columbia, has purchased the water-power at Cascade. The power is being developed by the Cascade Water and Light Company. The falls are capable of developing 20,000 horse-power. The principal owners of the B. C. Mine are Jas. Ross and C. J. McCuaig, Montreal.

Mr. R. J. Parke, consulting engineer of Toronto, has been engaged by the municipal council of St. Mary's, Ont., to prepare plans and specifications for the reorganization and combination of the present municipal arc lighting plant and the incandescent lighting plant recently acquired by the town from the Reesor Company. A new power station will be erected and a completely new engine and boiler plant purchased and installed.

Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended August 18:

Antwerp, 24 packages, $2,770; Brazil, 92 packages, $9,871; British Possessions in Africa, 12 cases, $1,476; 12 packages, $1,713; British West Indies, 16 packages, $268; Brussels, 1 package, $246; Canary Islands, 48 cases, $327; Central America, 50 cases, $813; Chili, 13 cases, $474; Christiana, 6 cases, $550; Cologne, 12 cases, $605; Copenhagen, 11 cases electric motors, $413; Cuba, 31 cases, $892; Dundee, 8 cases, $1,052; Ecuador, 3 cases, $66; Genoa, 5 cases, $110; Hamburg, 171 packages, $10,456; Havre, 77 cases, $9,923; Hayti, 2 packages $13; Huddersfield, 11 packages motor trucks, $2,189; Hull, 22 cases electric motors, $3,885; Japan, 2 cases, $170; Liverpool, 112 packages, $6,738; 150 cases motors, $9,656; 5 cases, $210; London, 337 packages, $15,094; 38 packages motors, $1,900; 30 cases trolley poles, $950; 1 case, $92; Marseilles, 23 cases, $1,944; 17 cases motors and parts, $2,000; Mexico, 60 cases, $1,416; 2 reels cable, $477; Newcastle, 52 cases, $7,000; Newfoundland, 10 cases, $313; Norwich, 1 case, $18; Nova Scotia, 3 packages, $35; Peru, 15 cases, $573. Plymouth, 1 case, $5; Porto Rico, 59 packages, $5,916; Rome, 1 package insulators, $8; Santo Domingo, 17 cases, $274; Siam, 3 packages, $426; Southampton, 25 cases, $1,390; St. Petersburg, 1 box electric motors, $135; 35 cases, $3,123; Venezuela, 51 boxes, $138; Wiborg, 68 packages, $1,282.

PERSONAL MENTION.

Dr. L. E. Niles, president of the National Electro Magneto Telegraph Company of Springfield, O., has returned from New York, where he has been making arrangements looking to the organization of a construction company which will manufacture Inventor L. G. Woolley's apparatus for telegraphing without batteries.

Hon. Benj. B. Odell, Jr., was recently elected president of the Consolidated Gas, Electric Light, Heat & Power Company of Newburg, N. Y.

Mr. John Marsden Ward, agent of the Shah of Persia, is now in this country examining the electric trolley systems of Greater New York preparatory to introducing electric travel between Teheran and a port on the Caspian Sea.

Mr. Eugene S. Apgar, having spent two years abroad as electrician for the Moss Electric Company of Boston, recently returned to his home in New Haven, Conn.

INCORPORATIONS.

The Bruckner Electric Company of New York City. Capital stock, $50,000. Directors: F. C. Bruckner and Paul Sheldon, of New York City, and W. L. Eastman of Woodside, L. I.

The American Electrical Amusement Company, Riverside, N. J. Capital stock, $1,000,000. Incorporators: F. Schwabenland, of Riverside; P. Morris and G. Richards, both of Philadelphia, Pa.

The Williams Electric, Steam & Water Gauge Company, East Orange, N. J. Capital stock, $125,000. Incorporators: Frederick Williams, Charles L. Abbott, Alfred R. Fulton and John W. Brittan.

The South San Francisco Power & Light Company. South San Francisco, Cal.—to furnish electricity. Capital stock, $50,000 Incorporators: L. Hough, W. Clayton, J. W. Lilienthal, W. J. Martin and W. E. Dennison, all of San Francisco.

The Philadelphia Electrical Banjo Company, Newark, N. J. Capital stock, $30,000. Frank T. Creamer, of Newark, is president and treasurer; Samuel Sweet, of Long Branch, secretary. The officers and Fannie M. Bird are the incorporators.

The Electrical Maintenance & Inspection Company, Camden, N. J.—to inspect and maintain electrical devices, especially watchmen's clocks. Capital stock, $10,000. Incorporators: W. J. Caves, G. P. Steel, John Allen and Clifton P. Cornwell.

The Chillicothe Construction Company, Chillicothe, O.—to manufacture and build electric railways. Capital stock, $10,000. Incorporators: O. F. Dillman, J. M. Tomlinson, S. K. Pine, G. K. Cetone and J. K. Newcomer.

ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U. S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

LETTERS PATENT ISSUED AUGUST 14, 1900.

ELECTRIC RAILWAYS AND APPLIANCES.

656,029. Electric Automatic Controller and Indicator for Railways. Vito Leto, Newark, N. J. Filed Sept. 14, 1899.

656,030. Trolley for Electrically-Driven Vehicles. Louis Lombard-Gerin, Lyons, France. Filed Jan. 9, 1900.

656,125. Bond for Track-Rails. Henry F. A. Kleinschmidt, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Dec. 28, 1899.

ELECTRIC LIGHTS AND APPLIANCES.

655,762. Insulated Hanger for Arc Lamps. George Cutter, Chicago, Ill., assignor to the George Cutter Company, same place. Filed May 4, 1900.

655,808. Electric-Arc Lamp. Bernard A. Stowe, Cleveland, O., assignor to the Jandus Electric Company, same place. Filed July 10, 1899.

656,077. Manufacture of Incandescent Materials for Electric Lighting. Georg Alefeld, Darmstadt, Germany, assignor to Ludwig Wilhelm Gans, Frankfort-on-the-Main, Germany. Filed June 15, 1899.

656,115. Incandescent Lamp. Christian Hoelscher, Warren, O. Filed May 30, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

655,703. Device for Registering Electric Currents. Victor G. Fuller, Toulon, Ill. Filed Dec. 16, 1899.

655,852. Electric Motor. Patrick J. Collins, Scranton, Pa., assignor to the Collins Electric Vehicle Company, same place. Filed Dec. 1, 1899.

656,105. Circuit-Breaker. Frank W. Garrett, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Dec. 1, 1899.

656,127. Dynamo-Electric Machine. John D. Spence, Somerville, Mass., assignor to Charles L. Cotton, Dedham, Mass. Filed May 12, 1899.

TELEPHONES AND TELEPHONE APPARATUS.

655,726. Telephone Receiver. William J. Murdock, Boston, Mass. Filed April 11, 1900.

655,772. Telephone Toll Apparatus. William A. Foss, Cleveland, O., assignor to the American Toll Telephone Company, same place. Filed Feb. 26, 1900.

655,810-655,811. Telephone Exchange System. Alfred Stromberg and William M. Davis, Chicago, Ill., assignors to the Stromberg-Carlson Telephone Manufacturing Company, same place. Filed April 26, 1899, July 13, 1899.

655,849. Telephone Bell Cut-Out. Luther F. Cobb, Providence, R. I. Filed Jan. 6, 1900.

655,916. System for Individual Service on Electrical Party-Lines. William Torst, Jr., Los Angeles, Cal., assignor of one half to William P. Mooney, San. Pedro, Cal. Filed Sept. 25, 1899.

655,992. Indicating-Device for Telephone-Receivers. William R. Rathvon, Florence, Col. Filed Nov. 28, 1899.

MISCELLANEOUS.

655,716. Telegraphic Relay. Isidor Kitsee, Philadelphia, Pa., assignor to Charles E. Wilson, same place. Filed May 20, 1899. Renewed Dec. 21, 1899.

655,747. Electromedical Vacuum Apparatus. George W. Winckfield, Alameda, Cal., assignor of one fourth to George C. Fabens, same place. Filed Nov. 29, 1899.

655,763. Annunciator. William M. Davis, Chicago, Ill., assignor to the Stromberg Carlson Telephone Manufacturing Company. Filed Dec. 15, 1899.

655,769. Storage Battery. George A. Ford, Cleveland, O. Filed Sept. 5, 1895.

655,777. Electrical Sign and Signal and Apparatus for Operating Same. Anatole Heiny, San Francisco, Cal., assignor of two-thirds to Joseph E. Artigues and Dominique G. Lucien, same place. Filed Sept. 26, 1899.

655,779. Control of Electric Furnaces. William S. Horry, New York City, assignor to the Union Carbide Company, Niagara Falls, N. Y. Filed Feb. 21, 1899. Renewed Jan. 15, 1900.

655,780. Electric Furnace. William S. Horry, New York City, assignor to the Union Carbide Company, Chicago, Ill. Filed Aug. 15, 1899.

655,783. Electrolytic Apparatus for Decomposing Metallic Salts. Carl Kellner, Vienna, Austria-Hungary. Filed March 3, 1896.

655,809. Signaling Apparatus and Circuit Therefor. Alfred Stromberg and Androv Carlson, Chicago, Ill., assignors to the Stromberg-Carlson Telephone Manufacturing Company, same place. Filed April 26, 1899.

655,824. Brush-Holder. Hermann F. T. Erben and William B. Potter, Schenectady, N. Y., assignors to the General Electric Company of New York. Filed Aug. 29, 1898.

655,838. Method of Insulating Electric Conductors. Nikola Tesla, New York City. Filed June 15, 1900.

655,883. Receptacle for Secondary Batteries. Joseph Middleby, Jr., Malden, Mass., assignor of one half to George E. Hatch, Quincy, Mass. Filed April 24, 1900.

655,905. Wire-Joint and Method of Manufacturing Same. Francis W. Maxstadt, Chicago, Ill. Filed June 11, 1900.

655,968. Voltaic Cell. Eugene M. Fishell, Cleveland, O., assignor to the National Carbon Company, same place. Filed Jan. 20, 1900.

656,004. Automatic Resistance-Reducing Device. George H. Whittingham, Baltimore, Md. Filed Dec. 4, 1897.

656,012. Electric Launch. Jacob C. Chamberlain, New York City. Filed March 27, 1899.

656,076. Method of Electrostatically Measuring Currents in Working Circuits. George L. Addenbrooke, London, England. Filed May 7, 1900.

656,091. Electrically Operated Railway-Gate. George D. Burton, Boston, Mass., and George W. Steiner, New York City. Filed April 22, 1899.

656,095. Plate for Secondary Batteries. John B. Conrad, Chicago, Ill., assignor to the Hewitt-Lindstrom Motor Company, same place. Filed March 9, 1900.

656,100. Electricity-Meter. Paul Eibig, Berlin, Germany, assignor to Martin Behrendt, same place. Filed Jan. 20, 1900.

656,128. Method of Regulating Dynamo-Electric Machines. John D. Spence, Somerville, Mass., assignor to Charles L. Cotton, Dedham, Mass. Original application filed May 12, 1899. Divided and this application filed Jan. 22, 1900.

656,156. Method of Producing Carbid of Calcium, etc. William S. Horry, New York City. Filed March 4, 1899. Renewed Jan. 15, 1900.

COMMERCIAL PARAGRAPH.

Dixon's Silica-Graphite Paint has been known and used for nearly forty years—each year better known and each year more largely used. Those who have used it once will use it again, and at all times recommend it. As a protective paint it is without an equal—an ideal and practically indestructible pigment ground in pure, fire-boiled linseed oil of the best quality, and that only. Insist on having Dixon's Ready Mixed Silica-Graphite Paint. Don't let your dealer or your painter mix it for you, as not one dealer or painter in ten can supply an oil of the same quality.

Digitized by Google

THE TELEPHONE WORLD.

Indiana's Inter-State Telephone Association.

The convention of the independent telephone lines in Terre Haute is said by those attending to have been the most enthusiastic session of the Inter-State Telephone Association yet held. The main result of the convention was that an understanding was reached for a basis by which all the independent lines are to have connection and there is to be a free interchange of business, which means that Terre Haute is to be connected directly with 500 towns in Indiana and Illinois. Representatives were present from the independent telephone exchanges at Chrisman, Rockville, Casey, Danville, Hume, Clinton, Ridge Farm, Oakland, Kansas, Marshall, Greencastle and Mattoon. By the building of a line to Marshall, which is to be done, Terre Haute in the next year will be strictly in it so far as independent telephone service is concerned. General Manager Colt of the Citizens' Telephone Company is quite happy over the outlook, as it means much for his company in the way of outside connections.

The Kinloch Long Distance Telephone Company is now building a line from St. Louis to Indianapolis through Terre Haute and this will also be connected with the independent telephone companies. A company at Indianapolis is building one to Cleveland and Buffalo, and independent exchanges are being put in at Philadelphia, Baltimore, New York and Boston, with which, when the circuit is finished, Terre Haute will be connected.

The independent company at St. Louis has communication as far west as Kansas City and St. Joe so that to the west the Terre Haute Independent Company will be right in it when the line is completed from St. Louis to Terre Haute. In going through Terre Haute the Kinloch Company will use the wires of the Citizens' Telephone Company. The vast circuit that is being created independent of the Bell Company will be plain at a glance.

The Citizens' Telephone Company is having a new switchboard made by the American Electric Telephone Company of Chicago, which will serve 3,000 subscribers.

The officers of the Inter-State Telephone Association are: President, C. R. Duflin; secretary, H. A. Colt; treasurer, J. B. Connelly, of Rockville.

Secretary Ware of the Citizens' Telephone Company of Grand Rapids, Mich., recently made a trip to Jackson, Mich., in the interest of the independent companies. While in Jackson he heard of the combining of the Ann Arbor independent company with the Michigan Company. Mr. Ware went to Ann Arbor to look over the situation and found rather peculiar circumstances. The independent company of Ann Arbor which had more 'phones than the Michigan Company was sold out by the Detroit stockholders to the Michigan Company, and Manager Keech of the Michigan Company was made manager of both exchanges. It is now intended to consolidate the exchanges by replacing the independent telephone by the Bell 'phone at the same exchange rate. Mr. Ware says, however, that the change of 'phones cannot be made legally. If the Ann Arbor people should decide to retain their independent telephones, the Michigan Company would be compelled to leave them, as a State law forbids a change unless the person having the 'phone permits it.

The Fluvanna Telephone & Telegraph Company of Palmyra, Va., now has connection with the Louisa Telephone Company, and also long distance connection with Richmond. The company is now building an extension line to connect with the Albermarle telephone, which is hoped to be completed in thirty days. When this line is finished it will give connection to Charlottesville and Albermarle County. Although the Fluvanna Company is only about a year old, yet it has fairly covered the county with lines, has equipped a nice exchange, and has one of the best-constructed systems in Virginia.

The Northeastern Pennsylvania Telephone Company of the borough of Thompson, Susquehanna County, Pa., has been chartered with a capital of $16,000 to construct telephone lines in the counties of Susquehanna, Wayne and Lackawanna. The directors are A. H. Crosier, S. S. Hubbard of Thompson, W. W. Munford of Starrucca, H. W. Kessler of Brandt, and F. E. Osgood of Forest City.

J. W. Martin, manager of the Oakland County Telephone Company, has made a proposition to build and equip an independent telephone system in Pontiac, Mich., with State connections and first-class service at the same rates that were charged by the Detroit company, and he will have the line in operation in six months.

Subscriptions for a new telephone system to compete with the Wisconsin Telephone Company have been raised in part, $30,000 of $60,000 being assured. The new company, to be known as the Racine Mutual Telephone Company, will soon be incorporated.

An automatic telephone pay station has been installed in the Hamburg-American line steamship Augusta Victoria, at the pier in Hoboken, N. J. All that is necessary to be done to connect the steamer with the telephone system is to insert a plug in its proper place on the deck. This is the work of a second. No attention from the telephone company's employes is required. The connection is made with the Hoboken central office. The system gives passengers leaving for Europe opportunity to transact business up to the very moment of sailing, as it is designed to disconnect the telephone at the same moment the lines are cast off. If the scheme works well similar stations will be placed on the other steamers of the Hamburg-American line.

The franchise of the Citizens' Telephone & Telegraph Company of Worcester, Mass., is in the hands of City Solicitor A. P. Rugg, who will prepare it in connection with the committee appointed from the board of aldermen. There has been some talk of running the wires of the new company through the conduits of the New England Telephone & Telegraph Company, in order to avoid the necessity of digging up the streets again. There is some question, however, as to whether the New England Company could be forced by the aldermen to allow a competing line to use its conduits in this manner. It is also doubtful as to whether there would be enough room in the New England's conduits for all the wires the new company will use. One thing is fairly certain, very few wires will be strung overhead by the new company.

At the meeting of the International Railway Congress, which is to be held in Paris, the subject of the use of telephones on railroads will be taken up and discussed. The following resolution is to be presented: "Provided that very simple precautions in the transmission and registration of messages are taken, the telephone affords at least an equal guarantee of safety to that of the telegraph in the exchange of messages peculiar to railway working, that is to say, messages effecting the safety of running the trains. Its advantages or disadvantages as compared with the telegraph, in convenience and economy, depend upon conditions which are peculiar not only to each railway, but even to each branch, for they depend, not only on the magnitude of the traffic, but on the existing telegraph, electric light and electric power mains."

The final organization of the Clark Automatic Switchboard Company for the manufacture and sale of the telephone switchboard invented by Manager Clark of the Iowa Telephone Company in Sioux City, Ia., and perfected by John Van Wagenen, was recently effected. The organization meeting was held at Providence, R. I., and the following officers were elected: President, William B. Banigan; vice president and general manager, E. M. Prindle; secretary, F. A. Seib; treasurer, M. E. Torrey; directors: William B. Banigan, E. M. Prindle, J. Van Wagenen, M. E. Torrey and J. W. Phillips.

The long distance telephone system of Vicksburg, Miss., along the main line of the Yazoo and Mississippi Valley, north and on the Riverside division will be completed to Greenville, Miss., in a few days. The completion of these lines means telephone connection with every point on the river north of Vicksburg on the Mississippi River to New Orleans, and all points north as high as Memphis. The service is spreading to all the interior towns.

H. R. Godfrey is preparing to put in a long distance telephone system that will connect Scottsboro, Ala., direct with Ft. Payne, Collinsville, Chattanooga and many other towns in that section. The long distance line is now built within twelve miles of Scottsboro on Sand Mountain, and will be taken to that place by cable through the Tennessee River. Mr. Godfrey is arranging to establish a local system.

By the action of the stockholders of the Home Telephone Company of Greenville, S. C., the sale of the plant to the Consolidated Telephone Company of South Carolina was confirmed. By this action the Home Telephone Company ceases to be an independent company. George A. Browning, president of the Home Company, has been elected president of the Consolidated Company.

Carthage will soon be the center of the strongest interurban telephone system in Missouri, as arrangements have been made to connect the Pierce City lines, recently purchased by T. J. Hyman of Chicago, with the Springfield and Monet and the Pierce City and Reed's line with the Carthage exchange. When completed, the accommodation afforded the mining regions will not be surpassed anywhere.

The Cumberland Telephone & Telegraph Company has completed a telephone line from Springfield to Turnersville, Tenn., and Springfield is now in touch with almost every part of Robertson County.

The people of Ainsworth, Ia., are quite enthusiastic over telephones. M. L. Miller and J. A. Marsh of that place have organized a company for the purpose of giving the farmers of Oregon and Highland townships a complete service with a central office at Ainsworth. They have been working it up, and have gone in three directions from town, southeast, southwest and northwest. These three will be in conjunction with the line already running northeast. They have secured sixty-five 'phones on the three new lines and in the town of Ainsworth. These in connection with the line already organized with fifteen 'phones will make a central in Ainsworth with eighty 'phones.

The finishing touches on the new telephone line of the Missouri & Kansas Company have been made between Wichita and Haven, Kan., and communication is now open. This line was commenced to Hutchinson in order to accommodate the small towns between Wichita and that point, and from which the company will obtain considerable revenue. This company already has one line to Hutchinson, but the new enterprise will open up a vast amount of undeveloped territory. The work from Haven on to Hutchinson, Kan., is continuing, a force of men being at work all the time. It is the intention to have it finished by September 1st.

The farmers between Randolph and Imogene, Ia., are agitating the question of establishing a telephone line, the proposed line to run south and east from Randolph to Fred Anthony's farm, and thence into Imogene. If this is consummated the farmers southwest of Imogene are quite likely to be possessed of two modern utilities soon, as all applications for free rural delivery routes on file will be acted upon immediately, and the routes granted, if conditions for the routes are satisfactory.

With the installation of the switchboard in the new central office at Two Harbors, Minn., and the completion to Duluth of the Duluth & Iron Range Railway Company's new telephone line, connection can now be had with Minneapolis, St. Paul and Chicago over the Bell Telephone Company's lines from Duluth. The Iron Range system is nearly completed to Biwabik, Minn., and as soon as the switchboard is put in there to connect with the Mesaba Telephone Company's line, Virginia, Biwabik, McKinley, Sparta, Eveleth and Mountain Iron will also enjoy the same connections.

At the annual meeting of the Citizens' Standard Telephone Company at Kingston, N. Y., on the 16th inst., the following were elected directors: John H. Farrell, John M. Bailey, James H. Leake, Jay E. Klock, T. E. T. Mosher, S. N. Frederick, and Cornelius Hill. The officers chosen were John H. Farrell, Albany, president; Jay E. Klock, Kingston, vice-president; James H. Leake, Albany, treasurer; T. E. T. Mosher, Albany, secretary.

It is stated that the Central Railroad of New Jersey and the New York & New Jersey Telephone Company are at loggerheads in Dunellen, N. J., with the result that the extension of the telephone line to New Market has been held up. The railroad company objects to the telephone company's setting poles and stringing wires on property owned by the road. Some poles that had been set were removed.

The Southwestern telephone exchange of Bastrop, Tex., which has been under headway for the last two months, now complete. The town is equipped with a large number of wires. It will be connected with the long distance telephone.

The Tidewater Telephone Company, which has just completed a line from Gloucester Point to Newport News, Va., will now construct a line from Gloucester Point to Tappahannock, Va.

The telephone company has extended its line to Wardlan and Davis Mill, seven miles south of Warren, Ark., and it is proving a great convenience to persons in that vicinity.

The Northwestern Telephone Company of Hastings, Minn., has had its long distance lines connected with the local exchange.

The Bell Telephone Company is erecting a new line from New Wilmington to Volant and Neshannock Falls, Pa.

TELEPHONE INCORPORATIONS.

The West Jefferson Telephone Company, West Jefferson O. Capital stock, $6,000.

The Kandiyohi Telephone Company, St. Paul, Minn. Capital stock, $10,000. Incorporators: P. J. Haley, A. F. Hanscom, J. M. Spicer, J. O. Lundberg and H. B. Eddy.

The Co-operative Telephone Company, Dresden Station, N. Y. Capital stock, $15,000. Directors: R. N. Clemons, Dresden Station; J. A. McLaughlin, Putnam; E. J. Gray, Whitehall.

GENERAL NEWS.

What is Going On in the Electrical World.

LIGHTING.

Bellevue, Ia.—Bellevue will expend about $4,000 on its electric light plant.

Binghamton, N. Y.—A special session of the board of supervisors was held lately, the meeting being called by the committee on county buildings for the purpose of considering the plans and specifications for a steam and electric light plant at the county farm.

Cadillac, Mich.—Extensive improvements are in progress at the Cummer electric light and waterworks plant here.

Chattanooga, Tenn.—The new Southern Hotel of which F. A. Lincoln is manager, will soon be in the market for an electric light plant of about 700 lights.

Corunna, Mich.—A corporation will be organized in this city to be known as the Shiawassee Light & Power Company; the incorporators are to be the present members of the Corunna Electric Company, and H. A. Sprague of Portland. The new concern will be capitalized at $20,000, and work will be commenced at once on the new plant which will be located at Shiawassee.

Covington, Ky.—The question of issuing $50,000 in bonds for erecting an electric light plant will be voted on at the November election.

Dothan, Ala.—H. A. Pearce, mayor, wants bids for material and the construction of an electric light plant of 1,500 incandescent light capacity.

Durand, Mich.—This place is to have an electric light plant.

Fargo, N. D.—The Courtenay mills will have an electric light plant.

Fullerton, Neb.—An electric light franchise has been granted to a Lincoln firm, and it is expected that a plant will be put in soon.

Grass Valley, Cal.—The Electric Power & Light Company's plant was recently destroyed by fire. Loss $2,000.

Hill City, Tenn.—The people here are very anxious to secure waterworks and electric lights.

Hull, Que.—The question of municipal ownership of the electric lighting plant is being revived here, and it will probably be brought to a successful issue.

Iron River, Wis.—The electric lighting plant here was destroyed by fire recently.

Leesville, La.—An electric light plant will be built for the town's supply.

Lenni Mills, Pa.—Wm. Carson & Co. are installing an electric light plant in Parkmount Mill at this place for the purpose of lighting that mill as well as the Brookside Mill nearby. It will be in operation by October 1.

Loveland, Col.—This town is advertising for bids for an electric light plant.

Mattoon, Ill.—A new dynamo, costing $2,350, is to be installed into the electric light plant at this place.

Mora, Minn.—The Morrison electric light plant was recently purchased by the Mora Milling Company, and will be removed at once, and operated in connection with the mill.

Morrice, Mich.—The electric lighting plant destroyed by fire here some time ago is to be rebuilt at once.

Nanuet, N.Y.—There is talk of having electric lights in this town.

Napoleon, O.—The electric light plant here was recently destroyed by fire.

Nelson, B. C.—This city will sell, September 15, $15,000 in bonds for extending the electric lighting system. J. Houston, mayor.

Neoga, Ill.—Bids will soon be advertised for the erection of an electric light plant. J. D. Wallace, engineer, Champaign.

Newmarket, Ont.—A special election will shortly be held to vote on the question of issuing $10,000 in bonds to build an electric light plant and waterworks.

Palestine, Ill.—The village board has contracted with the Chicago Commercial Electrical Company to put in an electric light plant, with a 125 horse power boiler, a 100 horse power engine and a 1,200 light dynamo.

Penacook, N. H.—The Dustin Island Woollen Mills will put in at once an electric plant of 300 horse power capacity. With the electricity generated the mills will be lighted and power furnished for the extra demands upon the mills.

Radford, Va.—Bids will be received until September 1 for enlarging the plant of the Radford Electric Light & Power Company so as to operate about 100 2,000 cp. arc, and 3,000 16 cp. incandescent lights to cost about $20,000. Address F. S. Pickle, secretary.

Rhinebeck, N. Y.—A first class electric plant is now an assured fact here.

Riverside, Cal.—An electric light plant will soon be built by this city. Messrs. Morse and Peters are investigating as to cost, etc.

Shelby, Ala.—The Shelby Iron Company will erect an electric light plant at its works.

Spirit Lake, Ia.—B. F. Stevens, of St. Louis, has made Spirit Lake a present of an electric light plant.

St. Joseph, Mich.—The city council has unanimously passed a resolution authorizing the ordinance committee to ascertain about the cost and construction of an electric lighting plant.

St. Mary's, Ont.—An engineer has been appointed to prepare plans for the proposed new electric light plant and bids will be asked for soon.

Tamaqua, Pa.—Bids will be received by the town council until September 5 to light the village. Any practical street lighting system will be considered. Address W. F. Leopold, town clerk.

Wellsburg, W. Va.—The Wellsburg Electric Light Company proposes in the near future to rewire the town and place a new 100 power engine in its plant, so as to be able to furnish current day and night.

Westwood, N. J.—The electric light plant is to have a new engine of greater capacity than the old.

West Lafayette, Ind.—The light committee of the city met recently at the call of Chairman Manning to consider the matter of lighting the city with electricity. The committee will report at the next meeting of council when it is expected the matter will be finally disposed of.

Wrightsville, Ga.—This city has voted in favor of the proposed issuance of $15,000 for erecting an electric light plant.

STREET RAILWAYS.

Albany, N. Y.—It is stated that an agreement has been made between the United Traction Company and the Schenectady Railway Company by which the latter will construct a trolley line to this city.

Ashland, Pa.—The matter of constructing a trolley line from here to the State Hospital, and which will eventually reach Gordon, is being considered by certain men who build railroads.

Austin, Tex.—I. B. Crearer, F. H. Fitch and Judge A. G. Mosely of Denison were here lately in consultation with Attorney General Smith with a view of securing a charter for a corporation to construct an electric road between Denison and Sherman.

Black Hawk, Col.—The wire for the electric trolley system of the Boston and Denver Mining & Milling Company has been received and the trolley poles wired. The electric motor, which is now in place, has enabled ore cars to pass through the Bobtail and Bates hill tunnel to the company's new mill.

Caldwell, N. Y.—At a recent conference between the highway commissioners and those interested in the construction of the proposed electric road between Warrensburg and this place, it was decided to run a new line through the northern part of this town, which is believed to be more beneficial to a larger number than the proposed route.

Chattanooga, Tenn.—The Chattanooga Electric Railway Company has decided to extend its line to Sherman Heights. D. W. Warner is president of the company.

Chester, Pa.—It is said the arrangements for the construction of the trolley line from this city to Essington are about finished and the work will be started in the near future.

Dayton, O.—It is stated that the Dayton, Springfield & Urbana Electric Railway Company's plant may be purchased by the American Railway Company of Philadelphia, which owns the Springfield railway system.

East Hampton, Conn.—One of the features of the new electric road between here and Moodus will be the moving of freight.

Lapeer, Mich.—R. G. Hart and W. G. Brown of this city have assigned their interests in the Detroit, Oxford, Lapeer & North Branch Electric Railway to Daniel R. Currey of Rochester and Ed. S. Grece of Detroit, who say they will push the road to completion at once.

Marion, Ind.—Engineers have been started out over the right of way of the proposed electric railway between Hicksville, O., and this city passing through Ft. Wayne and Huntington.

Martinez, Cal.—The board of supervisors of Contra Costa County recently granted to A. S. Macdonald and W. G. Henshaw, of Oakland, a franchise for an electric road from Point Richmond to the Alameda County line. Work on the construction of the road will begin at once.

Meriden, Conn.—Rus Williams of this city has a plan for equipping the Waterbury railroad with electricity, which would save it $15,000, he says, and add to the receipts at least $1,000 a year.

Montgomery, Ala.—F. C. Ayres is interested in a proposed electric line in the suburbs of Montgomery.

Morristown, Ind.—The town trustees recently granted a right of way to the Indianapolis, Morristown & Rushville Electric Railway Company for a line to this city from Indianapolis. Work is to begin in six months.

Muncie, Ind.—J. M. Gore is the promoter of the right of way of the Indiana & Ohio electric road between this city and Portland.

Pittsburg, Pa.—The extension of the Westmoreland street railway trolley line from Manor to this city is an assured fact.

Ravenna, O.—The council lately granted a franchise to the Portage Lakes Traction Company to construct an electric railroad here. It is conditional that the line be extended to Cleveland and Kent before December 31, 1901, or the grant becomes forfeited.

Ripon, Wis.—The council has acted favorably on a petition of Chicago capitalists for the construction of an electric line to the north and south shores of Green Lake. The line will be ready next spring.

Rochester, N. Y.—The promoters of the Buffalo, Niagara Falls & Rochester Electric Railway have secured the necessary rights of way and the company will apply for permission from the State Railway Commission to begin the construction of the road. Articles of incorporation have been prepared. The company is to be capitalized at $3,500,000. The directors are A. D. Beach of Watertown, W. H. Gillett of Charlotte, C. S. Barker, G. L. Brown and others.

Stafford Springs, Conn.—New interest is now being taken in the proposed electric road.

St. Louis, Mo.—The Elevated Railway Construction Company has recently been incorporated with $100,000 capital stock to build an electric railway in this city. J. L. LaPrelle and C. W. Sargent are interested.

Toledo, O.—All the right of way for the Toledo, Port Clinton & Lakeside Electric Railroad has been secured and franchises are now being obtained through the towns along the route.

Two Rivers, Wis.—At a recent meeting of the city council T. Higgins, of Neenah, applied for a franchise for an electric street car line.

Tyrone, Pa.—The village council has passed an ordinance granting a franchise for the use of certain streets to the Tyrone Electric Railway Company.

MANUFACTURING.

New York City.—The Sprague Electric Company reports an increasing business along all the lines of its manufactures. The Lundell fans have had a big sale, and the sales in the Interior Conduit department have exceeded all previous seasons. Among other orders received for motors and generators is one from the Cooke Locomotive & Machine Company of Paterson, N. J., for a standard 300 kilowatt split pole generator of the belted type. The company has just issued a revised edition of the bulletin describing the Greenfield flexible steel armored conductors. It contains additional illustrations and prices.

COMPANY MATTERS.

Ottawa, Ont.—The Ottawa Electric Company, the works of which were destroyed by fire a few months ago, have completed arrangements for its reconstruction on a large scale. When the new plant is fully installed more than two-thirds of the machinery, etc., will be of American make.

Portsmouth, N. H.—The Gibbs Electric Signal Company held a meeting recently, and after accepting the articles of incorporation of the company, proceeded to elect officers. The board of directors were elected as follows: Henry C. Anthony, A. Lincoln Hambly, Frank G. Sweeney, Harry T. Gibbs, and Stanton M. Foye. By-laws were adopted, and a meeting of the board of directors was held after the regular meeting, at which Henry C. Anthony was elected president of the company, A. Lincoln Hambly, secretary and treasurer, and Harry T. Gibbs, general manager.

Springfield, O.—The National Electro-Magnetic Telegraph Company, of which Dr. Niles is president, will be reorganized next month into a construction company.

POWER AND TRANSMISSION PLANTS.

Oroville, Cal.—The Yuba Power Company has incorporated under the name of the Bay Counties Power Company, and new and powerful machinery is being put in. It is estimated that this company will generate 50,000 horse-power, which is to be sent to Napa City and to other places near the coast.

Walla Walla, Wash.—At a recent meeting of the city council T. J. Kirk, of Athena, and his associates requested permission to erect poles, wires and conductors for the purpose of transmitting electricity for light and power in this city.

MINES.

Rossland, B. C.—The new management of the Hall mines is considering the use of electric power instead of steam power, as heretofore, for its plant and machinery at the mine, and possibly at the smelter. L. A. Campbell is interested in the project.

AUTOMOBILES.

Detroit, Mich.—Articles of association were recently filed with the county clerk by the Automobile Rapid Delivery Company of this city with a capital stock of $25,000. The officers of the new company are John W. Goodson president, and Hamilton O. Davis general manager.

New Orleans, La.—Mr. E. W. Tucker is at the head of an automobile system, which is to be established here, much after the fashion of those now plying in New York and some other Northern cities.

The Chicago Union Traction Company has substituted coal for oil in its firerooms.

It is thought that the Philadelphia Electric Company will retire $2,000,000 of its 4 per cent. bonds.

The annual meeting of stockholders of the American Railways Company will be held September 20.

The books close for the annual meeting of the Southern Light & Traction Company on September 11 and reopen October 2.

The Brooklyn Elevated Railway was sold at auction under foreclosure on August 15 for $174 837 to the Brooklyn Union Elevated Railroad Company.

The net earnings of the Pittsburg & Birmingham Traction Company for the fiscal year increased 53.75 per cent. There was practically no increase in operating expenses.

The members of the New York Stock Exchange Monday voted favorably on the petition circulated last week for the closing of the Exchange on the Saturday preceding Labor Day.

The United Traction Company of Albany, N. Y., has obtained a writ of certiorari against the State Board of Tax Commissioners in an effort to reduce its assessment by more than half.

The Kings County Electric Light and Power Company has declared the regular quarterly dividend of 1½ per cent., payable September 1. Books close August 22 and reopen September 1.

A deal has been closed for the consolidation of the street railway and electric plants in Dubuque, Ia., under a new company, which has a capital of $1,000,000 and a fifty-year charter.

The Elmira Water, Light and Railroad Company reports as follows: (Railroad department): Gross earnings, $20,824; increase, $10,665; net income, $3,571, increase, $3,781; profit and loss deficiency, $13 216.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 13@16; New York Electric Vehicle Transportation, 8@8½; New England Transportation, 3@3½; Gramophone, 35@40.

The report of the Westchester Electric Railway shows: Gross earnings, $13,746; increase, $4 121; operating expenses $12 592; increase $5,904; net earnings, $1,154; decrease, $1,783; fixed charges, $8,194; increase, $975; deficit, $7,039; increase, $2,757.

At the annual meeting of the stockholders of the Calumet and Hecla Mining Company on the 15th inst., the retiring board of directors was re-elected. A resolution was also passed, providing for the extension of the charter and corporate life of the company 30 years, the present charter expiring by limitation April 13, 1901.

The meeting of stockholders of the Pratt and Whitney Company to act upon the proposed "deal" with the Niles-Bement Pond Company was adjourned until September 20. There is apparently no opposition of importance, but it seems difficult work to get at the stockholders. At the last meeting it was found that 22,278 shares, out of a total capitalization of 27,500 shares, was pledged in favor of the combination.

The Montville Street Railway Company, which connects the cities of New London and Norwich (Connecticut), makes the following statement of earnings, from which it appears that the interest charge for the entire year has practically been earned in 10 weeks. from June 5, the opening of the road, to August 12, 1900: Gross receipts, June 5 to August 12, 1900, $19,500; operating expenses (estimated), $7,500; net receipts (estimated), $12,000; one year's interest on its $250,000 5 per cent. bonds, $12 500.

The two most important events in Wall Street the beginning of this week were the death on Monday of John D. Flower and the advance of nearly five points in General Electric. There was a little flurry in stocks when the announcement of Mr. Flower's death was made, not because of any general liquidation, but because the ever restless professional traders were seeking some excuse for raiding the market. As regards the advance in General Electric, the old story of a probable consolidation of the company with the Westinghouse Company was revived, but there seems to be no more foundation for the report now than at any time in the past.

The officials of the American Telephone Company are not as yet prepared to state publicly the amount of deposits of American Bell Telephone stock for exchange into that of the American Telephone and Telegraph Company. A prominent banking house of Boston, however, which is indentified with telephone interests, in a recent private letter to its customers places the amount of American Telephone stock now outstanding at about $90,000,000; the authorized issue is $100,000,000. The market value of the collateral underlying the 4 per cent. bonds of the American Telephone Company is declared to be 33 per cent. in excess of the par value of the bonds issued.

A so-called "preliminary report" for the year ending June 30, was issued by the Brooklyn Rapid Transit Company on August 17. It gives the receipts from all sources as $11,768,550, or $152,517 more than they were in the previous year. The expenses were $11,241,778, or $276 136 less than in the previous year. The net result of the year's operations, therefore, was a surplus of $526 772, or an increase of $728,653, the previous year having shown a deficit of $201,881. The report adds $96,654, designated a "surplus June 30, 1899," to the excess of receipts over expenditures, namely, $526 772, making a total surplus on June 30, 1900, of $623 426. The capital stock is $45,000,000.

All of the reports of earnings which come to hand either of the Third Avenue Railroad proper or its various subsidiary lines demonstrate the beneficial effect of the management which has been installed by the Metropolitan Street Railway. The quarterly report of the Dry Dock, East Broadway and Battery Road shows surplus earnings above all charges and expenses. This property had previously been a drain upon the Third Avenue. The Union Railway, otherwise known as the "Huckleberry Road," also reported a very favorable statement for the quarter ending June 30. According to the figures presented there was an increase in gross income of $37 737 and the insignificant increase in operating expenses of $5,244. Even though charges were $11 348 larger than during the same period last year the balance remaining was $67,466, an increase of $38 145.

A gentleman closely affiliated with the Union Traction Company of Philadelphia, and a large holder of the stock, said on Saturday: "A surplus over fixed charges of $938,000 for the year June 30, 1900, is a handsome gain as compared with $625,000 for 1899 and $25,000 for 1898. Some of the would-be critics have affected to look askance at the large surplus reported in these succeeding years, but it should be noted that now practically every dollar increase in net earnings means a dollar more for surplus, since fixed charges remain the same, and the company is now more than earning them. What I want to point out is that to produce the surplus several times the amount of the preceding year but a relatively small percentage of increase in net earnings was necessary. The company has gotten down to as low a level of operating expenses as it can safely go, and the bigger earnings for the stock are being made by healthy increase in gross receipts."

ELECTRICITY.

Vol. XIX. NEW YORK, AUGUST 29, 1900. No. 8.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4021 Cortlandt.

SUBSCRIPTION RATES:

United States,	$2.50
In Clubs of Five or More,	2.00
Foreign Countries,	4.50
Single Copies,	10 cents

Remit by Express, Money Order, Draft, Post Office Order or Registered Letter.

ADVERTISING RATES.

As Electricity reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application.

Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter

EDITORIAL NOTES.

Official Action Against the Third-Rail.

We are pleased to note that the editorial which appeared in the issue of Electricity of August 15 on the "Third-Rail" has to a great extent been the means of causing the authorities to take some action that would tend to reduce the number of accidents through it in Brooklyn to a minimum. In the editorial referred to it was pointed out that the third-rail system of train propulsion was an excellent one under certain circumstances and one that could not well be gotten along without, but we deplored that more precautions were not taken to prevent accidents through it. We suggested that the third-rail roads in this vicinity be made to adopt the precaution taken by the Baltimore & Ohio Railroad Company on its new third-rail system through the Belt Line tunnel, by encasing the third-rail between two planks set on edge. Our suggestion would seem to have fallen on fertile ground, for Deputy Commissioner James J. Kirwin, of the Department of Public Buildings, Lighting and Supplies, on August 22 issued an order to the railroad companies that they must either make the system absolutely safe or do away with it entirely.

Mr. Kirwin said that he had determined that all danger in the use of the third rail system in Brooklyn should be done away with, no matter what the cost was to the operating companies, or he would institute measures to prevent the use of the contrivance in that borough. His department, he added, had been carefully watching the elevated roads with a view of requiring such additions and alterations as experience proved to be necessary for the safest possible operation of the system. His inquiries on the subject, the Deputy Commissioner declared, had disclosed the fact that a third-rail system, almost identical with that upon the Brooklyn elevated structures, had been maintained upon the New York and Brooklyn Bridge for several years, and he had been reliably informed that it had been generally successful as to both reliability and freedom from accidents.

Mr. Kirwin's department is investigating at least half a dozen suggested methods of "killing" the third-rail system most promptly in case of emergency. He feels confident that the solution is in sight. One proposition was to place the rail in the middle of the track instead of upon the side, and to protect it with upright boards on either side projecting slightly above it. This plan may eventually be given a practical trial. It is understood that Commissioner Kearney has recently directed Bridge Commissioner Shea to either discontinue the use of the third-rail system on the Brooklyn Bridge or to remedy it by placing guards three inches high on either side of it so, as to prevent ready access and contact with it. In connection with this matter it might be mentioned that systems similar to that employed on the Brooklyn elevated structures are now in use on the elevated roads in Chicago and Boston, and also on private rights of way at Atlantic City, Nantasket Beach, Hartford and elsewhere.

The Manhattan Railway Company, it is understood, is preparing to install its third-rail system in a way that will make it absolutely safe. How it proposes to do this has not been made public. We do not see any reason why the third-rail system should be abolished entirely, providing ordinary precautions are taken in shielding the third-rail.

* * *

Again the Brooklyn Bridge and Electrolysis.

At frequent intervals a hue and cry is raised in the daily papers regarding the possible effect of electrolytic corrosion on the anchorages of the Brooklyn Bridge. This state of affairs has been going on ever since Mr. A. A. Knudson discovered some years ago, in making an electrical survey of the Borough of Manhattan, that certain portions of the metal work at the bridge entrance on the New York side were positive to earth.

This periodical electrolysis scare, as it might be termed, has again been resurrected by a number of voltmeter readings recently made, in which it was found that the cables of the bridge were on an average .88 volt positive to earth. With this figure as a basis, the journal which has taken up this matter, argues that as .00238 pound of metal is dissolved per ampere hour; with the amount of current flowing through the structure 52 lbs. of metal are lost by electrolytic corrosion every twenty-four hours, or, in other words, slightly less than 9¼ tons a year. The anchor plates of the bridge are said to weigh in all about 184 tons, which would apparently mean that the bridge would be left entirely without support in a trifle less than twenty years.

Mr. A. A. Knudson, who is recognized as one

of the leading authorities in the country on the destructive action of stray electric currents, referring to this subject says:

"From my knowledge of how stray currents, even of the smallest power, eat and pit the water pipes of cities, I am certain that the stray currents on the bridge must be eating away the structure somewhere. I should say that the trouble was taking place at the anchorages or among the links where the cables are jointed to the anchor plates, if there is moisture there sufficient to carry current. From what we know of underground conduit work it would seem probable there is moisture present. The conclusions arrived at, therefore, are not only possible but very probable."

Another authority, after stating that the anchor plates are imbedded in cement, goes on to say:

"If any one should ask you about that it might be well for you to know that the telephone companies are constantly getting 'grounds' in their wires laid in cement conduits, because of the moisture soaking through the cement. Cement, therefore, is not an insulator and the bridge anchors are not as high and dry as many persons suppose. I might point out another danger. When iron is cast, the heat of it causes the silica in the sand to fuse over its surface a veritable coating of glass. Now this must have been the case with the Brooklyn Bridge anchors, which would then be covered with a glasslike shield, sufficient, you might think to insulate them from corroding currents. But here is a real danger. The glass forms an irregular covering, leaving spots of bare iron exposed. Here is where the electrolytic effects would take place, the current eating holes in certain parts of the anchor plates instead of destroying them evenly all over, and, if I may suggest, very likely shortening that twenty year limit."

We do not agree in every particular with the views of the gentleman just quoted, nor do we think the Brooklyn Bridge would be likely to fall in twenty years, for in order to destroy 9½ tons of metal a year by electrolytic action all the conditions would have to be most favorable. Nevertheless, as the exact progress made by electrolytic action cannot be very well ascertained, owing to the inaccessibility of the anchorages, it behooves the authorities to take some action, and that speedily, to divert any stray current from the cables. This could be done without an enormous expenditure of money, and would set at rest once and for all the periodical cry of "Is electrolysis destroying the Brooklyn Bridge?"

* * *

Scotch Water Power Schemes.

California, as regards the utilization of water power for generating electricity, may justly be termed the Switzerland of America, and it will not be the fault of certain well-known English electrical engineers if Scotland is not ultimately made the Switzerland of Great Britain in this respect. As will be recalled, Lord Kelvin suggested some years ago that the waters from the many lochs in Scotland be made to turn turbines for generating electric current, which could be utilized to advantage for manufacturing purposes in localities where coal was difficult to obtain. Unfortunately, Lord Kelvin's practical views did not meet with the approval of a certain conservative element of land owners, who were wont to spend a limited portion of the year in the mountains of Scotland hunting and shooting. Thus the scheme hung fire, retarded or indefinitely postponed, through the efforts of lovers of the æsthetic.

The promoter's idea was evidently to bring about in Scotland, what has so successfully been brought about in California, by the harnessing of mountain streams. Before the advent of long distance electrical transmission, California, owing to the high price of coal, was unable to support a manufacturing industry of any description, those having the temerity to start up such enterprises invariably failing, owing to the impossibility of successfully competing with products manufactured in the East.

The starting up of such water power plants as that of San Gabriel, San Joaquin and others changed all this and enabled electrically operated factories to be opened, which were more than able to hold their own with competitors outside the State.

Apparently the conditions in Scotland are somewhat similar to those that existed in California, only on a less marked scale, and it is with the idea of placing cheap power within the reach of all that the promoters of the Scotch scheme are still persevering. Referring to this subject our London correspondent says that fancied objections as to the spoiling of natural beauties, and opposition on account of anticipated injury to fishery interests, have temporarily prevailed. This opposition, however, does not discourage the promoter for long together. Encouraged by the sanctioning, though in modified form, of the several electric power schemes, certain leading electrical engineers are just now to the fore front with a project for establishing generating stations for the supply of electrical energy throughout the west of Scotland. A second project is for the supply of electrical energy throughout the industrial districts around Glasgow.

The above is an illustration of how pleasure frequently retards progress.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

A special staff has gone out from Berlin with Count von Waldersee to establish wireless telegraphy in China.

It is understood that Mr. Bostwick will enter his French automobile in the races at Newport, R. I., on September 6, and that he and Willie K. Vanderbilt, jr., will struggle hard for the automobile championship of the United States.

A trust in electricity to control every plant and system in Wisconsin is said to have been planned by Milwaukee capitalists. This company, the articles of which were filed with the register of deeds on the 24th inst., can purchase or get control of everything with which electricity has a connection.

Improved machinery is expected to displace several hundred men in the National Tube Works at McKeesport, Pa., within the next two months. The new machine is for welding couplings, and will revolutionize the making of couplings in every tube works in the control of the National Tube Company. About 300 men are employed welding couplings in the National Tube Works. The new coupling machine is fed by a laborer. One machine will do the work of half a dozen coupling welders. Into it is fed the iron or steel material at one end and it turns out the finished coupling at the other. The machine is operated by electricity, and the welding is done by the same power.

The experiment of using an electric locomotive to replace the ordinary steam one in railroad traffic is to be tried in Michigan. The Grand Rapids & Indiana Railroad has secured a heavy electric motor from the East and will use it to pull the trains on its line between Petoskey and Harbor Springs. Railroad men will await the result of the experiment with considerable interest.

A dispatch from Montreal says the electric car service from Quebec to the Shrine of Ste. Anne de Beaupré has been successfully inaugurated. The cars run at a rate of twelve miles an hour, and there will now be forty-six trains a day.

Electric fans are being introduced in England and are meeting with great favor. In a report to the State Department on the subject United States Consul Halstead at Birmingham says: "The heat wave in London has created an opening for electric fans. Although 'suction' ventilating fans, driven by electricity, are quite well known, I have never seen an electric fan of the cooling type in use in England. I wonder why our manufacturers in this line neglect their opportunity here."

The Old Time Telegraphers' Association will hold its twentieth annual reunion in Minneapolis, Sept. 18, 19 and 20. The reunion will be attended by about 600 telegraphers who were in the business over twenty years ago. The reunion will bring some very prominent people to the Twin Cities. There will be such men as Thomas A. Edison, Andrew Carnegie and Cushman K. Davis. Harry C. Hope. superintendent of the telegraph department of the Omaha Road, is president, and H. A. Tuttle, of the North American Telegraph Company, vice-president.

It is stated in the Portuguese press that Dr. Variot, of Paris, has discovered a process for embalming bodies which he hopes will prove a great success. He not only embalms, but metallizes the bodies by electroplating them. In this manner they can be preserved indefinitely and in such perfection that the most imperceptible wrinkles and lines are reproduced, and the embalmed body has the appearance of a metal statue. In order to electroplate a body it is given a bath in pure carbolic acid, and being strongly rubbed with nitrate of silver, the body is submerged in a galvanic bath, after which a slight layer of nitrate is applied to it.

Master Mechanic W. R. Bullis, of the Chatham, N. Y., and Lebanon Valley Railroad has invented and run a tricycle automobile, the motive power of which is an electro gasoline motor. The machine has been given its first trial, and it operated successfully.

At the shops of the Southern Pacific Railway at Ogden, Utah, says the "Railway and Engineering Review," there was recently installed a 36 horse power Diesel motor, by means of which it is expected to supply power for the machine shop through the use of crude California petroleum. As the use of this type of motor in the West is novel, much interest is

Digitized by Google

being excited by the trial, for the oil fields of California provide much reason for desiring its success. The Diesel motor is essentially a gasoline engine adapted to use crude petroleum or other oils direct. It operates on the 4-stroke or Otto cycle, but differs from other internal combustion motors in compressing a full charge of air to a point above the igniting point of the fuel, then injecting this fuel for a certain period into this red-hot air, where it burns with limits of pressure and temperature under perfect control. There are no explosions, but steady combustion at a predetermined much lower temperature and without essential increase in pressure, the combustion line being practically isothermal.

KALAMAZOO, MICH., has lately been suffering from the worst invasion of grasshoppers ever known in the vicinity. Houses and stores have swarmed with the insects and the people have been driven to their wits' ends to get rid of them. On account of the plague the city authorities were obliged to order the electric current cut off the arc lamps because the hoppers so filled the globes that not a ray of light could be seen and the iron poles became charged with the current.

THE Hendrick Manufacturing Company of Carbondale, Pa., has recently installed a 50 horse power electric motor, which will be used to test the new pumps being turned out by that company.

WE learn that a concession has been granted to the Compagnie des Tramways Mecaniques to construct five new lines from the suburbs of Paris into the city, says the London "Electrical Engineer." The tramways are to be operated by three-phase current at high tension. The general application of electric traction on the Paris tramways should greatly develop the traffic, and is expected to extensively reduce the cost of running.

CONSUL-GENERAL GUENTHER writes from Frankfort as follows: "Steam power is to be superseded by electricity to a very considerable extent in the Government dock yard at Kiel, Germany. After experimenting with electric power transmission on a comparatively small scale, the administration has now decided upon a bolder scheme, whereby all the machine tools, etc., installed in the different workshops are to be electrically driven. To this end a power plant, having a capacity of 3,500 horsepower, is to be erected. This plant will also supply electrical energy for driving the powerful dock yard pumps."

THREE lines of electric omnibuses, intended to compete with the street cars for patronage in all parts of Chicago, are projected. The first electric vehicles will probably be in operation by October. They will be doubled decked, and will have seating capacity for forty passengers. They will take on passengers at any corner along the route until the seats are all filled, and then the vehicles will become expresses and will make no more stops until the downtown district is reached.

TELEGRAPH operators physically fit to pass examination for admission into the United States Army, and who are capable of sending and receiving well enough to handle an ordinary commercial wire, will be received into the service for duty in the Signal Corps. The army is in need of skilled operators, but the physical examination is thorough and it will be a waste of time for men with defective eyesight, under size or pronounced bodily defects to apply. The Government will require a considerable number of telegraph operators to equip the system in Porto Rico, the Philippines and Alaska, as the Signal Corps is likely to have charge of the lines in those countries for a considerable time.

TO DEMONSTRATE the advantages of the motor carriage the storage battery automobile is now being run daily on the streets of Providence, R. I., for the purpose of showing what may be expected of it. The advantages of this form of vehicle are freedom from odors and vapors and ease of operation. Its disadvantage is limited mileage: it is not suitable for long runs across the country; it was designed for service in the city and suburbs, and those who have no occasion to ride more than 30 miles doubtless will find it highly satisfactory.

ONE of the latest improvements in trolley apparatus introduced by the Helios Company of Cologne, Germany, is an ingenious device for lubricating the trolley wire of an overhead system of conductors. It is sufficiently obvious that an effective lubrication of this sort would greatly lessen the wear both of the wire and of the bow or roller collector employed, hence the device in question may find extensive adoption. But that, of course, depends upon the efficiency of the new apparatus, since many unsuccessful attempts have already been made to attain the same end. The latest attempt certainly gives great promise of success, for the apparatus evolved after careful experiment, is said to enable a thin and uniform coating of the lubricant to be spread along the wire. It is of light construction, being of aluminum, and may be carried by the collector arm or independently.

IN a paper recently read before the Physical Society of Frankfort-on-the-Main, Herr Schafer describes a "coherer" designed for use in connection with wireless telegraphy. The coherer is made by pasting strips of tinfoil on a glass plate. If the glass be silvered, it will answer the purpose equally well provided the silvering be divided into strips by a knife. A current of electricity across the metallic strips gave an electric resistance of 50, but when the electric waves impinged on them the resistance was increased a hundredfold. The coherer works in a vacuum.

THE scheme of the Merchants' Exchange to have loaded freight cars conveyed over the street car lines of Buffalo, N. Y., by electricity, to save the time and expense of cartage, is the cause of much comment throughout that city. Prominent wholesale firms strongly favor the adoption of the system, and will assist the Merchants' Exchange in the effort to bring it about.

THE new electric elevator in the tower of the City Hall in Philadelphia will be thrown open to the public about the middle of September or later. This elevator is of the Sprague electric pattern, and upon a pinch fifteen people can be carried in the car. Workmen have taken the slack out of the cables that support the car. These cables stretch considerably when new, and great precaution is required to get the right tension to the wire ropes. The height of the shaft from the seventh floor is about 370 feet. An iron stairway winds about the shaft for the use of sightseers who desire to stop off at intermediate floors, and view the city from the different heights. This shaft is now being enclosed by wooden slats in lieu of wire screens, which are intended to be put in place as soon as councils appropriate the money. The total cost of the shaft, car and machinery is approximated at $25,000.

HOW the busy bee improves the shining hour is quite evident in Denver, Col., as a swarm of the little honey gatherers has taken possession of one of the electric meters belonging to the Gas and Electric Company, much to the annoyance of the latter, saying nothing about the inconvenience they caused the agents who attempted to take the reading of the meter.

The Sixteenth Annual Meeting of the Association of Edison Illuminating Companies.

The following is the programme of the sixteenth annual meeting (twenty-first convention) of the Association of Edison Illuminating Companies, to be held at Grand Union Hotel, Saratoga Springs, N. Y., September 4, 5 and 6. It is expected that the following papers will be presented:

"Some Notes on Electric Elevators," Arthur Williams, New York.

"Systems and Apparatus for Light and Power Distribution," C. P. Steinmetz, Schenectady, N. Y.

"Polyphase Distribution," G. Semenza, Milan.

"Electric Elevators and Electric Hoists," John F. Gilchrist, Chicago.

"The Electrical Features of the Paris Exposition," W. C. L. Eglin, Philadelphia, Pa.

"The Year's Improvements in Meters and Measuring," C. D. Haskins, Schenectady, N.Y.

"Residence Rates in Detroit," Alex. Dow, Detroit, Mich.

"Arc Lighting Systems," Walter Fish, Lynn, Mass.

"Distribution from Transmission Circuits," D. L. Huntington, Spokane, Wash.

"The Past, Present and Future of the Incandescent Lamp," John W. Howell, Harrison, N. J.

"Efficiency of Electric Distributing Systems," F. Torchio, New York.

"Results in the Application of the Maximum Demand Rate System," C. S. Knight, Boston, Mass.

"Twenty-five Cycles vs. Sixty Cycles for Union Lighting Station," C. F. Stott, Buffalo, N. Y.

On Friday, September 7, by invitation of the General Electric Company, the delegates and guests will be taken by special train to Schenectady to visit the works of the General Electric Company.

COMING ELECTRICAL EVENTS.

American Electro Therapeutic Association—Will meet in New York City Sept. 25-27, 1900.

American Street Railway Association—Will meet in Kansas City, Mo., Oct. 16-19, 1900.

Association of Edison Illuminating Companies—Will meet in Saratoga, N. Y., Sept. 4, 1900.

National Association of Municipal Electricians—Will meet in Pittsburg, Pa., Sept. 25-27, 1900.

Old-Time Telegraphers' Association and the U. S Military Telegraph Corps—Will meet in Minneapolis, Minn., Sept. 18, 1900.

Roentgen Society of the United States—Will meet in New York City Dec. 13-14, 1900.

Street Railway Association of the State of New York—Will meet at Buffalo Sept. 18-19, 1900.

DIRT MARKS AND ELECTRICAL CONDUCTORS.*

BY PROF. F. G. BAILY.

In connection with a recent article by Mr. Campbell Swinton (see ELECTRICITY May 16, 1900) on the subject of the accumulation of dirt by electrical conductors, I venture to bring forward some further remarks on the subject, as I have had the phenomenon under observation for some time on a large scale with varied conditions, and the results are therefore fuller and more conclusive. While agreeing fully with Mr. Campbell Swinton that the effect is due to electrostatic action, I may point out that he makes an error (though perhaps only a verbal one) in talking of positive and negative. The following observations show that the sign of the potential with regard to the earth is without or almost without influence on the result.

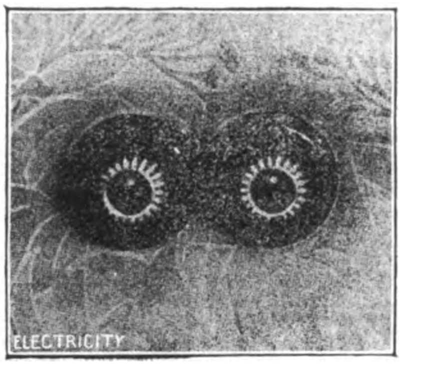
The system in Edinburgh is three-wire continuous current, with the middle wire earthed at the station and 230 volts on each side. Therefore the line wires are positive or negative to earth according as the circuit is connected to the positive and middle or negative and middle. An examination of several hundred lamps in various supports that have been erected for about 18 months showed that the deposit of dust round fittings or conductors was very small in all cases in which the switch was on the live side, though a certain amount of dirt had collected when the conductor passed very close to the ceiling or wall, as for example where flexible passed through eyes. When the switch was on the earthed side the deposit was always large and extended several inches from the conductor. Ceiling roses flexible, and the lamp holders were the most usual obvious cases, but even metal fittings produced the same effect if insulated from the wall. Two movable metal brackets mounted on wooden stands which hung from hooks on the wall showed the same dust marks round the base, and even a piece of string which hung from one of them had a line of dust opposite to it on the wall. These were both on the live side, and the effect is clearly due to leakage from the terminals of the lamp holder over the porcelain insulator to the metal part of the bracket, as there was no direct contact between them. The base of the bracket was of very well seasoned wood polished on all parts, and the room was a particularly dry one, so the conditions were favorable to the retention of electricity on the bracket.

No regular difference could be definitely observed in positive and negative circuits, but there was an indication that the deposit was more on the walls on the negative side, while on the positive side the fitting seemed more covered. This would indicate that the positive charge attracted the dust more than the negative charge, but the difference was not great.

Owing to the difference of potential between the live body and the earth there will be an electrostatic field between them, a charge of electricity positive or negative on the body, and a corresponding negative or positive charge on the earth in the immediate neighborhood. Any small light objects in the surrounding air will therefore be attracted to the charged surfaces. As Mr. Swinton points out, it can be almost completely stopped by putting the switches on the live side (not necessarily the *positive*, however), for when the lamps are burning the live and earthed conductors are very close together, and the earthed conductor forms the nearest earth for the opposite charge. When the conductors pass very close to the ceiling some of the charge is on the ceiling itself, and hence a small amount of deposit is formed there.

The rapid collection of dust on flexible, that is, on the live side is due to the fact that, when the switch is off, the whole of the flexible is charged with one charge, and the lines of force radiate into the air, drawing dust to the body from a large area, while with the switch on the live side, not only is the current on for a small portion of the day, but the two wires are oppositely charged and the lines of force are concentrated between the two, as in two parallel cylinders close together, and hence the area of dust-laden space that is acted upon by an appreciable field is very small. Dust does collect on these, but to a very much smaller extent.

The effect is extremely well shown with switches which are fixed to the wall without projecting back blocks of wood. Round all of these there is a very marked ring of dirt on the wall paper, with a thin line of clean paper close to the porcelain base, as shown in the accompanying photograph. There is evidently slow leakage from the live parts to the metal cover, which is highly insulated from earth by the porcelain base, and also slow creeping of the charge down the base, so that the whole



surface is electrified. The thin line of clean surface, which seems to be always present, is possibly caused by the field being very intense where the charges are so close together, causing the charged particles to be shot off again by electric repulsion. That the marks were not due to the housemaid's duster was clearly shown by the fact that electric bell pushes and gas brackets on the same walls showed no signs of dust marks. Where a switch is near to a side wall the mark appears at the place nearest to the cover, and where the switch is fixed on to narrow casing without any back block the dust appears under the projecting base. The effect is much less marked where polished wood blocks are used, since the dust does not stick to the polished surface and is blown off, or perhaps is repelled off again, and the wall beyond is almost out of reach. Glazed paper and varnished wood wainscoting are almost free from marks.

Since the switch must necessarily be alive, it is a matter of some practical importance, for switches are frequently placed straight on to the wall paper in drawing rooms and other carefully decorated places, and a wall paper is spoilt in a few months. The switch cover should therefore be earthed by being brought down outside the base, so as to enclose it completely. No electrostatic effect can then take place, for the charge will leak away to the wall as fast as it leaks over the insulation inside. It is true that this will lower the insulation of the system, since the insulation in most patterns of tumler switch between the handle and the live parts is somewhat thin. The following test on a small house of 34 lights shows this very clearly. Testing to earth with all wires connected and lamps in, the insulation came out at 50 megohms with a pressure of about 450 volts. The handles of 10 switches were connected by a wire to a good earth, and the insulation dropped to 15 megohms. With a different set of eight switches earthed it fell to 9 megohms, and with 21 switches earthed it fell to 5 megohms. None of the switches were faulty, and they were nearly new and two of the best patterns in the market. They form, however, an undoubtedly weak part in the installation, which is otherwise excellent.

Now that 230 volts is a common pressure I think there is a real need for improvement in the tumler switch; for with the earthed return, which is also becoming usual, a person with delicate hands who is sensitive to shocks may easily receive very unpleasant information that a switch is poorly insulated. The insulation afforded by the base is a bogus and illegitimate one, since it is outside of a part which is intended to be dead, and I trust that some manufacturer will supply a switch that will not give shocks nor make dust marks, one that has an earthed cover and sound ample insulation inside. If the dust question is not heeded, electric lighting will lose some or its claim to be the cleanest form of illuminant.

AUTOMOBILES IN MILITARY USE.

(From the New York Sun.)

The immense advantages presented by automobiles have had a great fascination for progressive military men, but there are great difficulties in the way of their practical application. Nevertheless, all the great nations of the world have studied this subject more or less thoroughly, in order to determine the field, the extent and the limitations of their application in military science and the art of war.

From the consensus of opinions the following brief summary indicates the uses to which automobiles may be put in war.

In the first place, they may be used for transporting rapidly strong detachments from one point to another, either in an advance to seize important points, or in the critical stage of a battle, to outflank the enemy or to pierce his line. There are many difficulties in the way, however, and the practical application in the field is a problem that has yet to be solved.

In France experiments have been carried on under a technical commission since October, 1897, and artillery officers are charged with the duty of following the course of the practical trials, with a view to determining what may find application in the military service.

During the manœuvres of 1898 the reservists were authorized to use automobiles, and the latter were thus subjected to test under the most varied circumstances. Gen. Jamont, for example, after the first battle, dismounted from his horse, entered his automobile and made the tour of the cantonments of his troops, visiting on the way his principal field depot of supply. He was thus able to make in a very short time a circuit of fifty miles and to see for himself, without fatigue, the exact position and condition of his command, a feat which would have been quite impossible with horses alone. The extent of modern battlefields has

rendered it necessary for the commanding general to rely largely on the reports of his subordinate commanders; but the automobile may enable him, as of old, to see for himself at least the most critical part of the field.

In Germany every effort is constantly made to apply in the army the results of all progress in industry, and automobiles have received their share of consideration. During the grand manœuvres of 1899 eight automobiles were placed at the disposition of the commander-in-chief, six of which were assigned to the different general staffs. All these vehicles were tested more particularly late in the evening and at night. On one occasion two of them were sent out in the night with a bundle of printed orders, maps, etc., with a view to having them distributed to the troops before morning. One of the carriages struck a large stone and was rendered useless. The officer in charge of the vehicles put the load of the injured carriage on the other and continued on his way, covering about sixty miles in so short a period that the papers were distributed in ample time.

In February of this year the German Emperor offered a prize of $20,000 for the best military automobile.

In the next place, automobiles are to be used in the transportation of supplies (food and forage) and ammunition, not only in the general train, but also in the regimental field trains; in the transportation of siege artillery material and of the material of and ammunition for mountain artillery, and, finally, in replacing the company wagons.

This has been the field most extensively investigated, and this will probably be the main application of the automobile in war.

In Italy, in consequence of trials made by the engineers of the army, the War Department decided as early as 1897 to assign to the army a certain number of automobiles for the transportation of baggage. This nation was particularly anxious to adopt a carriage which economized the horses needed, because of the scarcity of these animals in the country.

In Russia the Grand Duke Vladimir has been studying the possibility of transporting the artillery by means of automobiles, reserving the horses for the cannoneers and for special movements or to assist at difficult points on the road. In this way the number of horses needed could be considerably reduced, and their condition, on arriving on the battlefield, immensely improved.

In Austria the Daimler automobile has been introduced into the army for the transport of heavy artillery material and particularly for the transportation of ammunition for the guns of the Steinfeld polygon near Wiener-Neustadt. The motor is a 10 horse-power benzine motor, giving the wagon a speed of from three to seven miles an hour with a load of 11,000 pounds on a slope of one in ten. A number of trials has been made near Vienna as well as in the mountains of Galicia, and the results have passed all expectation.

France has experimented with automobiles for heavy loads with the Scotte wagon for supplying the forts on the right bank of the Seine and with the Dietrich wagon in the Soudan.

Germany, from an appropriation of $25,000, has recently purchased seven automobiles for the transportation of commissary stores and ammunition. During the manœuvres of 1898 on the Weser such an automobile was tested and in those of 1899 two automobiles were used on the relay lines of supply.

Belgium is having one of its army wagons for the transportation of supplies transformed into an automobile. The new wagon weighs 4,400 pounds and its maximum speed is ten miles an hour. The constructors are now trying an 18-horse-power motor with direct transmission, American rubber tire with interior steel wire cables being adopted for the wheels. In the Belgian Congo the automobile has been introduced to replace the native porters and to substitute land transportation wherever the difficulties of navigation are too great for convenient water transportation. Capt. Carton, who has been authorized to introduce the automobile, proposes to organize three routes, one toward Redjaf, branching to the Ouellé, another from Stanleyville to the Lualaba and the Tanganika, and a third through the caoutchouc regions of Kassai and Lomami to the Lualaba. Rapids and cataracts on water routes are to be passed on land by means of automobiles.

Finally, automobiles will find special application in field hospitals, securing a more prompt first aid to the wounded, and will be useful in hunting up the wounded on the field. They will also make excellent carriages for rapid-fire and machine guns; they will serve to transport more quickly the field bakeries and kitchens, thus giving the troops more rest; and they can be used with plows for rapidly making trenches for the troops, again saving much hard labor, and at the same time transporting most of the intrenching tools.

In Germany a searchlight automobile has been experimented with. It is a four-wheeled vehicle, run by a five horse-power petroleum motor, which can be made ready in three minutes and run for fifteen hours without renewal of fuel. This motor works a searchlight, and also furnishes four electric arc lights (of 800 candle-power each) for a flying field hospital.

In England the automobile gun carriage has been most fully developed. The Maxim Company has just constructed a very light machine gun, weighing only twenty-six pounds, and this is mounted in pairs on a tandem tricycle, the whole weighing about 320 pounds.

The whole subject, therefore, although still in the experimental stage to a large extent, opens up a fine field of investigation, and many of the problems are nearing practical solution, indeed are already so far solved as to insure the use of automobiles in the next war.

Power from the Waves and Tides.

"Cassier's Magazine" for September will say: "With visions of exhausted coal supplies, even though the end be far off, come thoughts of power from sources other than coal, from wind and water, and from the restless ocean waves and tides.

"Of water power there are a goodly number of important installations, principally in the United States, where electric power distribution from them over comparatively long distances has reached a high state of development. In Great Britain, on the other hand, power from waterfalls is a scarce commodity and not much is to be hoped for in this direction, so that there is something of interest in a recent forecast of the country, with every hill or other point of vantage studded with huge wind-mills for generating electricity, to be subsequently distributed to manufacturing centers. Many years, however, would have to elapse before coal would become sufficiently dear to make such a scheme worth considering in a practical way. Wave motors and tide-power schemes have been almost endless in number. The former have, in a few instances, been used for light pumping work at seaside places, but such pumping outfits have been very far from demonstrating that the wave motor could ever be seriously considered as a prime mover where large powers were demanded; in fact, the wave motor is a little better than a toy. As to power from the tides there is little to be said, except that much money has been wasted in vain endeavors to turn it to practical account. The tide-power scheme probably always will be alluring and also disappointing. The disappointment comes from the fact that very few people seem to take the trouble to figure out how much water and how considerable a fall are required to give any useful amount of power. A horse power for a day of ten hours, for example, would require something like 120 tons of water falling from a height of 100 feet, so that a 500 hp. factory, say, would need 60,000 tons of water at a 100-foot head. On the basis of 36 cubic feet of water to the ton, there would thus be over 2,000,000 cubic feet of water, and this would make a fair-sized pond, say, about 1,000 feet long, 200 feet wide, and 10 feet deep. There is in these few figures something that may help to open the eyes of the tide-power plan inventor, and of those who are in the habit of putting money into such things."

GAS ENGINES AND THE ECONOMY OF GASOLINE ENGINES FOR SMALL POWER.*

BY JOHN WILKES.

The slight expense at which small-sized gasoline engines may be operated is so marked that it is somewhat surprising that they are not more widely used even than they are. This may be due to counterbalancing disadvantages or defects in the gasoline engine as a motor, or it may be due to the fact that the gasoline engine, being a comparatively new thing, has not yet been thoroughly introduced, so that its advantages are not as widely known as they might be.

Defects and disadvantages the gasoline engine certainly has, but in spite of them there are situations where it is decidedly the best kind of power to use. It is to bring up for discussion before the members of this association the subject of the advantages and disadvantages of this motive power that the present paper is written

The title has been written The Economy of Gasoline Engines for Small Power, because, in the writer's opinion, a very large gasoline engine is not economical, compared with other kinds of power except under unusual conditions. However, the gasoline engine's half-brother —viz., the gas engine—is, for cases requiring large power, a very promising applicant for future requirements, and later on in this paper a few words will be said as to that.

Gas and gasoline engines are of an entirely different type from steam engines. In this end-of-the-century day we have wireless telegraphy, horseless carriages, smokeless powder and the gas engine might be called a "boilerless engine." There is no boiler about it. The pressure furnishing the power is generated by

*Paper read before the Engineering Association of the South at Nashville, Tenn.

Digitized by Google

an explosion of gas in the cylinder of the engine.

The gasoline engine is an offshoot from the gas engine, or rather, more properly speaking, it is a gas engine, the gas being merely a particular kind—namely, the vapor of gasoline, so that in what follows of a general nature, wherever a "gas engine" is spoken of, it is to be understood that it is the same thing as a gasoline engine.

The idea of deriving power from the energy of an explosion by means of a motor is at least as old as Watt's invention of a means of turning the expansive force of steam to account.

Huyghens proposed in 1680 to make an engine in which the explosion of gun-powder in the cylinder of an engine would force the piston forward and so produce power. Something like this is what is done in a gas engine, so that in this sense the idea of the gas engine may be said to have antedated Watt's steam engine. However, it is hardly necessary to say that no practical working motor was made on this plan nor at this time. Passing over several interesting and more or less successful attempts at the problem, the first commercially successful internal combustion motor or gas engine was the Lenoir gas engine of 1860.

In this engine a mixture of gas and air was drawn into the cylinder for about half a stroke the valves closed, and the mixture ignited or exploded, producing thus for the last half of the stroke considerable pressure. This engine was double acting, like the ordinary steam engine—that is, it had the force applied on opposite sides of the pistons alternately. These engines were introduced commercially to some extent. They ran smoothly, quietly and satisfactorily but consumed rather a large amount of gas. As this was the first commercially successful gas engine, it will be seen that the steam engine had rather a long start of the gas engine, as Watt introduced the steam engine in 1769.

The next great step in advance was the introduction, in 1876, of the famous Otto gas engine; and as practically all engines built since operate on the same plan, a brief description of the Otto cycle, as it is usually termed—though, strictly speaking, Beau de Rochas first proposed it—will be given. The engine is usually single-acting, or, in other words, receives the pressure of the explosion only on the back of the piston, the front of the cylinder being open. The series of operations is as follows: The piston being at the back end of the cylinder and just ready to start forward, the inlet valve opens and a mixture of gas and air is drawn in as the piston moves forward. When the piston has reached the limit of its forward movement, the cylinder is full of the mixture of gas and air. All of the valves then close, and the piston on its return stroke compresses the mixture of gas and air. As the piston again starts forward the compressed gas and air are exploded or ignited by a spark, and the pressure thus produced is the source of the power of the engine. On the next stroke the products of combustion are expelled from the cylinder through the exhaust valve. The same cycle of operations is then repeated indefinitely. It thus appears that only one stroke in four is effective, and during the rest of the time the motion of the fly wheel is all that keeps the engine going. Very heavy fly wheels are thus a necessity. The Otto patent expired in this country in 1890, since which time numerous factories for the manufacture of gas and gasoline engines have sprung up all over the country.

With this brief sketch of the gas and gasoline engine, we will now consider the design, construction and operation of the engines commercially before the public in this country. The above described Otto cycle, which has been found by experience to be the most economical and best of any so far proposed, is used in nearly all engines made, and the differences in the engines are differences in the organs provided to carry out these functions, so to speak. In common, they all have large, heavy fly wheels, trunk pistons, single-acting cylinders, water jackets, and poppet valves. The points of difference are the method of making the mixture of the air and gas, or the measuring of the gasoline mechanism for operating the various valves, method of ignition, style of cylinder (vertical or horizontal), etc.

As between vertical and horizontal cylinders, it might be said that the arguments for one or the other are pretty much the same as in the case of the steam engine. Vertical cylinders require less floor space, have less drag and wear by the piston on the bottom side of the cylinder, and apparently adapt themselves more readily to multicylinder construction. There seems to be a tendency toward this as a type of American construction. However, many good makes of American engines—in fact, probably the majority—employ the horizontal cylinder.

The valves of gasoline engines are now nearly always made of the poppet type. The mechanism for operating them is of the most varied kind—spiral gears, bevel gears, eccentrics, push rods, spur gears, bell-crank levers, etc. The writer's preference is for a side shaft driven by spiral gears and operating everything—governor, inlet valve, exhaust valve, sparker, etc. This seems to be the simplest and neatest construction.

Mixing chamber and inlet valve are sometimes cast integral with the cylinder, sometimes bolted on. They often present a cumbersome, awkward appearance, are in the way if the engine is to be moved about, and are so placed that they offer great temptation to the men moving the engine to take hold of them in lifting the engine, with the result that they are broken off. The same is true as to many of the other parts of the engine, which are often made too small and delicate, stand out too far from the body of the engine, and are admirably adapted to take the weight of the whole engine—until they break off.

Gasoline may be fed by a pump feed or gravity feed. For very small engines the latter is preferable as being simpler. On large engines the pump feed is safer as regards fire, as the gasoline tank may then be outside the building, and there is no danger of the gasoline flooding.

Ignition is produced usually either by a hot tube or an electric spark; the former is the favorite method in England, and the latter usually in this country. If an electric spark is used, it may be produced by a battery, such as the Edison-Lalande, and a spark coil, or by a small dynamo made for the purpose and driven by the engine itself. The difficulty about the latter is that when the engine is not running the dynamo is "dead," so there is the difficulty of starting, and if a battery must be used then, it is less bother to have a battery that can be used all the time. Besides this, if the engine has work to do in which the load is thrown on and off suddenly, and the load is nearly or quite up to the capacity of the engine, there is a momentary slowing up of the speed of the engine when the load is thrown on, and this causes a diminution of the speed of the dynamo so that it will not furnish current enough to make a spark; the result is that the engine misses an explosion, causing further loss of speed, which decreases the current from the dynamo and so on until the engine stops. If electric ignition is used, it is best to have the sparking points or electrodes of platinum, or rather an alloy of platinum and iridium. The arrangement of the means for bringing the points together and separating them is important. The points should come squarely together without chance of missing, and the adjustment of them so that they will do so should not be long, tedious and difficult. The electrodes should be simple and the platinum points easily applied and also (as the scrap is very valuable) easily removed. If the design is such that platinum wire can be used to make the points, it would seem to be an advantage, as a short piece of the wire could be kept on hand and enough to make a point cut off as needed from time to time.

Batteries for portable engines are apt to be troublesome. There is a style of Edison-Lalande now made which has liquid-tight steel enameled jars, with rubber rings to seal them: these may be better for portable batteries than the ordinary style with porcelain jars. In general, simplicity, compactness, neatness of design, durability and fewness of parts should be aimed at by the designer of an engine that is to be handled by the class of mechanics that the gasoline engine usually falls into the hands of.

That for the practical needs of some people, whatever may be the case as to the general market, the gasoline engine might be simplified, is shown by the experience of the mines where the writer is employed. A small gasoline engine used for running a pump for pumping in the mines, having had some of the small, delicate parts constituting the gasoline injector broken, the whole injector, with governor, mixing valve, etc., was taken off and sent to the machine shop for repairs. The exigencies of the case requiring it, as the water was about to get beyond control, the engine was run all the same; and since then, the injector proving difficult to keep in proper adjustment on account of wear, etc., it has been cast aside, and we have the spectacle of the engine running—and running satisfactorily, too—with all these parts gone. The governor to the engine as it now runs is the work it has to do, and, in case of accident, the boy who runs the engine.

In the operation of gasoline engines there are several points at which they differ from steam engines. In the first place, they are not like steam engines, in which all that has to be done to start is to open the valve.

Gasoline engines have to be started. The wheels have to be turned by hand until the engine makes the first explosion, which, if the engine is all right and perfect, will be the first time it is turned over. Generally, though, everything will not be all right and perfect, and sometimes a good many turns are required, which soon gets to be very tiresome. Self-starters are usually furnished with the larger size engines (above 15 or 20 horse power); but with our 30 horse power engine we have never used it, starting always by hand. Gasoline engines run better after they get warmed up.

Gasoline engines, owing to the intense heat

Digitized by Google

generated in the cylinder by the explosion, require a higher grade of cylinder oil than do steam engines. Batteries require renewing every two to seven months.

Repairs on gasoline engines used inside mines and where the grade of mechanical skill of those in charge of them is that of ordinary laborers, are likely to be disappointing to one who reads the testimonial books sent out by various makers and expects similar results in his own case.

One advantage of gasoline engines is that they require so small an amount of water, only a little for cooling the cylinder, which may be used over and over again. So that they may be said to require practically no water supply. Our 30 horse power engine uses about 300 gallons per day, whereas a steam engine of the same power would require 3,000 gallons. This has led to their use, even in pretty large units, in the arid regions of the West—Arizona, New Mexico, Colorado, etc. One 40 horse power engine there uses less than 40 gallons of water per day, according to a published report.

It may as well be acknowledged, in closing this division of the subject, that in operation gasoline engines are balky. Sometimes they will run, sometimes they won't; that's all there is to be said about it. What you do doesn't matter. When it gets in the humor to run, it will run; but neither you nor anyone else can tell what you did to make it go.

In testing small gasoline engines to ascertain what brake horse power they were developing, I have used the rope brake and spring balances. This is a cheap, simple, easily applied kind of brake, from which there is no danger of overheating the rim of the wheel to which it is applied and requiring no lubrication. The outfit for testing an engine up to, say, 10 horse power does not cost over two or three dollars. Indicating gas engines is said to be rather unsatisfactory and difficult. I have never tried to indicate one.

Small gasoline engines, once they are started, require practically no attention. It is to this principally that the economy referred to in the title is due.

The cost of the gasoline at present market prices for any size below 10 or 15 horse power is less than the cost of attendance alone for a steam engine and boiler; so that, even with coal absolutely free, one could not afford to use a steam engine and boiler of small size in an isolated location. There are many such cases where less than 15 horse power is needed at a location isolated from any large boiler plant. Of course if the power is needed at some point closely adjacent to a large boiler plant, where the only thing necessary is to put in the steam engine and connect to a steam pipe, the steam engine would probably be the cheapest; but if a fireman has to be employed to fire the boiler to make steam for a small, isolated steam engine, even though the fireman can be engineer as well as fireman, then the gasoline engine is cheaper for the total than the steam engine is for attendance only, to say nothing of fuel.

To show how cheap a gasoline engine may sometimes be, I may mention an engine of 7½ horse power which works under a varying load, the expense of running which is: For gasoline, 65 cents per day; attendance, 10 cents; total, 75 cents per day. A steam engine for the same work would cost: Attendance, $1.75; water supply, 10 cents: fuel (half ton of coal, say), $1.50; total, $3.35 per day.

Recently considerable interesting work has been done in the line of large gas engines using either natural gas or producer gas. A number of large engines are run on natural gas in Pennsylvania, Ohio and Indiana, and other States in the natural gas belt. With a good gas engine and cheap natural gas to use in it, the power consumer has something almost as good as a free water power, and something cheaper than the electrical energy as sold by the water power development companies, such as those at Niagara Falls.

Natural gas, however, is not at everybody's door, and the more general question of gas engines run by special gas made for the purpose is therefore of interest to a larger number of people. There are three different lines in this direction along which workers are experimenting—viz.: gas engines run on producer gas, gas engines run on blast furnace gas, gas engines run on the gas from by-product coke ovens.

The first (producer gas) has been successfully exploited in England by Dowson, and in France by Lencanchez, and also in this country, the plant at Danbury, Conn., and the recently installed plant of the Erie Railway at Jersey City, N. J.

So far, however, it has only been from anthracite coal that this producer gas for gas engine purposes has been successfully made, in this country at least.

There is no apparent reason why gas from the Semet-Solvay and other by-product coke ovens should not be suitable for use in gas engines and furnish very cheap power. The blast furnace being incidentally a huge gas producer, the idea of using the surplus gas from it in gas engines has occurred to several people.

The most described plant of this kind is the one at Seraing, Belgium, though there are several others in England and elsewhere. There is now in operation at Seraing a 200 horse power gas engine run on blast furnace gas, and the results are said to be satisfactory and very economical. Very large engines are now being built in Germany and France for this purpose, some as large as 500, and even 1,000 horse power.

The thermal efficiency of gas engines is much higher than that of steam engines, and the efficiency as measured in pounds of coal used, which is what a practical man is interested in, is also better, being for gas engines equal to about one pound of coal per horse power per hour; while it is a very good steam engine that comes under two pounds per horse power per hour, and ordinary engines run from four to eight or ten, even sometimes higher.

Now if gas engines are so much superior to steam engines in economy, why are they not rapidly taking the place of steam engines? The answer is that it is principally because the gas engine is hard to start, balky, of large dimensions in comparison with the power developed, and a new thing. Until very recently they were not made in large sizes, rarely over a 100 horse power. This is, as stated above, not now the case. I think we may look to see the gas engine assume a very prominent place in the future, and perhaps it will not be a very distant future, either.

THE RENO INCLINED ELEVATOR.

A new attraction has been added at the Crystal Palace, says the London "Electrician," in the form of an "inclined elevator." This, the directors of the Crystal Palace hope, will entice a greater number of people to the gallery of their large building, for it appears that the exhibition of pictures there is much neglected by the public. Elevators of this type have been in operation some years in the United States, but the "Reno" elevator exhibited at the Crystal Palace is different in some respects from the latter.

The elevator consists of a moving floor and a hand-rail moving at the same speed, inclined at an angle of 25 deg. with the horizontal. It is carried on a steel framework bolted at the top to the girders supporting the gallery, and secured in a similar manner below. The moving floor is formed of a series of transverse slats or treads attached to an endless chain which passes over a sprocket wheel at each end. These slats are 3 feet 6 inches in length (i.e., in the direction perpendicular to the chain) and are only a few inches in width, corresponding of course to the length of a link of the chain. They have fastened to them a series of rubber covered longitudinal ridges, each being ⅜ inches wide and 1 inch high, to serve as a comfortable footing for the passengers. Beneath each wooden slat are attached, one at each end, small wheels made of a material termed "Hemacite" which appears to be a compound having rubber and several other substances in its composition. These rollers travel upon angle-iron tracks both on their upward and downward paths, and ensure easy and noiseless running.

FIG. 1.—RENO INCLINED ELEVATOR AT THE PARIS EXHIBITION.

The upper sprocket wheel is driven through a belt and spur gearing by 9 hp. electric motor of American manufacture, supported on the same framework as the elevator. The speed of the motor is 650 revolutions per minute, which is reduced to 14 revolutions per minute for the sprocket wheel, and the inclined floor moves at about 90 feet per minute.

At the top end of the incline is a cast-iron plate which serves as a landing stage; and forming part of this is a sort of comb the prongs

Digitized by Google

of which are curved to follow closely the contour of the chain of slats as it arrives on the sprocket wheel. These prongs are so proportioned that they fit in exactly between the longitudinal ridges on the slats already mentioned, and in this way the feet of the passengers are moved off smoothly on to the landing stage. So perfect is this action that a handkerchief or paper dropped on the incline is not carried round beyond the top but remains on this comb until it is picked up.

In order to prevent the machine from running back if it stops while passengers are on it, for instance, by the motor fuse blowing—a ratchet wheel and pawl are fitted to the lower sprocket wheel, and another simple pawl rests on the under part of the chain at its center.

The moving hand-rail is formed of an endless steel chain, covered with a flexible rubber covering, passing over sprocket wheels much in the same way as the inclined track itself, and moving with the same peripheral velocity. In this case, however, it is necessary to provide against the chain being pulled out of its course too much by the passengers, and this is done by the use of links, the under side of which have little cross pieces which slide in grooves cut in the fixed bannister which this moving hand-rail covers. At the upper end the moving rail passes down over its sprocket wheel, and thus the passenger is obliged to release it.

Five of the inclined elevators at the Paris Exhibition are also of the "Reno" construction, and one of these is illustrated in Fig. 1. Fig 2 shows the general arrangement of the elevator at the Crystal Palace.

The following are the makers' estimates of the horse-power required for working an inclined elevator 19 feet high:

1.2 hp.	Elevator free.					
2.36 "	"	carrying up	600	passengers	per hour.	
2.8 "	"	"	" 1,200	"	"	
2.95 "	"	"	" 1,500	"	"	
5.15 "	"	"	" 2,250	"	"	

An interesting modification of this elevator is one especially suitable for docks, etc., in which goods have to be transported from one level to another, the difference in level being not, however, a fixed quantity. One end only can therefore be fixed, and the apparatus consists of a trussed steel framework which carries an endless traveling platform. This passes around suitable wheels at each end, those at the upper end being driven by an electric motor. The machine is mounted on swiveled wheels, and can be moved easily to any position on the dock or in the warehouse; being on a self-adjusting base, it can then be raised to the required position by pulley and tackle. Such an elevator, 38 feet in length, weighs about 45 cwt. This appliance should prove even more useful than the fixed pattern.

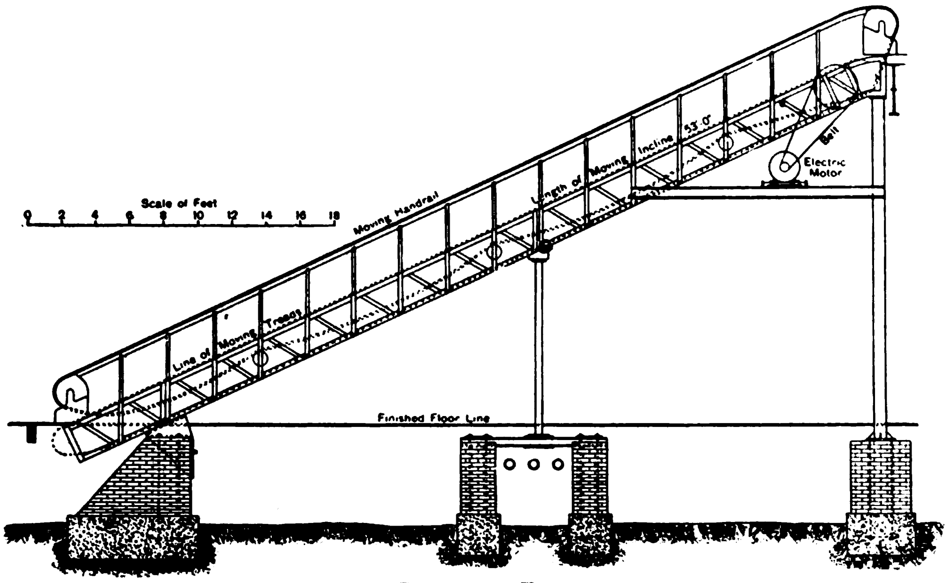

FIG. 2.—ELEVATION OF THE RENO INCLINED ELEVATOR AT THE CRYSTAL PALACE.

LONDON NOTES.

[From our London Correspondent.]

The British Association Convention.

On Wednesday, September 5, the annual convention of the British Association for the Advancement of Science opens in the city of Bradford. The president for the year is Prof. Sir William Turner, who occupies the anatomical chair of Edinburgh University. The text of his address, which will be delivered to the entire assembly on the evening of the opening day, will be "Progress in Biological Science." The following morning as usual the proceedings will be divided up into sections. Section A, in which papers on Mathematical and Physical Science are considered, will be under the presidency of Dr. Joseph Larmor, F. R. S. Nothing has yet been officially published as to the exact character of the various contributions, but in unofficial publications it is stated that Dr. Larmor in his address will give a review of the change of ideas which has recently become current regarding the scope and method of physical explanation. In a forecast it is stated that "the acceptance on the Continent, in consequence of the brilliant work of Hertz, of the views originated in England regarding the nature of electric actions and their dependence on the ether has been largely accompanied by an elimination of the dynamical explanations which formed a main feature of Clerk-Maxwell's theory. This makes it a matter of fundamental importance to determine, if possible, how far purely descriptive methods can avail without appeal to a dynamical foundation; it involves consideration of the mode of representation of the physical activities of the material atoms, and it raises the question whether denial of direct action at a distance necessarily implies transmission by simple stress such as occurs in a material elastic frame." Among other proceedings in Section A there has been a discussion arranged on Ions. This will be introduced by Prof. Fitzgerald.

The address to the Chemistry Section, B, will be delivered by Prof. H. W. Perkins, and will deal with "The Modern System of Teaching Practical Inorganic Chemistry and its Development."

The Economic Science and Statistics Section will have a few matters of electrical interest before it. "Municipal Trading," which has commanded such widespread attention during the past few months in view of the proceedings of the Parliamentary Committee (which, by the way, has had to close its proceedings without completing its investigations or preparing a report because of the prorogation of Parliament), will be brought up by Mr. Arthur Priestman.

The only other section of importance, from the writer's point of view, is the Mechanical Science Section, G; in fact this is the section in which practical electrical engineering papers and discussions occur. Mr. J. B. C. Kershaw will contribute on "The Comparative Cost of Power Generation by the Steam Engine, Water Power and Gas Engines." This paper will presumably be an amplification of the paper introduced and circulated in some quarters—but not read—on the occasion of last year's convention at Dover. Some engineering journals published the first part of the paper last year under the impression that it had been accepted and read. This year the topic will of course be very opportunely brought forward in view of the increased attention which has lately been devoted to the question of generating and distributing electrical energy on a large scale in certain English districts.

Mr. Alfred H. Gibbings, the late Corporation electrical engineer of Bradford, will deal with "The Design and Location of an Electric Generating Station." A new form of self-registering electric rain-gauge will be described by Mr. J. W. Binnie. The advantages of automobiles for electric street traction, also a topic of considerable discussion here lately, will be discussed by Mr. J. G. W. Aldridge.

Sir William H. Preece, who recently championed the cause of the high speed electric railway scheme for Manchester and Liverpool before a Parliamentary Committee, will describe the system, and in view of the regret which is felt at the dismissal of the proposal, an interesting discussion may be looked for.

"Steam Raising and Smokeless Combustion" is to be brought up by Mr. Armitage, and Prof. Goodman will give an account of a new form of calorimeter for measuring the wetness of steam.

Prof. Hele Shaw, who is professor of engineering at Liverpool University College, will speak on "Resistance on Roads" when tramway and railway papers come forward, and Mr. Dawson, the deputy surveyor of Bradford, will describe recent tramway construction with special reference to the Demerbe rail which has been adopted at Bradford for the electric trolley lines.

"The Resistance and Acceleration of Trains—Measurement of Tractive Force," is the title of a paper by Mr. A. Mallock, in which will be given an account of the author's recent experiments on electric and other railways to determine the acceleration, tractive force and the running resistance to which trains are subjected.

Other matters to come before the Mechanical Science Section, of which Sir Alexander Binnie is president, include the description of a new maximum demand meter invented by Mr. Barker and Prof. Ewing.

These announcements lead one to anticipate something better from the 1900 proceedings

Digitized by Google

than from those "gigantic picnics" of the last year or two.

CONCERNING HOT WIRE INSTRUMENTS.

To the Editor of Electricity.

Sir: I note in your issue of August 1st an article on Electrical Measuring Instruments, by J. Franklin Stevens, this article having been delivered before the Franklin Institute of Philadelphia.

I wish to call attention to some of Mr. Stevens' remarks concerning hot wire instruments, which I think need some modification. I quote Mr. Stevens' article in full as follows:

"As a shunt ammeter the hot wire instrument is a distinct failure, for, while the manufacturers claim it can be operated on .3 volt drop for full scale, my personal experience has shown a drop of 6 volts to be necessary." I do not know how much experience Mr. Stevens has had, evidently not as much as some other people, for hot wire ammeters with shunts have been, and are being made every day that require even less than .3 volt drop for full scale deflection. The Stanley Electric Manufacturing Company are making hot wire shunt ammeters from 100 ampere to 6,000 ampere capacity with an average drop of .26 volt for full deflection. We are prepared to furnish any one wishing to purchase hot wire shunt ammeters, from 100 ampere maximum to 6,000 ampere maximum capacity, a guaranteed fall of potential not exceeding .3 volt.

Again to quote Mr. Stevens: "It has been shown that these ammeters (hot wire) when calibrated on direct current are not accurate within 10 per cent. when used on alternating currents unless the reactance in the shunt is exactly equal to the reactance in the instrument." Here Mr. Stevens claims that the least possible error that the instrument can have from this cause is 10 per cent. Such a statement is manifestly absurd.

In themselves the reactance of the shunt and the reactance of the instrument introduce no error. An error is introduced only when the ratio of the reactance voltage of the shunt to its ohmic drop is different than the ratio of the reactance voltage of the instrument and its ohmic drop.

In the April issue of the "American Electrician," Mr. E. A. Wagner called attention to the fact that if the reactance voltage of the shunt was 50 per cent. of its resistance drop, and the instrument had no self-induction, then the instrument might be in error to the extent of 10 per cent. I suppose it is from this article that Mr. Stevens drew his inspiration. Mr. Wagner has since explained that he merely wished to call attention to the fact that such an instrument could be made. Of this there is no doubt, if any one wanted it. In practice, such a condition is impossible, as both shunt and instrument are a part of the same circuit, and as such have their proportionate share of the reactance.

If the instrument and shunt are carefully designed, so that the ratios of reactance and resistance approximate each other, the error introduced becomes exceedingly small. In fact in over 1,000 instruments calibrated on direct current, and checked on alternating current, I have never found an instrument in error when the standard shunts and leads have been used.

W. J. Lloyd.

Pittsfield, Mass., Aug. 21, 1900.

TENTH ANNUAL MEETING.

The American Electro-Therapeutic Association to Assemble in New York.

Members of the medical and electrical profession are taking great interest in the tenth annnual meeting of the American Electro-Therapeutic Association, to be held at the Academy of Medicine, 17 West 43d street, New York City, September 25 to 27 inclusive. Dr. Walter H. White, of Boston, is president, and Dr. George E. Bill, of Harrisburg, Pa., is secretary of the association. Dr. Robert Newman, of 148 West 73d street, New York City, is chairman of the committee on arrangements, and can furnish information regarding the meeting. The headquarters of the association during the meeting will be the Hotel Bristol, at the corner of Fifth avenue and 42d street. The following is the general programme for the meeting:

First day, Tuesday, September 25—9 a.m., executive session: 10 a.m., general meeting and three papers; 2 p.m., visit, by invitation of President H. Sanderson, to New York Electric Vehicle Transportation Co., 1684 Broadway; 3 p.m., visit, by invitation of New York Telephone Co., to central station; 4 p.m., afternoon session at Academy of Medicine, 17 W. 43d street: discussion of Tuberculosis and three papers; 8 p.m., evening session, six papers.

Second day, Wednesday, September 26—9 a.m., executive session; scientific session, discussion on gynecology and four papers: 2 p.m., visit to Metropolitan power house, 96th street and 1st avenue; 3 p.m., Brooklyn Bridge, inspecting the machinery of the cable cars; visit to a down-town station of the Telephone Co.; 4 p.m., afternoon session, seven papers; 8 p.m., executive session, private, election of officers; 9 p.m., lecture by Mr. C. T. Child.

Third day, Thursday, September 27—10 a.m., morning session, 10 papers; 2 p.m., Riverside Drive, Grant's Tomb; visits, by invitation, to Columbia College, to library and laboratories, St. Luke's Hospital, Amsterdam avenue and 113th street, inspection of the Episcopal Cathedral.

The American Institute of Electrical Engineers in England.

(From the London Electrical Review, August 17, 1900.)

On Sunday, August 12, about 55 members and guests (including many ladies) belonging to the British and American societies left Paddington at 10:05 a.m. for Henley, where electric launches were in waiting. In these the party was taken nearly to Shiplake, returning to Henley for lunch at the Red Lion. Earl Russell and Mr. C. H. Stearn joined the excursionists at Henley with their steam launches, and took some members of the party aboard.

At lunch, Prof. Perry, who presided, proposed the toasts of "The Queen," and "The President of the U. S. A."; the toast of "Our Guests" was jointly proposed by Mr. Siemens and Mr. Mark Robinson, and responded to by Mr. Carl Hering and Mr. W. J. Hammer. This dual system of proposers in series was, as announced from the chair, worked out by the President (Prof. Perry), and was tried for the first time at this lunch. It is, therefore, presumably the subject of provisional protection. We might suggest as an improvement that the toast having been duly moved and seconded, the motion be put to the vote!

After lunch, the launches and lunchers proceeded to Maidenhead, partook of tea at the Thames Hotel, and returned by special saloon cars to Paddington. Thanks to the fine weather, the trip was in every way most enjoyable. On Monday morning the Electrical Standards Laboratory of the Board of Trade was visited, the party being received by Mr. Trotter, Mr. Renne and Mr. Crawley; as an alternative, some of the visitors were shown over the G.P.O. Telegraph Department by Mr. Gavey.

In the afternoon a visit was paid to the Central London Railway generating station and to the sub-station at Marble Arch, under the guidance of Mr. Cunningham and Mr. T. Stevens. Afterwards, proceeding by way of Bond Street station, which was specially opened for the occasion, the party went to the Davies Street station of the Wesminster Electric Supply Corporation. In the evening a dinner was given in honor of the American visitors.

On Tuesday an excursion was made to Chatham Dockyard, where the party was received by the Admiral Superintendent (Admiral Holland), and shown over the workshops and the first-class battleships Albemarle and Irresistible by the civil engineer. Next the visitors were taken over the electrical section of the School of Military Engineering by Major Carr, R.E., and were afterwards entertained at lunch by General Sir Thomas Fraser at the R.E. mess. Later on they attended a garden party at Lady Fraser's.

On Wednesday the British and American electrical engineers proceeded to the Paris Congress.

Among the principal American guests present at the various functions, were: Mr. Carl Hering (President Amer. I.E.E.), Dr. A. E. Kennelly, and Prof. Crocker (past President, Amer. I.E.E.), Mr. E. O. Mailloux, Mr. W. J. Hammer, Mr. R.W. Pope (Secretary, Amer. I.E.E.), and Messrs. H. Ward Leonard, H. D. McVay, J. G. White, W. C. Burton, D. Adamson, E. H. Mullin, L. A. Phillips, W. D. Brown, J. R. Edwards, B. J. Arnold, I. W. Henry, E. G. Bernard, R. O. Heinrich, W. J. Clarke and R. W. Lohmann.

Meeting of the International Association of Municipal Electricians.

The Fifth Annual Meeting of the International Association of Municipal Electricians will be held in Pittsburg, Pa., September 25, 26 and 27, 1900. Papers on the following subjects will be read and discussed:

"Benefits to be Derived from Our Association," by Capt. Wm. Brophy, Chief Electrician Wire department, Boston, Mass.

"Contact Points," by Frank C. Mason, Superintendent of Police Telegraph, Brooklyn, N. Y.

"Trials and Troubles of Instituting and Enforcing Municipal Inspection and Control," by M. G. Canfield, Superintendent Fire Alarm Telegraph, Grand Rapids, Mich.

"Automatic Fire Alarm Systems," by Charles Burger, manager of the Boston Thermostatic and Automatic Fire Alarm Company, Boston, Mass.

"Advantages and Disadvantages of Carrying High and Low Potential Conductors upon the Same Poles." This subject will be presented by an able electrician for general discussion.

The headquarters will be at Monongahela House, where all sessions of the Association will be held in the Banquet Hall; this hotel has been the headquarters for conventions for the past fifty years.

All delegates and visitors will be accommodated there at $3 and $4 per day, American

Digitized by Google

plan; those who desire European plan can be accommodated at the Griswold Hotel for $1 per day and upwards; at Newell's Hotel, Henry Hotel, Lincoln Hotel, Duquesne Hotel, Schenley Hotel for $2 per day and upwards; also at the Seventh Avenue Hotel and Anderson Hotel, American plan, $3 per day and upwards.

There will be two sessions daily, at 9.30 A. M. and 2.30 P. M., respectively.

During the evening of the 25th, there will be a trolley ride on special cars over the Consolidated Traction, United Traction and the Monongahela Street Railway Company's lines, which cover many miles of the most beautiful and picturesque scenery in this country.

During the afternoon of the 26th, there will be carriage rides over the boulevards and through the parks for the ladies, and in the evening theater parties and inspection of some of the large iron and steel mills by those who desire to see them.

The afternoon and evening of the 27th, there will be an excursion on the steamer Mayflower down the Ohio River to Davis Island Dam, seven miles and return, then up the Monongahela River forty-five miles and return, during which there will be a banquet served and during the entire trip the guests will be entertained by the Tariff Club Quintet, C. F. Harris, manager, and a musical programme arranged and directed by Professor H. P. Ecker, city organist of Allegheny, Pa. On this trip all will have a good view of many of the largest manufacturing plants of the world-famous city of Pittsburg.

So far as possible arrangements will be made for members who desire to inspect the works of the Westinghouse Electric & Manufacturing Company, at East Pittsburg, the Westinghouse Air Brake Company, at Wilmerding, and the Standard Underground Cable Company, of Pittsburg.

LEGAL NOTES.

The Supreme Court of Washington has rendered a decision favorable to the Seattle Electric Company in its franchise case, reversing the decision of the lower court. This gives the company a complete railroad franchise for 35 years on all its present lines as well as on several new ones.

Application has been made to Circuit Judge Hazel to have the Clyde Gas & Electric Company of Clyde, N. Y., declared an involuntary bankrupt. Argument on the application will be heard at Buffalo on September 4. The corporation went into voluntary dissolution April 7 last. The nominal assets are $71,344.82, the actual, $40,000; liabilities, $50,279.21. The corporation was formed by merging the Clyde Gas with the Clyde Electric Company, then an Acetylene Gas plant installed, and steam heating and electric power taken. Money ran short, and Clyde was left without light or heat.

The Buffalo (N. Y.) General Electric Company has recovered a municipal court judgment of $72.04 against William McCarthy. The company alleged that it had delivered to McCarthy a "quantity of electrical currents," commonly known as electricity, for which he did not pay.

Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended August 22:

Antwerp, 29 packages, $2,557; 6 cases, $374; Argentine Republic, 159 packages, $6,671; Barcelona, 4 cases motors, $180; Brazil, 1 case, $41; 142 packages, $6,747; Bremen, 2 packages, $780; British East Indies, 1 case, $72; 3 cases motors, $800; British Guiana, 16 packages, $268; British Possessions in Africa, 195 cases, $22,030; British West Indies, 44 packages, $1,249; Central America, 14 packages, $233; China, 48 packages, $864; Chili, 6 cases, $91; Cuba, 18 cases, $1,439; Dutch West Indies, 5 cases, $66; Genoa, 8 cases, $694; Hamburg, 23 packages, $4,891; Havre, 198 cases, $16,177; Hayti, 1 package, $50; Japan, 216 packages, $10,760; 39 boxes motors, $8,953; Liverpool, 63 cases, $6,693; London, 86 cases, $3,113; 43 packages, $3,733; Marseilles, 17 cases, $2,008; Mexico, 14 packages, $1,039; 1 case motor cars, $200; New Zealand, 25 cases, $1,203; Peru, 11 packages, $364; Philippines, 80 cases, $1,608; 7 cases motors, $583; Preston, 17 cases, $750; Siam, 10 packages, $490; Southampton, 31 packages, $2,320; 1 case, $10; Uruguay, 2 cases, $200; Venezuela, 6 packages, $23; 2 cases motors, $45.

PERSONAL MENTION.

Mr. John M. Pendleton, one of the founders of the New York Electrical Society, died at his residence in New Brighton, N. Y., recently.

Mr. Arthur B. Shepard, who is manager of the General Electric Company for the Northern Ohio and Indiana district with an office in Cleveland, recently returned to his duties after a sojourn in Saratoga.

Mr. Charles H. Frisbie, of Jackson, Mich., prominently connected with the Kalamazoo Valley Electrical Company and electric railway interests, lately had a narrow escape from asphyxiation.

Mr. Thomas McLean, manager of the Toledo Traction Company, was recently presented with a silver loving cup by the Ohio Electrical Light Association in acknowledgement of the members' appreciation for the entertainment in which Mr. McLean had taken such an interest to provide for them while in Toledo.

INCORPORATIONS.

The New Kensington Electric Light, Heat & Power Company, New Kensington, Pa. Capital stock, $75,000.

The General Electric Storage Battery Company, New York City. Capital stock, $125,000. Thomas J. Ryan is interested.

The Aluminum Storage Battery Company, Chicago, Ill.—to manufacture storage batteries. Capital stock, $2,500. Incorporators: M. H. Casler, W. P. Johnson and C. K. Chamberlain.

The Bellefonte Electric Company, Bellefonte, Pa.—to manufacture light, heat and power. Capital stock, $5,000. Incorporators: J. C. Miller, E. L. Hoy, C. W. Boyer, E. L. Orvis and S. D. Gettig, all of Bellefonte.

The Citizens' Electric Light & Power Company, Sandusky, O. Capital stock, $100,000. Incorporators: John Sherwin, J. B. Hanna, H. A. Everett, B. Mahler, W. H. Price, George A. Stanley, James Hoge, C. H. Stewart and Charles W. Wasson.

ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U. S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

LETTERS PATENT ISSUED AUGUST 21, 1900.

ELECTRIC RAILWAYS AND APPLIANCES.

656,207. Trolley-Wheel Henry A. Osborne, Plainville, Conn. Filed Dec. 6, 1899.

656,276. Electric-Railway System. Louis E. Walkins, Springfield, Mass. Filed Dec. 15, 1898.

656,511. Electric-Railway System George L. Campbell, New York City, assignor to the International Electric Traction Company, same place. Filed Dec. 15, 1899.

ELECTRIC LIGHTS AND APPLIANCES.

656,211. Electric-Lamp-Supporting Bracket for Desks. Stanley S. Porter, Melrose, Mass. Filed Jan. 25, 1900.

656,431. Cord-Adjuster for Electric Lights. Frank H. Stewart, Camden, N. J. Filed May 9, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

656,165. Electric Generating Apparatus. John H. Bickford, Salem, Mass. Filed Dec. 8, 1899.

656,282. Circuit-Breaker. George S. W. Brubaker and William S. Twining, Philadelphia, Pa. Filed Nov. 20, 1899.

656,284. System of Non-Interchangeable Contact Parts. Moriz Froschl, Vienna, Austria-Hungary, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill., Filed Sept. 2, 1899.

656,291. Switch. Ernst W. G. C. Hoffmann, Charlottenburg, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Sept. 2, 1899.

656,451. Automatic Circuit Interrupter. Lionel Fleischmann, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed July 12, 1899.

656,455. Summation-Meter. Jesse Harris, Lynn, Mass., assignor to the General Electric Company of New York. Filed July 17, 1899.

656,473. Electric Controller. Charles J. Reed, Philadelphia, Pa. Filed Jan. 13, 1899.

656,522. Apparatus for Converting Alternating Currents into Continuous Currents. Max Deri, Vienna, Austria-Hungary. Filed July 6, 1899.

656,545. Electricity-Meter. George Hookham, Birmingham, England. Filed July 9, 1900.

656,571. Controller for Electric Motors. Thomas S. Perkins, Idlewood, Pa., assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed Jan. 13, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

656,333. Telephone-Switchboard Apparatus. Thomas C. Wales, Jr., Newton, Mass., assignor to the American Bell Telephone Company, Boston, Mass. Filed Nov. 7, 1899.

656,336-656,384. Switchboard for Telephones. Milton I. Baird, Glenfield, Pa. Filed March 1, 1900, Dec. 1, 1899.

MISCELLANEOUS.

656,158. Confiner of Wires for Electrical Connections. Charles F. Ash, New York City. Filed Dec. 11, 1899.

656,177. Commutator. John T. H. Dempster, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed June 8, 1900.

656,192. Manufacture of Pipes or Conduits for Electrical Conductors. Albert H. Howard, London, England. Filed May 18, 1900.

656,266. System of Electrical Distribution. Harry F. Roach, St. Louis, Mo. Filed July 10, 1899.

656,292. Electrically-Operated Submarine Torpedo. Peter C. F. Hoffmann, Kiel, Germany. Filed April 30, 1898.

656,305. Process of Electrolytically Extracting Zinc from Ores. Wilhelm Strzoda, Falenze, Germany. Filed Jan. 20, 1899.

656,309. Electric Burglar-Alarm. Paul V. Vandevelde, New York City. Filed Feb. 16, 1900.

656,323. Electric Bicycle. Albert Hansel, Zeits, Germany. Filed Feb. 1, 1899.

656,324. Controlling Electrical Currents. Arthur B. Holmes, Liverpool, England. Filed April 11, 1899.

656,372. Guard for Controller-Brushes. Andrew L. Riker, New York City. Filed Jan. 8, 1900.

656,421. Brush-Holder Ring. Henry G. Reist, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Aug. 5, 1898.

656,484. Combined Visible and Audible Signal. Eugene W. Vogel, Chicago, Ill., assignor to David S. Wegg, same place. Filed July 7, 1899.

656,454. System of Non-Interchangeable Electrical Contact Parts. Moriz Froschl, Vienna, Austria-Hungary, and Rudolf Hundhausen, Wilmersdorf, Germany, assignors to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed March 6, 1899.

656,558. Electrolytic Apparatus. Gerome Loiselet, Paris, France. Filed Nov. 7, 1898.

656,578. System of Electrical Distribution. William J. Davis, Jr., Schenectady, N. Y., assignor to the General Electric Company of New York. Filed June 29, 1900.

656,599. Process of Manufacturing Carbids. Reuben Doolittle, Chicago, Ill., assignor to Mary V. Doolittle, same place. Filed Oct. 16, 1896.

656,600. Means for Manufacturing Carbids. Reuben Doolittle, Chicago, Ill., assignor to Mary V. Doolittle, same place. Original application filed Oct. 16, 1896. Divided and this application filed Oct. 20, 1899.

THE TELEPHONE WORLD.

New Telephone League.

The independent telephone companies of the State of Indiana have formed an organization known as the Indiana Mutual Telephone Association. The object of the association is to see that all members are properly assessed by the State tax board. The claim is made that some companies are taxed unjustly, and the association will attempt to secure as nearly as possible an equal rate, and will ask that all companies be assessed on a basis of their earning capacity, taking into consideration the wear and tear of the plants, etc.

There are between 156 and 170 independent telephone companies in the league. All are not members, but they are affiliated. Harry B. Gates of Indianapolis is secretary and treasurer of the organization. At a meeting held some time ago a tax committee was appointed to see that all companies were taxed justly and it is due to the work of the committee that so many appeals have been filed.

George P. Haywood, of Lafayette, representing the Lafayette Telephone Company, appeared before the board recently in an appeal from the assessment of his company. Mr. Haywood maintained that his company was not making any money and insisted that the present assessment of $41,680 should be reduced to $25,000.

W. H. Ernest, representing the United Telephone Company and also the independent lines in general, said that there were two basic patents pending before the United States Supreme Court, and that if the Bell Company won the case the property of the independent lines will be worth little or nothing. Mr. Ernest called attention to the danger of damage to telephone property, and said that in his opinion the companies were in many cases assessed too high.

William Duff Haynie, of Chicago, appeared before the board and asked for a reduction in the assessment of the Elgin, Joliet & Eastern.

W. M. Lyford, of Chicago, representing the Chicago & Eastern Illinois Railroad also asked for a reduction in the assessment of his company.

It is now reasonably certain that the Buffalo Telephone Company, the new concern which proposes to compete with the Bell monopoly in Buffalo, N. Y., will go before the common council early next month and ask for the privilege of stringing wires, erecting poles and laying conduits. The company has been busy obtaining subscribers and will be ready at that time to convince the aldermen and councilmen that the people of Buffalo are anxious to be released from the extortionate charges and indifferent service of the corporation which has been doing business there according to his own sweet will. "Buffalo people are waking up to the fact," said a telephone man recently, "that there is not another city of its size in the country where telephone charges are so high and the service so poor. There ought to be at least 15,000 telephones in Buffalo whereas the Bell Company has only a few over 5,000. This is all due to the discouraging tolls they charge. In Rochester the independent company is rapidly taking the business away from its older rival after a hard fight was waged by the Bell Company to keep out competition. The new company, I am told, has 2,500 subscribers already, the rates are lower and the service better than ever before."

Mr. J. A. Nolan, a representative of the Munsen Electric Company of Elyria, O., recently appeared before the Batavia, N. Y., board of aldermen, asking to be granted a franchise to set poles, string wires and operate an up-to-date telephone system. He explained that this company had in successful operation a system of from 2,000 to 3,000 telephones, and it was particularly anxious to secure a franchise in Batavia, as that would make a link in the chain from Buffalo to Rochester, N. Y. He then tendered the formal application to the board. Upon motion of one of the aldermen the matter was referred to the board as a committee of the whole to report at the next meeting.

The Huntington (W. Va.) Mutual Telephone Company is suffering much annoyance from people in the suburbs shooting at birds on its telephone cables. A short time ago all the 'phones in the West End were rendered useless by the cables being cut with bullets. It was with great difficulty that the perforations were discovered. The telephone company has now offered a reward of $100 for the arrest of anyone discovered shooting at birds on its cables.

The extensive plant of the Maryland Telephone Construction Company of Baltimore, Md., was destroyed by fire, the origin of which was unknown, on the 22d inst. The loss is estimated at $112,000, of which $75,000 is on the building, and the balance on the stock and tools.

The city of Cambridge, Mass., uses thirty-five telephones, for which it pays the New England Telephone & Telegraph Company $2,600 a year.

Advance in Telephone Rates.

It is said that the Southern Bell Telephone people will shortly announce an increase in rates at Norfolk, Va., which will exactly double the rates now in effect; that is, $30 for business houses and $18 for residence 'phones. The new rates will be $60 and $36. The Bell Company cut its rates in half about three years ago in order to compete with the Southern States Company, which established an extensive system in that locality. The increase of rates means that the Bell Company has abandoned the competition so far as low prices go, at any rate.

Since the announcement that the Bell Telephone Company will double its telephone rates in Norfolk, Va., Portsmouth and Berkley, after the first of next month, several gentlemen are contemplating the organization of a new telephone company, purely a local company, to offer 'phones at much lower rates than the Southern Bell will charge. This action is being discussed upon the assumption that the Bell Company has absorbed the Southern States Company, and will make a uniform high rate. It is said that it is not improbable that the councils will be asked at their next meeting for a franchise for a new company, the franchise fixing a maximum as well as a minimum rate to be charged by the new company.

The advisability of connecting up the different school buildings throughout the city of Reading, Pa., by telephone, is being considered by the school controllers. A careful inquiry has been made of this subject as to what has been done in other towns, and it has been ascertained that wherever the schools have been connected by telephone they claim the service is indispensable. Citizens in communities where the plan has been adopted approve of the reasonable expense incurred by the controllers. Many in Reading hope it will soon be added to the school system.

The bond given by the Binghamton (N. Y.) Telephone Company, as a guaranty of the faithful performance of the work of constructing a telephone system under the franchise granted by the common council, was recently filed at the office of City Clerk Kane. As required by the council, the bond is for $10,000, and the sureties are: W. W. Newell, Postmaster J. H. Roberts, ex Sheriff, A. G. Wales, Police Commissioner T. B. Crary, George C. Bayless and Street Commissioner W. E. Carpenter.

City Electrician Davis of Auburn, Me., has started a movement for placing as many of the electric light and telephone wires as possible upon one set of poles. In some localities there is a pole for every wire. He also advocates other reforms in the street wiring. He has sent a communication to the city government defining his position and the committee on street lights, to whom the matter was referred, will meet to consider it.

The Union Telephone Company of Alma, Mich., has decided to declare a semi-annual dividend of 4 per cent. Since January 1 the company has built 55 miles of new line and reconstructed 105 miles with metallic wire. The total number of miles of line now in operation is 450 with 840 'phones, 300 of which have been added since January 1.

A movement is being projected in Kentucky to build a telephone line from Procter mines, south of Jellico, and Jellico to Williamsburg, Corbin and thence to London and the Pittsburg mines. The scheme was inaugurated at Williamsburg by an independent company, composed of Messrs. Will McLain, the Mahan brothers, J. T. Siler and others.

The Troy Telephone & Telegraph Company, of Cohoes N. Y., is laying a large cable on the poles to contain its telephone wires. It is the intention of the company to remove the wires that have been used separately, thus preventing the lines from crossing and contributing to the unsightliness of the present system. The cable will be extended so as to pass through the principal streets of that city.

The Bell Telephone & Telegraph Company of Montgomery, Ala., is going along steadily in its arrangement to have its wires put underground. It will not take very long to have the change made, and before many months numbers of the poles and wires which overhang the streets of that city will be removed.

The Rawson Electric Company, which has been granted a franchise to construct and operate a telephone plant in Lockport, N. Y., evidently expects to begin work there shortly.

News from San Francisco, Cal., states that one of the largest combinations of capital ever effected on the Pacific coast is about to go into operation. All the telephone companies in that State, Oregon, Washington, Nevada, Idaho and Arizona, have been consolidated under a gigantic corporation. This company is capitalized at $15,000,000.

Several important changes will take place in the general office of the Pennsylvania Telephone Company, of Harrisburg, on or about September 1. Mr. A. D. Reese, the local manager of the Lancaster district, with headquarters in that city, will be transferred to Harrisburg. He will be succeeded in Lancaster by Mr. W. C. Fink, of Harrisburg, who has been connected with the telephone company for some years.

The general route and points to be connected by the newly-formed Co-operant Telephone Company of Dresden Station, N. Y., are as follows: Through Essex, Warren, Saratoga, Rensselaer and Albany Counties, connecting Port Henry, Crown Point, Ticonderoga, Putnam, Dresden, West Haven, Vt., Fair Haven, Vt, Whitehall, Granville, Fort Ann, Fort Edward, Sandy Hill, Glens Falls, Saratoga, Ballston, Mechanicsville, Waterford, Cohoes, Troy and Albany.

Next summer Aroostook County, Maine, will be connected with the outside world by a telephone line from Houlton to Bangor, by way of Island Falls, Patten and Mattawamkeag. Arrangements are being made for the poles to be delivered along the line, and work will begin in the early spring.

At a recent joint session of select and common councils, of McKeesport, Pa., ordinances were passed giving the Central District & Printing Telephone & Telegraph Company, the Federal Telephone Company and the Pittsburg & Allegheny Telephone Company rights of way to lay underground wires through the town.

The Home Telephone Company of Findlay, O., has begun work upon its system. The wires are to be placed underground, and the company expects to have 1,000 'phones in operation by February.

Several residents of Monticello, N. Y., have organized a new telephone company. Twenty shares of $100 were taken, at the first meeting. E. S. Rockafeller is the promoter.

The new telephone line between Groveton and Lancaster, N. H., is about completed.

TELEPHONE INCORPORATIONS.

The Advance Telephone Company, Advance, Ind. Capital stock, $2,000.

The Oakland County Telephone Company, Pontiac, Mich. Capital stock, $50,000.

The Montpelier Telephone Company, Indianapolis, Ind. Capital stock, $25,000.

The Bedford County Telephone Company, Bedford, Pa. Capital stock, $3,500.

The F. E. Bell Telephone Company, Des Plaines, Ill. Capital stock, $10,000. Incorporators: Frank E. Bell, Edward A. Manuel and William Nunn.

The Springville Telephone Company, Springville, N. Y.—Capital stock, $3,000. Directors: M. N. Brooksell, F. D. Smith and A. A. Churchill, of Springville.

The Corning Telephone Company, Corning, N. Y. Capital stock, $1,000. Directors: B. F. Hubbell, C. B. Stowe of Cleveland and G. N. Orcutt of Hornellsville.

The Baldwin Telephone Company, Baldwin, Wis. Officers: President, Dr. George Martin; vice-president, George Pittman; secretary, C. N. Gorham; treasurer, Frank Settergren.

The Bluffton Telephone Company, Bluffton, O.—to build and operate a telephone line. Capital stock, $13,000. Incorporators: A. A. Geiger, F. M. Haller, H. O. Bentley, J. S. Brailey and W. H. Harper, Jr.

The Greeley Independent Telephone Company, Greeley, Col. Capital stock, $15,000. Incorporators: A. W. Trenholm, Bruce F. Johnson, J. E. Neill, George J. Spear, and Fred E. Smith.

The Independent Telephone Company New Augusta, Ind. --to build and operate a telephone exchange. Capital stock, $10,000. Incorporators: M. J. Nagle, W. Johnson, W. B. McDonald, J. Harcourt, G. T. Avery, all of New Augusta.

The Lima Telephone Company, Lima, O.—to do a general telephone and telegraph business. Capital stock, $100,000. Incorporators: H. W. Neff, K. W. Hughes, M. O. Purtscher, W. M. Miller, C. F. Stolzenback; Cable & Parmenter, attorneys, all of Lima, O.

GENERAL NEWS.

What is Going On in the Electrical World.

LIGHTING.

Baltimore, Md.—The electric lighting plant of the Glymont route steamer Estelle Randall is being overhauled. Parts of the machinery have been sent to this city for needed alterations.

Batavia, O—The electric light plant now in course of erection will be completed about September 10.

Billerica, Mass.—This town has voted to erect an electric light plant to cost about $25,000.

Boston, Mass.—Superintendent of Lamps William D. Laug will substitute electricity for gas on a number of streets in this city.

Brockville, Ont.—This city has voted to issue $100,000 in bonds to build an electric light plant.

Cayuga, Ont.—The dynamos of the Electric Light Company here were destroyed by fire last week.

Crawfordsville, Ind.—The city council has decided to make needful repairs and operate its own electric light plant.

Curwensville, Pa.—The Curwensville Electric Company is being organized with J. A. Frank, treasurer. This company proposes to enlarge the present plant and put in machinery.

Dayton, Ky.—The Dayton Electric Light & Power Company, recently incorporated, is advertising for bids for the erection of a new $25,000 plant.

Denver, Col.—The Colorado Springs Electric Company has authorized the announcement of a reduction in the cost of electric light to consumers from 20 cents to 12½ cents per kilowatt. The new rate becomes effective on December 1. General Manager Hine stated that the reduction was due to a new equipment for more economical production.

East Toronto. Ont.—The citizens of this place have voted to issue $7,500 in bonds to build an electric light plant.

Eldora, Ia.—There is a revival of electric light talk, and it now seems probable that a definite proposition will be placed before the town council and the people.

Englishtown, N J—The borough council has awarded a contract to the Freehold Lighting Company to light the streets of the town with electricity.

Grand Forks, N. D.—J. S. Bartholomew will rebuild his electric light plant that was recently destroyed by fire.

Houston, Tex.—A petition is being circulated calling upon the city council to build an electric light plant for which the people have already authorized the issuance of $100,000 in bonds.

Iola, Kan.—Bids will be received until September 11 for the erection of an electric light plant here. Address W. H. McClure, mayor.

Jefferson, Wis.—This city has purchased the electric light plant owned by a private company at a valuation of $25,000.

La Crosse, Wis.—The city council is seriously considering the proposition to purchase a municipal electric lighting plant.

Lafayette, Ind.—The prospects are decidedly encouraging that electric lights will be adopted.

Le Roy, Minn.—Dahler & Bosworth, owners of the electric light plant, have dissolved partnership. Mr. Bosworth will own and continue the electric light business.

Lincoln, Neb.—Sealed proposals will be received at the office of City Engineer Alna Dobson, for lighting the streets and alleys of this city in accordance with the specifications adopted by the city council.

Litchfield, Ill.—This city will build an electric light plant.

Marshalltown, Ia.—The Marshalltown Electric Light Company has brought suit in the Federal Court to restrain the city from enforcing the rates adopted by the city council.

Mayville, Mich.—The council will grant a franchise for a private electric light plant to take the place of the one recently destroyed by fire.

Montreal, Can.—The Hotel Dieu Hospital will be lighted by electricity. Mr. J. Valois, manager of the Chambly Electric Light Company, is putting up 1,500 lights in the institution.

Morrice, Mich.—Dutton & Mackey contemplate building an electric light plant.

Nachitoches, La—The contract has been awarded to O. Ford of St. Louis, Mo., for the erection of an electric light plant here.

Naugatuck, Conn.—This town is considering the question of erecting a municipal electric light plant.

New Castle, Col.—An electric light plant is being talked of and prospects are good for lighting this city by this means in the near future.

New Hartford, Conn.—At a recent town board meeting the Utica Electric Light & Power Company was given a franchise to light the business places and residences here.

Norfolk, Neb.—Norfolk's electric lighting plant will be improved $8,000 worth.

North Platte, Neb.—This place is to have an electric light plant.

Northville, Mich.—The taxpayers of this place are agitating the question of selling the city electric light plant to some responsible company and using the proceeds for bonuses for new factories.

Potsdam, N. Y.—A movement is underway for the organization of a stock company for the purpose of utilizing the latent water power at this village for the generating of electricity to light the streets, business houses and residences of the town. The establishment of a new plant seems to be but a matter of a short time.

Royer's Ford, Pa.—It was decided at a recent council meeting to dispense with the present system of lighting the streets and return to the method that prevailed prior to 1899—that of electric lighting.

Sellwood, Ore.—The Sellwood volunteer fire company is making an effort to get electric lights placed in the fire hall here so that the dangerous lamps used may be done away with.

Shelbyville, Ill.—H. B. Trout was lately granted a franchise to erect an electric light plant here.

Shippensburg, Pa.—John Hosfeld has recently been awarded the electric light contract for this place, and will erect a plant to run by water power.

Shortsville, N. Y.—The electric light contract has been signed by President J.M. Stoddard, so the citizens expect the streets to be lighted in the near future.

Statesville, N. C.—The Statesville Electric Light Company will install additional machinery for enlarging its plant.

Stephen, Minn.—An electric light plant is to be installed here. J. A. Larson, village clerk.

Thorntown, Ind.—This city is to have an electric light plant on the franchise or rented plan.

Virginia City, Mont.—This city is going to have electric lights. The Madison County Power Company, which is putting in a 1,600 horse power plant in the Madison canyon, will deliver the power in the mining camp.

Washington, D. C.—The superintendent of the Chilocca Oklahoma Indian School has been authorized to employ a competent electrical engineer to draw up plans for a new lighting system for the school, which is to be installed at a cost of about $3,000.

Waterbury, Conn.—The Scoville Manufacturing Company of this city is building an electric light plant near the canal for the use of its factory.

West Plains, Mo—It has been decided to issue $27 500 in bonds for the purpose of building an electric light plant and waterworks.

Winchester, Ind.—James W. Stephens of Rossville, Ill., has purchased the Citizens' Electric Light plant in this city.

STREET RAILWAYS.

Charleston, W. Va.—The Fairmont & Clarksburg Electric Company was lately incorporated here by J. N. Camden of Parkersburg and others for the purpose of building an electric railway from Clarksburg to Fairmont. The capital stock is $100,000.

Cheyenne, Wyo.—An electric street railway may soon be operated in this city. A number of prominent Cheyenne business men are working on the scheme and have interested capitalists from the East.

Cleveland, O—Geo. Mulhern, superintendent of the Little Consolidated, said lately, that early next fall his company expects to convert the Payne Avenue cable line into an electric road.

Elizabeth, N. J.—It is said here that the terms of the merger of the trolley interests of John Kean with those of the Hine-Riker syndicate have been settled, and that the consolidation will take place on December 1. Between now and then Mr. Kean will complete his line as far as Cranford. After the merger is effected the syndicate will extend the line to Cranford, out to Springfield, and thence westward into Morris County.

Georgetown, D. C.—It is understood a number of capitalists, including some men from here, are interested in the construction of a new electric railroad in Virginia, which will run to Great Falls.

Lansing, Mich.—Work on the new Lansing, St. Johns & St. Louis Electric Railway has been commenced.

Marysville, O—Dr. Kochendofer of Galion is looking up the prospects for an electric railway from this place to Richwood by way of Magnetic Springs.

Mt. Clemens, Mich.—G. R. Lovejoy, county treasurer, is interested in the proposed electric railway from Lenox to Sanilac Center. It will be 44 miles long and touch Memphis, Emmet, Brockway, Yale and Peck connecting at different points with the Grand Trunk, Michigan Central and Pere Marquette.

Oklahoma City, Okla.—A franchise has been granted by the city council to the Oklahoma City Land & Electric Railway Company for the construction of its line in this city, which will be built at once. Geo. C. Kelley, general manager.

Oley, Pa—At a recent meeting of farmers of the Oley Valley, the project of building an electric railroad through the valley, from Reading to Boyertown, was unanimously indorsed.

Platte City, Mo.—P. A. Gibson, of Kansas City, and others are here as projectors of the new electric line from Kansas City to St. Joseph via Parkville, this city and Dearborn. The capital is ready to put in the line as soon as the right of way is secured.

Providence, R I.—The promoters of the proposed trolley line to Fall River via Seekonk and Swansea expect to enter into direct competition with the steam railroad, it being their intention to make the run from the center of this city to the Fall River City Hall and return in one and a half hours.

Rockville, Md.—The taxpayers of this place recently voted to grant a franchise through Rockville to the Courthouse to the Washington & Rockville Electric Railway Company.

Selma, Ala.—The question of adopting electric motive power on the street car system in this city to take the place of the present mule power is being considered.

Trenton, N. J.—A syndicate headed by the Williamson heirs, of this city, and several New York and Philadelphia capitalists, has succeeded in securing franchises that will permit of the construction of a complete trolley road from Harrisburg, Pa., to New York.

MANUFACTURING.

Denver, Col.—A new industry for the manufacture of electric drills for mining operations is about to be started here. Negotiations are now pending for a site for the enterprise, which will have its machinery installed to turn out the finished product within the next ninety days. John McDonough is in the East buying the machinery, having $100,000 set apart for this purpose by the new corporation, which is known as the New Era Electric Company.

Dunmore, Pa.—The Dunmore Steel & Iron Company recently decided to equip its plant with electricity and placed an order with the Sprague Electric Company in New York for two split pole generators and 50 motors. The generators are 62½ and 100 kilowatts and the motors range from 3 to 20 horse power.

COMPANY MATTERS.

Bay City, Mich.—The Lowell-Muncey Electric Company recently changed its name to the Muncey-McLaughlin Electric Company, and will do all kinds of electrical construction, electrical and mechanical engineering and repair work.

Chicago, Ill.—The Western Electric Company has purchased all of the extensive dock property at the river and West Polk street formerly occupied by the Young & Farrell Diamond Stone Sawing Company. The purchase represents an outlay of $617 500 and an expenditure of $1,000,000 in improvements is predicted.

Dubuque, Ia—A deal was closed recently for the consolidation of the street railway and electric light plants of this city. The new company will have a capital stock of $1,000,000 and a charter for fifty years. The officers are: F. D Stout, president; W. S Molo, vice president; E. A. Engler, secretary, and George Kiezel, treasurer. Improvements to the extent of $100,000 will be made.

POWER AND TRANSMISSION PLANTS.

Manchester, Va.—The Virginia Electrical Railway & Development Company has contracted with the Richmond Electrical Company of this city to furnish the power necessary to run the latter plant when it shall have been completed.

Ohiopyle, Pa.—Ohiopyle Falls will be harnessed for power to generate electricity for the operation of a trolley system.

Portland, Ore.—Mr. Hurlburt has recently made surveys in the vicinity of Hurlburt and Gordon Creeks, where the water fall has been carefully measured and the volume of water estimated. It would turn a number of turbine wheels, and might be useful in the establishment of an electric plant to compete with the one that supplies this city.

Toccoa, Ga.—The Toccoa Falls Light & Power Company has lately been incorporated to develop water and electric power with a capital stock of $50,000. Among those interested are E. P. Simpson, S. V. Davenport and L. A. Simpson.

MINES.

Colorado Springs, Col.—Arrangements are being made by the Pike's Peak Coal Company to operate the Carlton coal mines north of this city by electricity.

AUTOMOBILES.

Chicago, Ill.—Articles of incorporation and charter of the Woods-Morton Cab Company have recently been filed. The incorporators are Harry Goodman, C. F. B. Goodspeed and Arthur B. Schaffner. The object is to let, hire, manufacture and sell cabs and automobiles. The company has a capital of $500,000.

Muncie, Ind.—Three automobiles are being constructed at the present time in this city. Mr. Cary Crozier is constructing one for private use, and W. F. Warner, superintendent of the Muncie Electric Lighting Company, also has one under construction. Walter Carpenter is building the third. The machines will all be operated by electricity.

New York City.—The General Automobile Company was recently formed here with a capital of $125,000.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16⅝c.; Lake, 16⅝@16¾c.; casting, 16⅜@16½c.

Stockholders of the Union Traction Company of Philadelphia will hold their annual meeting September 19

Advices from Rochester, N. Y., state that the Sodus Bay Railway, an electric line, was opened for business on the 22d inst.

Officials say that the Metropolitan Street Railway Company's annual report will probably not be issued before September 1.

The Philadelphia Glenside & Willow Grove Railway, capital $100,000, has been chartered to build a six mile trolley from Cheltenham to Abington.

Directors of the Scranton, Pa., Railway Company have declared a dividend of 1 per cent. on the stock, payable September 1, to holders of record August 28.

Rumor has it that the report of the Erie Telephone and Telegraph Company for the year ended June 30 will show an increase of 41 per cent. in net earnings.

Of the $1,000,000 new 5 per cent. bonds of the Union Traction Company of Indiana offered in Philadelphia all but about $80,000 have been placed with investors.

Advices from Elizabeth, N. J., state that a consolidation of the extensive trolley interests of Senator Kean with those of the Hine-Riker syndicate has been agreed upon.

The Street Railway & Illuminating Company of Boston has declared a dividend of $3 per share on its common stock, payable August 29. Books closed August 23 and reopen August 29 (to-day).

The Wisconsin Traction, Light, Heat, & Power Company has filed articles of incorporation with the register of deeds. The company is said to control every electric plant and system in the State.

The latest quotations for some of the new industrial stocks, not given elsewhere; are: Electric Boat, 13@16; New York Electric Vehicle Transportation, 7½@8, New England Transportation, 3¾@4; Gramophone, 35@40.

The Brooklyn Union Elevated Railroad has obtained a writ of certiorari from Justice Mattice, in the Supreme Court, to allow the reclamation of the old Brighton Beach, Railroad, which was sold for taxes in 1895. It is now owned by the Kings County Elevated Railroad Company.

The reorganization committee of the Toledo, St. Louis & Kansas City Railroad Company gives notice that the second installment of $5 per share on the preferred stock and $3 per share on the common must be paid to the Central Trust Company by September 5. Certificates must be presented for endorsement.

The receivership of the Duluth Street Railway Company of Duluth, Minn., has just been terminated by order of the district court and the receiver discharged, and the new company has recorded a first mortgage to the Central Trust Company of New York covering five per cent. bonds for $2 500,000 issued to take up outstanding indebtedness and extend the lines of the company.

The Brooklyn Heights Railroad Company reports for the quarter ending June 30 as follows: Gross, $3,091,073; operating expenses, $1,779,044; net, $1 312,029; other income, $85 357; total net, $1,397,386; charges, $1,132,82; balance, $264,494; operating cost 1900, 57 55 per cent of earnings (excluding all taxes). Operating cost 1899, 59 56 per cent of earnings (excluding all taxes).

Referring to the copper market the Boston "News Bureau" says: Transactions in copper are in fair volume, and market has a very firm appearance at 16⅝ cents for lake, and 16½ for electrolytic. Although the market does not appear liable to any sudden changes, the trend nevertheless has recently been in an upward direction, and it is not improbable that higher figures may be gradually realized.

A semi-annual dividend of 2½ per cent. has been declared by the Electric Association (Postal Telegraph Company employes). The association is lending money steadily at 6 per cent. interest and 20 cents monthly premiums on each $200 share. A good many of the old borrowers on bond and mortgage have taken advantage of a new section in the articles, which gives them the option of refunding their mortgages at 6 per cent. flat.

The Pittsburg Consolidated Traction showed a surplus over the preferred dividend for the four months ended July 31, 1900, of $35,423. As it takes $300,000 to pay 2 per cent. per annum on the $15,000,000 common stock, the proposition of the Union Traction Company, of Pittsburg, which is consolidating the traction systems of that city, seems inviting to Pittsburg Consolidated common stockholders. As is well known, the Union Company organizers have not hesitated to guarantee a sliding scale of dividends on Consolidated Traction Company common, beginning the first year at 2 per cent.

A director of the Electric Company of America says: "Net profits from our regular sources of income for the first six months of 1900 were considerably ahead of the first half of 1899. We had the benefit, however, in that time, of the earnings of two Long Island properties which we do not now own. The proceeds from their sale have not been invested. We are looking at two or three properties, but are not in a special hurry to invest the money. We are getting 2 per cent. on it as a bank deposit. When we buy a property, we want to see 10 per cent. earned on it under its own operation. If it can earn 10 per cent. under its management, it can usually be made to earn more under ours."

The Philadelphia "Stockholder" says: There is a large local interest in securities of the Union Traction Company, of Chicago, and those who are chiefly concerned say that the stock is on its way to higher prices. The claim is made that the company's position is all right. Of course, there is keen competition by the Northwestern Elevated, but confidence is expressed that all the traffic diverted from the Union Company will shortly be regained. Officials report that for the present month thus far earnings have shown considerable improvement. The West Side lines have made big gains, and as nearly as can be ascertained the decrease in earnings of the North Side line (the one affected by the Northwestern's competition) has been greatly lessened. The system's suburban lines are said to be doing a splendid business.

An official of the American Telephone and Telegraph Company gives out correct figures regarding the capitalization and bonded debt of the American Telephone & Telegraph Company (Long Distance), from which it may be inferred that the $32,000,000 Long Distance stock in the American Bell Company's treasury will be divided among the Bell shareholders, making the third share as was expected in the change of Bell stock for Long Distance, or the entire amount of stock will be returned to the Long Distance Company's treasury. The situation is practically as follows: The total American Telephone & Telegraph Company capital issued and subscribed for is distributed as follows: American Bell stockholders, $52 000,000; In the Bell treasury representing original investment of Bell in Long Distance Company, $32 000,000; August 15 payment of subscription, $5,000,000; payment January 15, $5,000,000; total, $94 000,000. It is the $32,000,000 represented by the original investment in the Long Distance Company by the Bell that will be divided or returned to the Long Distance treasury. If returned to the Long Distance treasury, the outstanding capital January 15 would be $62,000,000. Bonds issued, $6,000,000; sold recently, $4,000,000; option given on, $5,000,000; total, $15,000,000. All bonds are 4 per cent, secured by collateral. Stocks of the subsidiary companies are owned by the Bell.

ELECTRICITY.

Vol. XIX. NEW YORK, SEPTEMBER 5, 1900. No. 9

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4021 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES, ...	$2.50
IN CLUBS OF FIVE OR MORE, . . .	2.00
FOREIGN COUNTRIES, ...	4.50
SINGLE COPIES, ...	10 cents

Remit by Express, Money Order, Draft, Post Office Order or Registered Letter.

ADVERTISING RATES.

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application.

Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter

EDITORIAL NOTES.

Electrical Undertakings in Russia.

Russia during the past year has been arranging to expend large sums of money in perfecting its electrical systems or in starting up new undertakings. One of the enterprises about to be embarked in consists in utilizing the falls in the River Dnieper for the production of electrical power. The plans have been worked out by a corps of Russian army engineers, and with these a company has been formed, which has set apart $3,000,000 for the purpose of carrying them out as soon as the concession is granted by the Government. The company proposes to make the Dnieper navigable from Ekaterinoslay to Alexandrovsk and transfer the power from the falls to the former city, where, of late, numerous factories, mills and mines have been opened.

At Vladivostock a new electric railway and electric light system are about to be established, while in Moscow and St. Petersburg steps have been taken looking to the establishment of various American manufacturing plants to cost in the neighborhood of $6,000,000.

Referring some time ago to the use of American made machinery in Russia, Mr. Thomas Smith, Consul of the United States at Moscow, said:

"American machinery will drive out English and German machines within the next ten years. When American machinery began to invade Russia, the employers and the operatives were doubtful about its lasting quality. They had become accustomed to the clumsier and heavier machinery supplied by Great Britain, and they feared that the lighter machines from this country would break down and become worthless. They have discovered that the better grade of material used in the construction of the American machines insures their durability, while their lightness makes operation much easier and quicker. Shortly before coming away I visited a factory where English, German and American lathes are used side by side. There is intense rivalry on the part of the Russian workmen in this shop to get assigned to the Yankee machines. One manufacturer told me that he had four times cut down the wages of the men on the American machines, because they made so much more money than their associates. He had to make the cut in order to allay the discontent on the part of the men running the older German and English machines."

But Russia is not alone interested in the development of its water power, the lighting of its cities by electricity and the adoption of up-to-date machinery in its factories. Attention is also being paid to its telephone systems, the latest advices stating that on November 1, 1901, the systems in St. Petersburg, Moscow, Warsaw, Odessa and Riga will be transferred from the hands of the Bell Company into that of the Russian State whence they will be re-transferred to private parties or companies. In this connection it is worthy of note that all foreigners may compete and obtain the concessions. We think it scarcely likely, however, that capitalists on this side of the Atlantic will care to invest in telephone undertakings in Russia, when there are so much more promising telephone fields nearer at hand, but it is nevertheless interesting to know that the Russian Government has made the competition an international one.

* * *

Two Electrical Surprises.

An important electrical decision was rendered last week by a United States Court Judge in favor of Mr. Nikola Tesla, and on the day following the rendering of the decision one of the New York daily papers announced in display type that Mr. Thomas A. Edison was almost ready to make public details of his newest startling invention.

Naturally two events of this nature created great interest in electrical circles, and it is with pleasure that we record the fact that Messrs. Tesla and Edison are receiving unstinted praise from the daily press.

The decision above referred to was rendered by Judge Townsend of the United States District Court at New Haven, Conn. It was a case which had in question the inventions of Nikola Tesla. It related to three inventions by Tesla—one of an electric magnetic motor, another on the electrical transmission of power, and the third for a specific construction of a motor embodying the invention of the other two patents. The main point is that by the Tesla invention there is not the waste of electric energy that there was under the old arrangement.

The defendants in the case were the New England Granite Company and others, and it was alleged that they had been using Tesla's

Digitized by Google

inventions in mining and other operations. Judge Townsend upheld the plaintiff and, what is rare in a judicial opinion, paid a remarkable eulogy to Tesla. He said:

"A careful study of the evidence shows that Tesla has made a brilliant discovery. It remained to the genius of Tesla to capture the unruly, unrestrained and hitherto opposing elements in the field of nature and art and to harness them to draw the machines of man. It was he who first showed how to transform the toy of Arago into an engine of power; the laboratory experiment of Bailey into a practically successful motor; the indicator into a driver. He first conceived the idea that the very impediments of reversal in direction, the contradictions of alternatives might be transformed into power, producing rotations, a whirling field of force. What others looked upon as only invincible barriers, impassable currents and contradictory forces, he seized and by harmonizing their directions utilized in practical motors in distant cities the power of Niagara.

"A decree may be entered for an injunction and an accounting as to all the claims in suit."

The opinion described the elements involved in the case.

It is needless to say that Mr. Tesla was delighted to have recognition of the practical usefulness of his machines from a Judge who had gone out of his way to express his sense of the value of the Tesla electrical inventions. Mr. Tesla said that however much his inventions may have been utilized in the Niagara and other plants on the coast and in the Western mining camps, the credit of the details belonged not to him but to the engineers who had applied the Tesla system to the particular problems that were to be solved.

The decision sets a new standard for electrical patentees and protects the inventor from the use of his discoveries by any other than the company owning his inventions. The case will undoubtedly go to the Supreme Court, as the contentions involved are of unusual importance.

Regarding Mr. Edison's latest invention, we publish the article referred to on another page of this issue of ELECTRICITY. Of course it may prove to be a Kansas cyclone—nothing but wind—still we owe it to our readers to keep them posted on Mr. Edison's latest movements, and we will wait with great anxiety until September 15, the date set by the "promoters of the scheme to announce the new invention."

* * *

American Coal for Foreign Consumption. According to Mr. C. J. Wittenberg, president of the Chesapeake & Ohio Coal and Coke Company, who recently returned to this country from abroad, there is an excellent opportunity, if only taken advantage of, for dealers in this country to gain a prominent foothold in the coal markets of the various countries on the continent of Europe. As was stated some time ago in these columns, many of the electric lighting and manufacturing plants, more especially in Russia and Germany, were a few months ago almost destitute of fuel, owing to the inability of obtaining sufficient coal from Great Britain, with the result that many factory and other kindred industry owners are said to be looking into the feasibility of obtaining fuel from the United States.

The gentleman quoted above referring to this subject says:

"In 1899, England's shipments of coal to countries which we can reach exceeded thirty million tons. Up to ten years ago she had about all the West Indian and South American coal trade, most of which we have taken from her. We can now get our share of the world's trade, if we can get the ships. But the coal men of the country need to be aroused on the matter.

"While I was abroad I noticed a remarkable inquiry for American coal. The number of the people who called upon me in Paris to obtain data on the subject was astonishing. And in Denmark there was a special interest in the matter taken by the big gas concerns. The American coal exhibits at the Paris Exposition are attracting a great deal of interest, but they are so poorly accommodated, in out of the way quarters, that they are not shown to best advantage.

"Inquiries are being made for American coal by both the French and the Italian Governments for their respective navies. About July 1 there was a bill introduced in the British Parliament to prohibit the exportation of smokeless coal from Great Britain. It was argued that smokeless coal was like smokeless powder, and should be regarded as too precious to sell to other nations. No decisive action has been taken on this bill, but the French Government, in alarm, at once placed large orders for smokeless coal in England. Still fearing that it may never be able to have them filled, it is now on the lookout to get its coal from America, if need be.

"The principal points to which it would now be advatageous to us to ship coal would be on the Mediterranean, of course, because the low freight rates from England to other European centers make it hard for us to compete with Great Britain. As far as quality goes, the best American coal can about equal the coal from Cardiff, Wales, which is the best in Great Britain. Our coal is not so lumpy as the Cardiff coal, but that is really nothing in favor of the British product, though there is a prejudice for lumpiness in Europe. The British coal costs $7.50 at Cardiff, and can be delivered at $10 a ton on the Mediterranean. Ours costs $2.50 at Newport News, and can be delivered at about $7.60 on the Mediterranean. But we are sending very little thither, because we cannot get the ships."

After stating that most of the interests in England owning coal-carrying vessels are also interested in the British mines, Mr. Wittenberg adds that "if we could only have a subsidy measure passed which would encourage the building of American ships we could quickly build up a coal-carrying trade. We could build fully as good ships as they have abroad. I think even with the vessels diverted to transport service back at our disposal that coal freights to the Mediterranean would come down from $5 to $4 or $3.50 a ton, and enable us to undersell the British in Italy from $3.50 to $4 a ton."

In this connection it is interesting to note that the aggregate exports of coal from the United Kingdom for the six months ending June 30, this year, were 22,063,206 tons as compared with 20,990,630 tons in the corresponding period of 1899. Of this amount 4,230,783 tons went to France, 2,704,757 tons to Germany, 2,625,913 tons to Italy, the remainder being distributed between Russia, Sweden, Norway, Denmark, Holland, Spain, Portugal and other minor countries.

These figures will give our coal dealers some idea of the strong hold England has on the coal markets of the world, but in spite of this fact if sufficient interest is aroused, there would seem to be no valid reason why American coal should not ultimately be burned to run lighting, street railway and manufacturing plants in many European countries.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

INVITATIONS are out for the 22d annual Rhode Island clam dinner tendered to the electrical fraternity by Mr. Eugene F. Phillips, general manager of the American Electrical Works of Providence, R. I., at Pomham Club on September 13.

EXPORTS of American tools and machinery do not show the shrinkage in volume which recent reports would indicate. In exports of sewing machines, typewriters, electrical and other intricate machinery there are gratifying increases. Comparing the export figures of the fiscal year just ended with those of 1898 and 1899, it was found that electrical machinery increased from $2,052,564 in 1898, and $2,736,110 in 1899 to $4,328,917 in 1900.

WORKS for the generation of electric currents for various purposes are to be erected by Messrs. B. Egger & Co., of Vienna, Austria, in Thurmitz, North Bohemia. Water power will be utilized. Considerable machinery and supplies will be required for the undertaking.

THE Niagara Preserving Company at Lockport, N. Y., recently began to operate the machinery of its large plant by electric power received from Niagara Falls. The concern claims to be the only preserving plant in the world which operates by electricity.

COMPARATIVE tests were begun recently by the Equipment Department, upon a submarine electric light, used by divers. A diver of the Construction Department was sent down near the sea wall at the Navy Yard, in Brooklyn, near the launching ways. He used both the submarine light now in use by the Navy and the other which the Naval Electric Company of New York submitted for test. The test was ordered by the Bureau of Equipment at Washington and all reports will be forwarded there.

CONGRATULATORY messages from President McKinley and the German Emperor were flashed, on August 30, across the new German cable, to be operated in conjunction with the Commercial Cable Company's system from New York to Fayal and thence to Emden, Germany. This was the opening of the first direct telegraphic communication between the United States and Germany. This new submarine cable starts at Emden, Germany, touches at Fayal, in the Azores, and ends at Coney Island. The cost is placed at about $5,000,000. The stretch of cable between the Azores and Coney Island is about 2,279 miles long. The headquarters of the German branch of the new cable is at Cologne. Authorization to begin the work was given in April, 1899, by President McKinley, and shortly afterward by the German Emperor.

THE following extract from a sermon on "Burden Bearing," delivered by the Rev. W.

Digitized by Google

Muzzel at St. Paul's, Withington, England, will be of interest to our gas friends. In this sermon the rector said that "nature was often made to share our burdens, and he wished the people of that church would assist nature by illuminating the place with the electric light, so that their lives might be spared for a few years, as God intended them to be spared, instead of running the risk of being poisoned by having to breathe (especially in the warm weather) the vitiated and poisonous atmosphere caused by bad gas."

Gen. Buller, the British commander, is said to be a good electrical engineer.

Judge Dissette, of Cleveland, O., has granted an injunction in favor of a young lady restraining a young man from making love to her or even calling her up by telephone.

The Union Traction Company of Philadelphia is experimenting with a new arrangement consisting of an application of ball-bearing axles. To use the contrivance, it is said, it is not necessary to have a specially built car, as it can be applied to any axle. The idea is still in its infancy, and although the Traction Company is making comparative estimates for the use of electric motors on the new and several of the old cars, no data are as yet prepared.

A good instance of the enormous growth and importance of the electro-chemical industry in the United States is afforded by the huge power plant of the St. Lawrence Power Company at Messena Springs, N. Y. This installation will take advantage of an extremely curious configuration of the country, whereby the St. Lawrence River is nearly fifty feet higher than one of its tributaries, the Grass River, which is only three miles distant. A canal cut across this short stretch of country gives one of the best water powers in the world and no less than 150,000 horse-power, or three times that generated in the great plant at Niagara, will be produced. All of this gigantic power will be used on the spot in electrolytic processes for the manufacture of calcium carbide, bleaching powder, alkali, etc.

The long-distance telephone is proving a boon to the commission man at the stock yards and his shippers in the country. The latter depends for advice on the stock yarder' They wait his admonition to ship in their stock and hasten to profit by it. Formerly this information was transmitted by telegraph. The operator at the nearest railroad station sent the message out to the stock man, probably several miles away, consuming much valuable time. The long-distance 'phone is effecting a radical change, and will be as important as the daily rural mail route before long, and promises to fill a much more important sphere.

A recent issue of "Stahl und Eisen" contains an article in which the author, Dr. Frank, proposes to utilize the great peat beds of North Germany for the production of electricity on a large scale, says our London namesake. He estimates that a hectare of turf, 3 meters thick, gives 2,500 tons of dry turf, equivalent to 1,200 tons of coke, or in Enlish measure an acre of turf, 10 feet thick, gives 1,000 tons of dry turf, equivalent of 480 tons of coke. The mosses of the Evus Valley, which cover an area of 1,000 square miles, might furnish the equivalent of 300,000,000 tons of pit coal; that is to say, more than the total production of Germany for three years. The turf would be burnt at central stations of 10,000 horse-power capacity, consuming annually 200,000 tons of turf, the product of 200 acres of the beds. One application of the power produced would be to the service of the canal connecting Dortmund to the Evus, which will soon be finished; but the author thinks the most interesting will be the manufacture of acetylene, the materials for which can be obtained easily and cheaply in the neighborhood. With 10,000 horse-power a quantity of acetylene can be produced daily, equivalent for lighting purposes to 150,000 gallons of petroleum, or annually in value to 20,000 tons of foreign imported petroleum.

A new substitute for celluloid for engineering and other industrial purposes is described, says the London "Electrician," in a German paper. The name of this new substitute is "Marloid," and it seems that it is manufactured from untanned leather boiled in oil. The product is said to resemble celluloid in every respect.

The contract between the United States Government and the Third Avenue Railroad Company of New York for carrying the mails expired on September 1. Some weeks ago the Metropolitan Street Railway Company, which now owns the Third Avenue road, notified the Postoffice Department that it would not renew the contract. The Government has not as yet made any contract in place of the one that has expired, and until it can make other arrangements the Third Avenue road will continue to carry the mails. The Postmaster of New York has recommended to the department at Washington that a contract be made with the Manhattan Elevated Company.

Freight will be transported over the local lines of the Milwaukee (Wis.) Electric Railway & Light Company within a few years, probably two, if the company sees that the coast is clear. For such work it will be necessary to use specially constructed cars.

The recent experiment conducted at Hartford, Conn., with automobiles for the collection of mail carried on by the Electric Vehicle Company, for the purpose of ascertaining what the requirements of the mail service are, and therefore enabling them to produce a machine especially adapted to that purpose, has proven of considerable value to the postoffice officials and the company. Although it was not expected that the wagons used in this experiment would be adopted by the Government, they nevertheless served admirably and accomplished the purpose of the company, and have given very little trouble under the present system of operating. It is anticipated that it may only be a short time before automobiles will be regularly used for the collection of mail, as well as for many other similar purposes,

Dr. Heber Robarts is at the head of a syndicate of St. Louis capitalists which proposes to build an electrical sanitarium in that city. "The hospital will be as nearly a battery in every corner and crevice as we can make it," said Dr. Robarts. "It will be fitted with every kind and variety of electrical apparatus that has anything to do with the generation of currents. The expenditure of a large sum of money will be necessary to provide us with these appliances as all of them are of the most delicate order, but we will be able to command the funds needed. The hospital will be a thoroughly legitimate institution. It will not be operated on a cure-all basis. We will simply take patients and treat them, obtaining the best results we can. I will have a staff of assistants and they, like myself, will be regular practitioners of medicine, who have devoted special attention to electricity as a therapeutic agency. Our plan is to devote special consideration to chronic troubles that cannot be treated properly in the old way. There are also many diseases that the profession has until recently considered incurable. Among these are external cancers, lupus, chronic rheumatism and eczema. Late experiments have shown conclusively that these can be cured by the use of electricity. We have no intention of abandoning medicine. On the contrary, we shall use it with great freedom. We will not administer it, however, in the old way. We will diffuse it through the affected parts by the use of electric current over electrodes. This process is technically known as cataphoresis."

A curious telephone phenomenon has been reported to a Belgian scientific society by M. E. Piérard. He found that if a metallic diaphragm is vibrating under the action of the human voice, for example, and a platinum point touched a small platinum plate soldered to the middle of the diaphragm, the apparatus acted as a telephone transmitter, even if no battery were employed with it. By carefully eliminating all possibility of any action analogous to that of the string telephone, and by introducing an induction coil between the transmitter and receiver, the action of the apparatus was clearly shown to be electrical. The only source of electricity possible in such an apparatus was the contact of dissimilar metals at the point where the platinum disk was soldered to the back of the diaphragm. Careful investigation showed that this explanation solved the mystery. The discovery is of no practical value, except as another means of showing the exquisite sensitiveness of the telephone.

It has been decided by Director of Works Carlton that there will be no night work on the electric tower in course of construction at the Pan-American Exposition grounds at Buffalo, N. Y. The electric tower will be about the most brilliant feature of the Pan-American, and it is highly important that it be finished in time. The contractors are behind time in their work now, and every means is being resorted to to complete the steel structure. But the humanity of the director of works outweighs his ambition to have the tower done in time. After a thorough investigation into the question of working at night, Mr. Carlton came to the conclusion that it was an extremely dangerous thing to do, and so the plan was dropped. "It would mean death to some of the workmen, I am afraid, if we worked at night," said Mr. Carlton, recently. "The men who run about narrow timbers and ticklish perches hundreds of feet above the ground are apparently without fear of falling. But they are accustomed to having daylight in under them, and the most daring of them would suffer from a nervous dread at night. No matter how the lights were arranged shadows would be cast of the most deceptive nature and it is almost positive that accidents, which could only result in death, would happen."

Digitized by Google

THE BOIS DE BOULOGNE COMBINED TROLLEY AND SURFACE CONTACT TRAMWAY.*

M. Vedovelli's system of electric traction with surface contacts has just been applied to the Bois de Boulogne Railway which extends from the Neuilly Gate to Saint Cloud, passing along the Bois de Boulogne, passing in succession through the Sablous Gate and the Madrid Gate, following the Seine for about 1,500 meters and crossing it at the Suresnes Bridge and arriving at the terminus at the summit of the Val d'Or. The traction is of a mixed character, the line being divided into nine sections worked alternately by the trolley system and by surface contacts. The contact system was ordered by the administration to be used at the gates and at all points where it was considered that the overhead line would detract from the beauty of the scenery of which Paris has every reason to be proud. Fig. 1 shows a view of the station at the Neuilly Gate; at the starting point the overhead wire is used.

Near the Hippodrome at Longchamps, before arriving at the Suresnes Bridge, a loop line has been made in order to allow of a special service between the Suresnes Bridge and the Neuilly Gate.

It was necessary to arrange for this service for those days when, owing to attractions of the Hippodrome, the traffic will be considerably increased. It was really the importance of this traffic that decided the employment of the contact system and caused it to be chosen in preference to the other, without taking into account considerations of economy.

The line being divided into various sections, it was desired to avoid the stoppages and jerks that might occur in passing from one system to the other. With the contact system the change in the mode of working is effected at the normal speed. To do this the trolley line is continued for some meters over the contact line, so that for a few seconds the car is receiving the energy both through the wire and through the contact blocks. Moreover, in order to facilitate the resumption of the wire, a bow is used which is brought to rest automatically on the line at the moment it comes into action. Fig. 2 is a view of the surface contact line.

The Bridge of Suresnes is traversed by a single line worked by contacts. The plant was supplied by the Fives-Lille Company. It consists of two groups of generators, one of 400 kw. power, the other, which acts as a reserve, of 250 kw.

The steam engines are of the well-known horizontal Fives-Lille type with four distributors. The dynamos are over-compound 500-volt machines.

Two feeders start from the board, one supplying the up line, and the other the down line, and are branched into the section comprised between Longchamps and the Neuilly Gate.

This board is furnished with the ordinary measuring and safety apparatus, voltmeter, amperemeter, lightning conductor, and automatic circuit breakers.

The rolling stock consists of motor cars and trailers. The cars measure 9.40 meters between the buffers, and are mounted on two pairs of wheels. The distance between the axles is 4.80 meters. The curves of the track have at several points a very short radius (25 meters), and in order to round them the axles have had to be mounted on converging jointed trucks, which act very satisfactorily.

Fig. 3 shows a diagram of M. Vedovelli's system of line with surface contacts.

L is the line conveying the current, P_1, P_2, P_3, the contact studs over which the contact bar, B B^1, of the tramway passes in succession, and receives the current, which passes on to the electric motors, returning to the station by the rail.

The tramcar goes in the direction of the arrow F.

Referring to the contact bar at the moment it receives, normally, current from the stud P_1, as soon as the extremity, B, of the bar touches the stud, P_2, a derived current passes through a solenoid, S_2, of fine wire, and returns to earth, i.e., to the rail, by the two terminals, a_2, and b_2, connected on short circuit by a bridge-piece, K_2, which is movable round an axis of

FIG. 1.

rotation, O_2. The solenoid contains an armature of soft iron connected with the supporting lever of the bridge-piece, K_2, so that when the solenoid receives the current and attracts its armature, the bridge-piece, K_2, is raised vertically. It leaves the terminals, a_2 and b_2, on which it rested freely, and bears heavily on the terminals, c_2 and d_2, which it short circuits. Now the terminal, d_2, receives the current directly from the line, the stud, P_2, comes, therefore, into metallic connection with the main line, L. The stud, P_1, remains capable of feeding the contact bar of the tramway until the next stud, P_2, has in its turn been brought into metallic connection with the line, L. Now when the bar, still traveling in the direction of the arrow, F, has passed into the position shown by the dotted lines in the figure, the solenoid, S_3, following the mechanism explained above, will have attracted its armature, and the bridge-piece, K_3, having connected the terminals, c_3 d_3, will, on the contrary, have cut the circuit between the terminals, a_2 and b_2. The derived current passing through the solenoid, S_2, is therefore interrupted at these points. The armature, K_2, falls back upon the terminals, a_2 b_2, and the terminals, c_2 d_2, are disconnected. The stud, P_2, is thus also disconnected.

Thus by a very simple arrangement the introduction into the circuit of one stud shuts the preceding stud out of the circuit.

By virtue of a very ingenious device, the bridge-piece, K, only leaves the terminals, *a b*, after having connected the terminals, *c d*. It follows from this arrangement:—(1) That the main current is brought to the stud required by the contact bar, and that the closing of the studs, *c d*, does not serve to establish the main current; (2) that the terminals, *c d*, are disconnected when the stud about to be released is still in contact with the bar. These terminals, therefore, do not serve to break the current, which is always done in the contact bar.

It is, in fact, of the highest importance for the good working and the durability of the apparatus that the terminals, *c, d*, should be used, not as interrupters, which would be the seat of sparks and so be rendered liable to rapid burning up, but as commutators connecting or separating metallic terminals, brought to the same potential, no spark between them being then possible.

We have supposed the tramway to be working normally. At the commencement the first stud will evidently receive the current either from the trolley or from a stud charged by hand as the cars start from the works. The last stud of a section consists simply of a commutator of the ordinary type, of which the terminal, *d*, remains insulated and the solenoid is directly connected with the rail.

M. Vedovelli's tramway, like all others of the kind, is provided with a safety apparatus, in order to prevent a stud from being uncovered by the vehicle while it is still charged. This arrangement consists in this case of a pendant chain connected permanently with the earth and brushing in succession the studs released by the car. If by accident one of these studs remained charged, the chain by its contact would produce a short circuit on the line, and would bring about either the melting of the safety fuses placed in the corresponding distributor, or the release of the automatic circuit-breaker of the central station.

M. Vedovelli's system, by the very fact that the stud when charged effects by its introduction into the circuit the release of the preceding stud, gives the vehicle a well defined rate of proceeding. The mechanism which we have described for the successive excitation and release of the studs is not reversible.

In cases where the requirements of the road necessitate the establishment of a single line, and where consequently we are obliged to have vehicles traveling in both directions on the same line, a simple solution of the problem is to supply the track with a double series of distributors; some feeding the up line and some the down line.

In this case, in order to prevent the studs of the up line from being charged by the up cars, the extremities of the solenoids may be connected with a common earth wire which will be insulated from or brought into contact with the rail as required, by a single commutator worked automatically by the vehicle itself.

We may also remark that in order to reverse the action of the distributors, we have only to switch the connections to earth of the solenoids which are to be connected with the right hand commutator in the case where the direction in

*Paper read by M. X. Gosselin before the Societe Internationale des Electriciens and translated from the Journal of the Society by the London "Electrical Review."

Digitized by Google

which the car is proceeding is the opposite one to that indicated by the arrow. This reversal of the connections may be effected by means of a simple two-way commutator placed in the distributor.

The contact studs are placed at intervals of 3 meters and the distributors, 10 in number, are placed in leaden boxes along the side of the

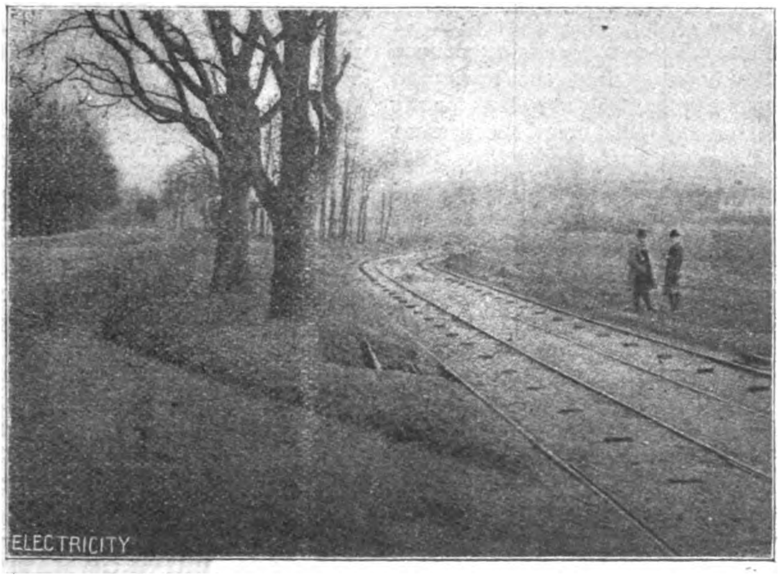

Fig. 2.

track. A single commutator then controls the whole of the corresponding section, and can be manipulated automatically by the passing of the train.

This subjection of the direction of the car to that of the action of the distributors occurs inevitably in all tramway systems worked by contacts in which the stud charged cuts off the current from the disconnected stud.

In certain instances this inconvenience becomes a real advantage, as the electric system of feeding constitutes in itself an inviolable automatic block system.

It will be noticed that the tram when in motion never covers more than two studs. The track therefore becomes free as soon as the vehicle has passed, and a second car can follow at an interval of a few meters.

This is an advantage over some systems in which the line has to be divided into sections which one car, and only one, must occupy at a time, or a stoppage will be occasioned in the normal distribution of the current.

One of the contingencies to be provided against in the stud system of tramways is the failure of the bar to make contact with a stud, either through the bad working of one of the distributors or through the accidental interposition of some insulating material, a piece of wood, sheet of paper, etc.

In the system we are describing, if the car fails to make contact with a stud, the preceding one is not disconnected, and the safety chains on touching it produce a short circuit which brings into action the fusible safety apparatus or automatic circuit breakers.

The current is thus broken on the disconnected stud. By hypothesis, it is not established on the next—the car stops.

It is, in my opinion, one of the great advantanges of the system never to allow the car to pass a stud that has not worked normally.

We can thus be absolutely sure that in the course of the working any defect produced will reveal itself at once, so that the remedy can be applied immediately. All tramway systems worked by contacts do not offer this security.

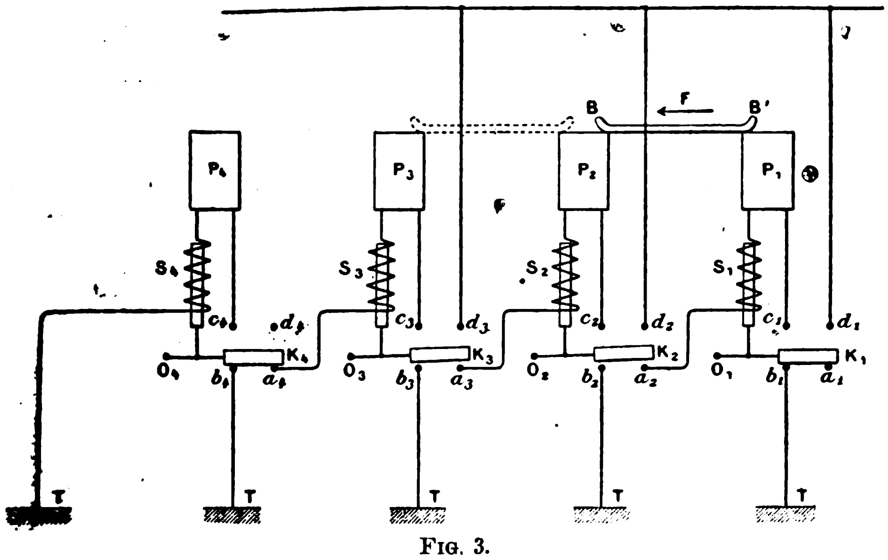

Fig. 3.

The utilization of the distributors as commutators and not as interrupters ensures, as we have already remarked, the suppression of arcs of establishment or breakage of current in the apparatus.

The result is great reliability of working as regards derivations of currents which might be produced on the line between the studs and the earth when the insulation of the contact is defective. We passed a car over some studs on which we had purposely established an artificial derivation, allowing about 80 amperes over the normal charge to pass. As the breakages of the arc took place on the contact bar, the distributing apparatus supported the overload very well.

In short, therefore, M. Vedovelli's tramway seems very interesting from the point of view of simplicity of mechanism and safety of working.

SOME NOTES ON DR. R. C. SHETTLE'S VIEW OF THE ULTIMATE NATURE OF ELECTRICITY.*

BY SPENCER L. FLETCHER.

The view taken by Dr. R. C. Shettle of the ultimate nature of electricity is briefly as follows: (1) that electricity is a substance which probably consists of ether in a state of condensation; (2) that the individual atoms of matter are surrounded with atmospheres of condensed ether, which give to them their electrical properties and power of chemical combination.

From this it would follow that a positively-charged body is one which is more densely charged with condensed ether than a neutral body, a discharge being merely the liberation of this condensed ether. The view that electrical phenomena are to be ascribed to the agency of a substance is by no means foreign or contrary to the electrical science of to-day. "Clerk Maxwell proposed a theory of the relation between electromagnet phenomena and the phenomena of light, based upon the assumption that each of these are due to certain modes of motion in the all-pervading ether of space, the phenomena of electric currents and magnets being due to streams and whirls and other bodily movements in the substance of the ether, while light is due to vibrations to and fro in it."†

In a recent text-book for the University of London, the following statements occur: "When we electrify a body we effect some change in a very imperfectly known substance called electricity, which is associated with all matter, and which can be transferred from one body to another. When bodies possess their normal amount of electricity they are neutral, and when they possess more or less than that amount the excess or deficiency is called a charge. . . . When two dissimilar bodies are rubbed together all that takes place is a transfer of electricity from one to the other, so that one acquires an excess, the other an equal deficit."‡

The view that the ether of space tends to condense upon the ultimate particles of ordinary matter is supported by no less an authority than Dr. Oliver Lodge.§ The velocity of light in glass, as proved by the experiments of Foucault, is about two-thirds of the velocity in air (186,000 miles per second). To what must this decrease in velocity be ascribed? Glass itself transmits vibrations at only a few thousand feet per second, hence we must ascribe the transmission of the light rays which traverse the glass, not to the material of the glass itself, but to the ether within it. We arrive at the conclusion that the ether which occu-

Digitized by Google

pies the interstices between the particles of the glass transmits light with only two-thirds of the velocity of light traveling in the ether of space.

From the analogy of sound, it is known that wave motion is retarded either by a decrease in the elasticity or by an increase in the density of the medium traversed. Dr. Lodge prefers the latter cause, ascribing the diminution in the velocity of light when traversing glass to a condensation of the ether within the substance of the glass itself. This means that each particle of the glass is surrounded by an atmosphere of ether which is of greater density than the ether of space. It appears that these ether atmospheres might be transferred from one particle to another according to much the same laws as those which govern the production of electric charges by friction. The source of electrification appears to be really contact of dissimilar substances, that is, substances which have a natural difference of potential, the motion of one substance over the other merely serving to renew the surfaces in contact.

By the natural potential of a substance is to be understood (according to the views stated at the head of this paper) the pressure of its contained ether. This will depend upon the tendency of the individual atoms of the substance to condense the ether of space around them, and this will presumably be different for the atoms of the different elements. Thus, if two *different* substances were brought into close contact so that their ethereal atmospheres might coalesce, it seems quite conceivable that after separation their charges of "bound ether" should be found to be shared in a proportion differing from that in which they existed before contact. One would lose exactly what the other gained, and thus positive and negative charges (representing excess and deficiency of electricity) would be produced in equal amounts. If the two substances were identical in every way, the affinities of their particles for ether would be equal, and there would be no tendency during contact for an *unequal* distribution of the ether charges. Hence, with two substances which are identically the same, no electrification results from bringing them into contact. This is exactly in accord with experiment.

If we conceive the ether atmospheres of the atoms to be endowed with any property resembling surface tension, it is possible to form a theory of chemical combination. For if two atoms were brought so near together that their ether atmospheres touched, these would coalesce like two drops of water, and since the ether atmospheres are attached to the atoms the two would be held togther. In cases where the atomic atmospheres were large, the interstices of a molecule formed of such atoms would be completely filled with condensed ether, and a superabundance would accumulate outside. Such a molecule, or a mass of such molecules, would, according to the above views, be positively electrified, i.e., in a condition to communicate electricity (condensed ether) to a neutral body. Should this be a metallic wire, the excess of ether of the positive body would coalesce with the ether envelopes of the atoms of the wire at the point of contact, and from these pass on to others, thus establishing an actual flow of condensed ether along the wire until its potential and that of the original body were equalized.

Conversely, the constitution of a negative body would be such that its atomic interspaces were only partially filled with condensed ether. The atoms would have small envelopes, which would coalesce only at the points of contact with one another, leaving interspaces between. (Note.—It would at first appear that a positive body which is completely saturated with condensed ether would necessarily lose its cohesive property, because when the atomic interspaces were full, there would be no "capillary" surfaces of condensed ether to exert tension between the atoms. The conception of ethereal atomic envelopes possessing surface tension implies, however, that the condensed ether has an affinity for itself as well as for the atoms of matter, and this, upon the present hypothesis, is the ultimate force which holds the particles of a mass together.) The layer of condensed ether upon the surfaces of the atoms cannot be infinitely thin, or the amount condensed within a mass of glass would not sufficiently fill the interspaces in which the light travels to seriously affect its velocity. And since refraction (which is due to the retardation of the ray on entering the denser medium) takes place even in the upper regions of the atmosphere, it appears that the ether envelopes must fill a portion of the atomic and molecular interspaces, which is by no means negligible even in a rarefied gas.

Let us trace upon these hypotheses the action of an electrolytic cell containing, say, a solution of sodium chloride (NaCl). In a dilute solution, the ions, Na and Cl, it is now believed, are traveling about separately in the liquid, the Na endowed with a positive, the Cl with a negative electric charge. In other words, the Na is associated with an excess, the Cl with a deficiency of condensed ether. The two electrodes are also positive and negative in the same way. When an atom of Na, with its excess of "bound ether," comes into contact with the negative electrode, there is a transference of ether from the Na to the electrode. When an atom of Cl which is negative or deficient in ether comes in contact with the positive electrode which contains an excess, there is a transference of ether from the electrode to the Cl. Thus electricity enters the liquid by the positive and leaves it by the negative electrode. The ions appear only in the near neighborhood of the electrodes, for until discharged by contact with them they appear to be chemically inert. The action of a voltaic or primary cell may be explained in a similar manner. When dry zinc and copper are brought together in air, the zinc is relatively positive, and electricity flows from zinc to copper. If, however, the zinc and copper are partially immersed in a dilute acid and contact is made, the zinc is relatively negative, and the current flows (above the liquid) from copper to zinc. It appears that of two metals dipped into a corrosive liquid, that one becomes negative which is more easily corroded. Let the exciting liquid be dilute H_2SO_4; of this, the H is positive, the SO_4 group negative (as proved by their going respectively to the negative and positive electrodes in electrolysis). The SO_4 combines with the zinc, forming zinc sulphate, which dissolves in the liquid; hence positive zinc atoms are continually being subtracted from the zinc plate. Meanwhile the positive hydrogen atoms discharge their excess of ether into the copper plate; and thus a current is kept up along the external circuit from copper to zinc. In the case of contact of the dry metals, ether is transferred from copper to zinc, because the atoms of the positive zinc have the larger ethereal envelopes, the inter-atomic interstices of the zinc are quite full, and an excess of condensed ether resides upon the surface of mass.

The ether envelope theory also explains to some extent why transparent solids are non-conductors and conducting solids are opaque to light. In metals the condensed ether, or at least a portion of it, appears to be capable of flowing from atom to atom within the mass of the substance, maintaining a uniform pressure throughout like a gas dissolved in a liquid. This would seem inconsistent with the rigidity necessary for the transmission of the transverse vibrations of light. In glass, on the other hand, the condensed ether appears to possess this rigidity, to be more rigidly attached to the atoms and less mobile. Hence glass does not conduct. Water, if quite pure, behaves like glass—transmits light, but not electricity. To render it a conductor, a catalytic agent must be present, as a few drops of acid. Even then the transfer of condensed ether through the liquid is only accomplished by means of actual movements of the atoms. It is not real conduction, but electrolytic convection. It thus appears that the condensed ether is an opaque conductor, such as copper, possesses a certain amount of mobility, while in a transparent insulator, such as glass, it is more rigid and resembles a jelly.

THE TEACHING OF MATHEMATICS.

In a recent number of "Nature," London, there appeared an excellent article by Prof. Perry on the above subject, of which the following is an abstract:

I think it very important to try to get a view of our system of teaching mathematics which is not too much tinted with the pleasant memories of one's youth. Like all the men who arrogate to themselves the right to preach on this subject, I was in my youth a keen geometrician, loving Euclid and abstract reasoning. But I have taught mathematics to the average boy at a public school, and this has enabled me to get a new view. I have seen faces bright outside my room become covered as with a thin film of dullness as they entered; I have known men, the best of their year in England in classics, lose in half an hour—as men did in the first day of slavery in old times —half their feeling of manhood; and I have known that, as an orthodox teacher of mathematics, I was really doing my best to destroy young souls. Happily, our English boys instinctively take to athletics as a remedy, and I know of nothing which gives greater proof of the inherent strength, in good instincts and common sense, of our race than this refusal to allow one's soul to be utterly destroyed.

I have also mixed much with engineers, who really need some mathematics in their daily work, men who say that they once were taught mathematics, and I know that these men never use anything more advanced than arithmetic, and actually loathe a mathematical expression when it intrudes itself into a paper read before an engineering society. Of all branches of engineering, electrical engineering relies most upon exact calculation. Well, the average electrical engineer in good practice would rather work a week at many separate arithmetical examples than try for an hour to get out the simple algebraic expression, which includes all his week's results and much more. Yet he has passed perhaps certain rather advanced examinations in mathematics. Furthermore, those engineers who can most readily apply mathematics to engineering problems

Digitized by Google

almost invariably descend to the position of teachers and professors in schools and colleges, and they seem to lose touch completely with the actual life of their profession. I have studied these phenomena very carefully, and I affirm that they are directly traceable to the absurd thing called mathematical teaching in schools and colleges.

I do not mind retaining the buttons at the back of my coat; many useless ancient ceremonies may still be practiced, and I shall not object. I can even admire them, but the unscientific waste of the valuable youth of millions of our people, now that we are face to face with nations who evidently appear to be determined to destroy England through commerce and war, is so abhorrent to me that I cannot think of it with patience. It is not merely in arithmetic and geometry, but in the higher parts of mathematics that this waste goes on. Newton employed geometrical conics in his astronomical studies, and mechanics was developed; and therefore it is that every young engineer must study mechanics through astronomy, and he dare not think of the differential calculus till he has finished geometrical conics. The young applier of physics, the engineer, needs a teaching of mathematics, which will make his mathematical knowledge part of his mental machinery, which he shall use as readily and certainly as a bird uses its wings; and we teach him in such a way that he hates the sight of a mathematical symbol all his life after.

Great expectations are entertained and many plans are being formed in Porto Rico for the installation of short inland electric railways from the central range to the coast. The power is to be developed through the agency of many streams to be met with in every part of the mountain range which traverses the island from end to end. If all that is expected in the way of new roads and other electrical works is accomplished there will be a field in Porto Rico for considerable electrical machinery and material. The only road on the island, from the capital to Rio Padres, some nine miles in length, is shortly to be equipped electrically.

Success of the Electric Kitchen at the Paris Exposition.

The electric kitchen at the Paris Exposition seems to have settled all controversy regarding electricity as an economical and desirable method of cooking. The electric kitchen is probably the most elaborate affair of its kind ever installed. Between 300 and 400 guests are cared for daily, the cooking giving entire satisfaction. The mean consumption of electricity per guest amounts to about six cents, thus enabling the concessionaire to charge about the same amount for food as the average exposition restaurant price.

The electrically heated apparatus used is mixed with various proportions of non-conducting enamel, thus making blocks of high resistance material, well adopted to developing heat under the application of electric current. The restaurant kitchen is furnished with a great oven, four by seven feet, provided with eight heaters, which can be carried up to a temperature of 1,200 degrees centigrade. The heat not used for cooking is utilized to keep plates hot at odd times and for other purposes. There is also installed a roasting oven, which is capable of broiling meats with heat from red hot plates. Water boilers, soup kettles, etc., are installed, and smaller articles, such as coffee pots, tea pots, etc., are heated on small hot plates.

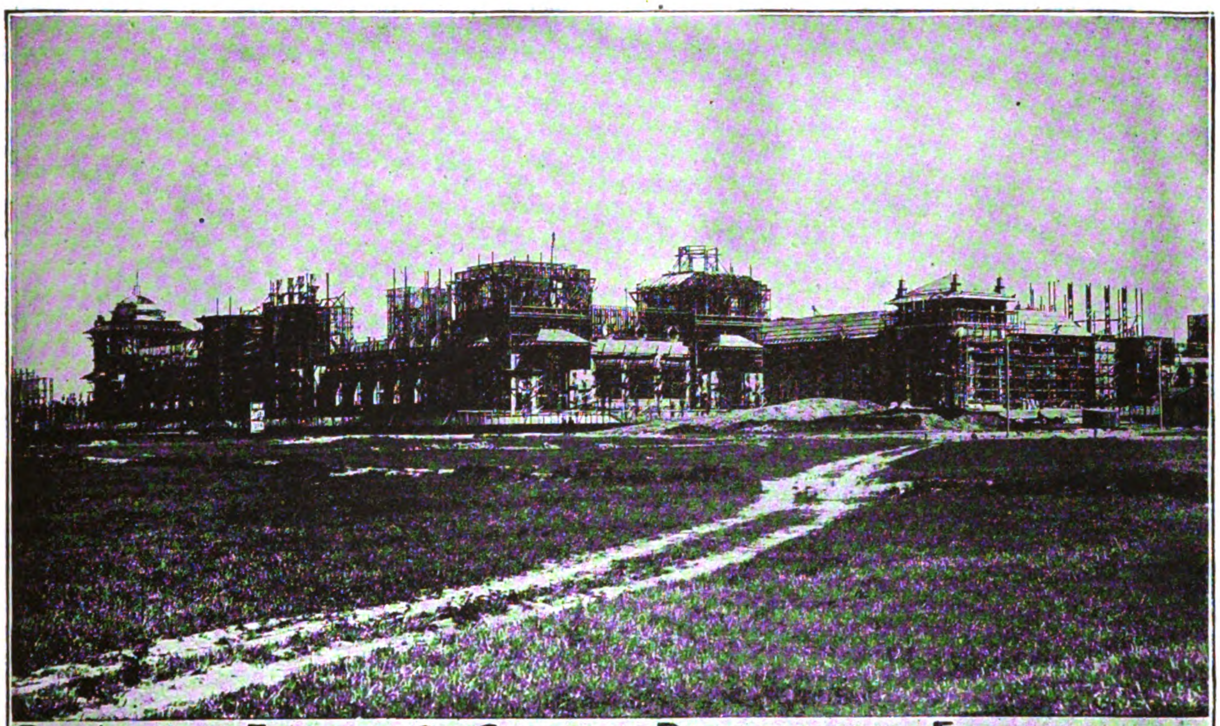
The main advantage of the electric kitchen is the rapidity with which food can be cooked, and the absence of smoke and all possible danger of fire. Now that electricity as a cooking force has been proved practicable, doubtless the electric kitchen will play an important part in saving the time and temper of those who wait on slow fires, and in promoting public health and happiness by insuring well cooked and easily digested food.

WORK ON THE PAN-AMERICAN EXPOSITION BUILDINGS.

The accompanying views give some idea of the progress of work upon the buildings for the Pan-American Exposition to be held in Buffalo next year. One of these shows the Electricity and Machinery buildings, looking southeast from that portion of the grounds which will be occupied by the Midway. The view does not clearly distinguish between the two buildings, but they are in reality separated by one of the main thoroughfares of the Exposition known as the Mall, 150 feet wide, which runs east and west. The other shows a nearer view of the Electricity Building looking up at the southeast corner. The point of view is near the base of the Electric Tower, the first lengths of the steel frame work of which are now being put in place and which will ultimately reach skyward 375 feet.

All of the large buildings of the Exposition are well under way. These include, besides those here represented, the Agriculture Building, Manufactures and Liberal Arts Building, Graphic Arts, Forestry and Mines, Horticulture, the large group of three Government Buildings, Temple of Music, Ethnology Building, Stadium, Midway entrances and concession buildings, New York State Building and the Albright Gallery of Art. The Service Building, which is the administrative headquarters of the Exposition, was completed early last fall.

By reference to the illustrations here given it will be seen that workmen are already putting on the gleaming white staff with which all the buildings are to be covered. The staff is prepared in an endless variety of forms, including elaborate statuary, large cartouches and medallions, rich columns, consoles and brackets, soffits and pilasters in relief, and all sorts of architectural ornaments of intricate detail. All the exteriors of the buildings are to be finished in color, presenting a most agreeable effect upon the eye. It is said of this Ex-



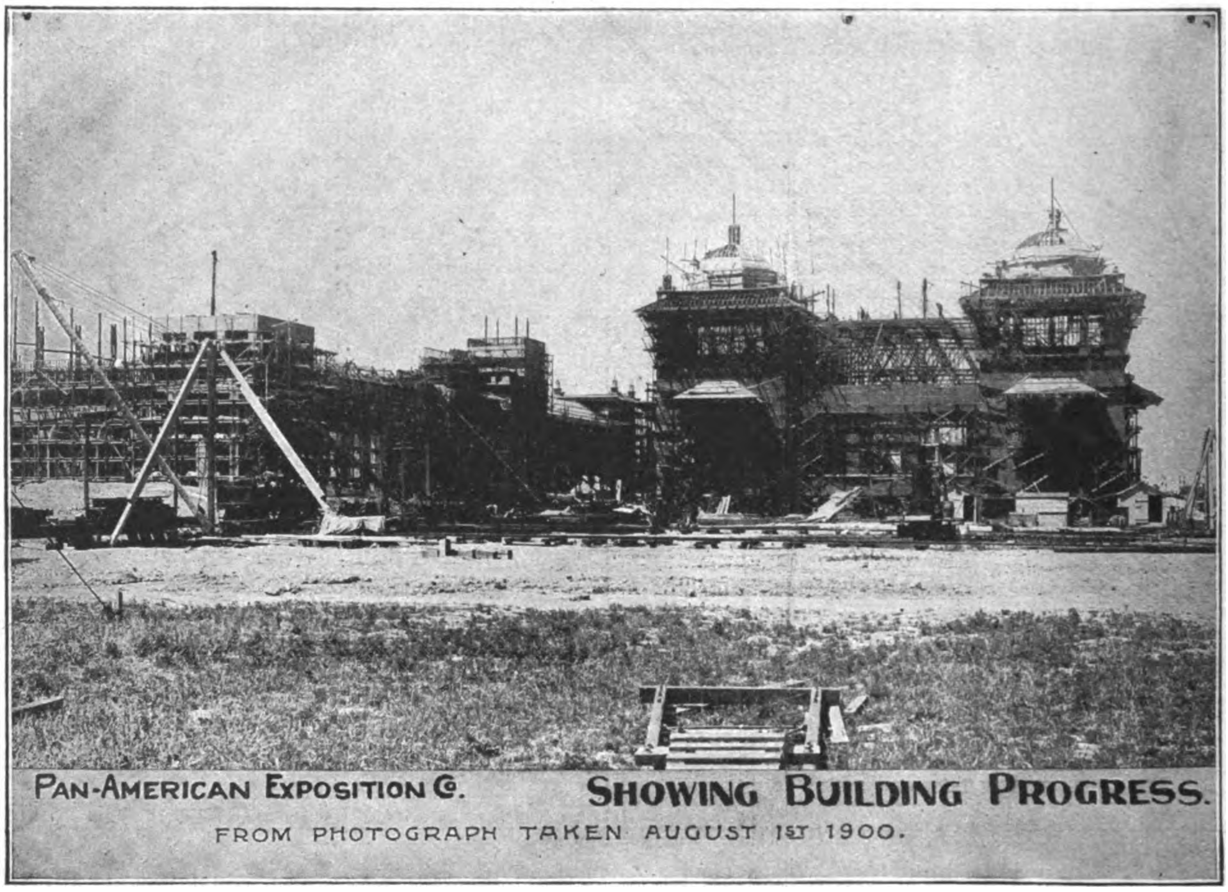
PAN-AMERICAN EXPOSITION Co. SHOWING PROGRESS ON ELECTRICITY AND MACHINERY AND TRANSPORTATION B'LDG'S

Digitized by Google

position that it will surpass all former expositions in the extent and variety of its sculpture and plastic decoration. It will also outrival its predecessors in the beauty and completeness of its horicultural and floral effects, and is to have the most elaborate and picturesque presentation of electrical effects ever undertaken. The arrangement of the buildings is a symmetrical one, nearly all of the principal structures being grouped about broad courts. About 33 acres of land are comprised in these courts, all of which will receive this elaborate embellishment. Large pools with a bewildering number of fountains and jets of water will complete the picture, and at night the rippling surfaces of water will be made particularly brilliant by means of floating lights and the wonderful illumination of all surrounding objects by the use of more than 200,000 electric lamps.

The installation of the heavier exhibits is to begin early in November, and the contracts require that all of the principal buildings shall be completed before severe weather sets in. Thus is the public assured that the Exposition will be opened on time and that the early comer will have quite as much to see as those who delay their visit.

The process of building a great Exposition has a charm to every one who has an interest in the development of any grand enterprise. It represents a vast organization, with its director-general and assistant directors, superintendents, contractors, care-takers, foremen and an army of workmen under the discipline necessary to carry on rapidly and successfully a great work. Materials are being brought into the grounds by train loads almost every day, and each week shows definite progress. The illustrations here given show what has been accomplished on the buildings in about three months. Another three months will find several of them completed and all of them so well progressed that the rigorous weather of winter cannot interfere with their prompt completion.



EDISON'S LATEST.

He Plans to Make Electricity from Coal and to Abolish Dynamos.

(From the New York Morning Journal, Aug. 31.)

Thomas A. Edison, the electrical wizard of the century, is reported to be almost ready to make public details of his newest invention. It is a machine for the generation of electrical power without the use of engines and dynamos.

This new invention is said to approximate almost exactly the production of electricity directly from coal. If the machine is a success its effect upon all methods of propulsion will be incalculable.

Edison himself said six years ago that such an invention would be the greatest possible step in the advancement of electricity. In an interview published October 28, 1894, he authorized this statement:

"The discovery of a way of converting coal directly into electricity will be the turning point of all our methods of propulsion. Steam will be entirely superseded by the current. There will be no boilers nor any of the necessary externals which go with steam engines.

"We are rapidly approaching the time of the steam engine's end. The large Atlantic liners are slowly reducing their time on their trips, but that must soon stop. Then we shall have to wait until coal is turned directly into electricity. I believe it will come, and then we will cross the Atlantic in four days or less. We can get 90 per cent of the efficiency of a dynamo, against 6 or 10 per cent. of an engine."

IT WAS EDISON'S DREAM.

This was Edison's dream in 1894. His vision seems to have become a reality.

William Phillips Hall, president of the Hall Signal Company and for years an experienced electrician, said yesterday:

"As I understand it, Edison's new scheme is the nearest approach yet to the generation of electricity directly from coal. The invention will be of vast importance to every field in which electricity is now used."

The new plan is expected to revolutionize the use of electricity in homes, in offices and in self-moving vehicles of all descriptions. It will make it possible for private electric lighting plants to be maintained in houses with but small expense. It will make it possible to store current in batteries of automobiles without the expensive necessity of carrying them to a city or electrical plant.

TO DO AWAY WITH DYNAMOS.

In the new arrangement a simple, portable and inexpensive machine, it is understood, will take the place of the commonly used dynamo. An oil stove is to supplant the steam engine. The exact construction of the new machine is still kept secret, but the principle of its operation was yesterday made known to the "Journal" by a man close to Edison and to whom had been explained the method of construction and operation of the invention.

The principle of the machine is the very simple one that cold contracts and heat expands any substance. In this machine a combination of metal—a combination the result of years of study and experimentation—is to be heated by a small stove.

The metals are said to be so arranged and combined that the heating of them starts in motion an electrical current which can be communicated immediately to a storage battery.

Digitized by Google

STEAM A GREAT EXPENSE.

Ever since electricity began to be generally used the expense of purchase and operation of a steam engine and dynamo has barred it from the use of any one not possessing considerable money. To build an electric lighting plant in a small city has always been the origin of a burdensome debt.

The inconvenience of transporting storage batteries, sending them back and forth for charging, has practically deprived rural sections of the world of the use of electricity. Phonographs, automobiles, electric launches electric lighting plants, etc., could be used by only the wealthy.

Edison's new scheme is expected to revolutionize all of this. Where automobiles are now used by tens they will probably soon be used by hundreds, or even thousands. The phonograph industry will probably take a tremendous bound and elaborate electric illuminating plants can be maintained inexpensively in the remotest rural districts.

Although Edison has been at work upon his new invention at his Orange, N. J., laboratory, for nearly three years, every suspicion of his plans has been kept from the public. Only a very few were admitted into the secret, and they were pledged.

HIS PERPLEXING PROBLEM.

The problem that Edison had to face was this:

How can the greatest amount of electrical current be generated by the minimum amount of coal? How can the enormous heat lost in heating a steam boiler, the steam lost in moving the engine propeller and the power lost by friction of the engine and dynamo wheels, be conserved, and the current dispatched immediately into the storage battery?

No steam engine on land had ever been able to get more than one-horse power per hour for less than two-pounds and a half of coal, and by the time this power had reached the dynamo it was decreased, and still more so by the time the battery was reached.

Now that Edison is reported to have solved the question and is said to have made it all so simple that it seems like a sleight-of-hand trick laid bare, a company has been organized to put the machine on the market. This company has incorporated itself under the laws of New Jersey. This machine may prove to be practically useful in generating electricity upon a large scale.

In the one matter of storage batteries alone, the possibility of storing them directly from a machine with no dynamo will cause to jump upward an industry which has increased enormously within the last five years.

A Philadelphia concern, which has recently sent a statement to stockholders, sold $227,000 worth of batteries in 1895, $456,000 in 1896, $1,046,000 in 1898 and $3,500,000 in 1899, while during the first six months of the present year sales were greater than during the whole of last year. Edison's new invention, if practicable, will probably make the use of storage batteries almost universal.

It is understood to be the intention of the promoters of the scheme to announce the new invention about September 15.

"Pan-American Express"

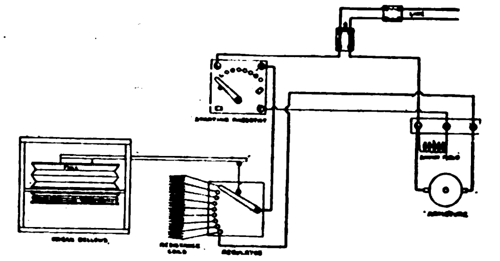
The "Pan-American Express" train of the New York Central was put in service in both directions between New York and Buffalo on Sunday, May 7, 1899, and was so named in honor of the great Pan-American Exposition to be held in Buffalo in 1901.

The main object of this train is to furnish the best possible night service between New York and Buffalo, Rochester, Syracuse, Niagara Falls and Toronto, the leaving time at either end of the line having been so arranged as to permit patrons to dine leisurely at home, or at their hotel, and have ample time to make the train and arrive in New York or Buffalo in time for breakfast at the usual hour and before the business of the day begins.

The equipment of the "Pan-American Express" train is composed of the most modern coaches and sleeping cars, built by the Pullman Company at their works in Buffalo especially for this service, and are of the strongest possible construction, combined with an ease of motion that makes the trip a positive pleasure to travelers.

Electrically Operated Church Organs.

The blowing apparatus of church organs when operated by a Lundell electric motor is regular and reliable in its service—two very important features required for organ music. It is exasperating to have the bellows suddenly give out or work with uneven pressure. With a Lundell motor outfit this does not happen, because the organ is under the absolute control of the organist. The motor is always ready for service, it never goes to sleep and does not require a vacation. The organist knowing the reliability of the instrument is



WIRING DIAGRAM FOR CHURCH ORGAN.

not nervous and can put more soul into his music; the church committee can be comfortable in the realization of its endeavors and the organ manufacturer knows to a certainty that mechanically the instrument will have the best opportunity to demonstrate its value.

The Lundell motor outfit is connected directly to the wheel, handle or shaft of the bellows, thus doing away with expensive and troublesome belting, shafting and all other cumbersome accessories which, of necessity, have heretofore been used in conjunction with electric, hydraulic and gas engine organ blowing outfits. Obviously there are no pipes to freeze, no smoke or odor, no increase or insurance risk, no noise and no continual repairs.

A turn of the switch puts the apparatus in motion, and an automatic regulator controls the speed in exact proportion to the amount of wind called for by the organist. Under average playing conditions the motor maintains almost a constant speed, keeping the bellows nearly full. When the entire resources of the organ are drawn upon, the motor quickly speeds up, giving the maximum supply of wind. If the player suddenly stops or plays pianissimo, the motor immediatly responds and its speed is decreased so that the bellows is not overblown. The outfit completely controls the wind supply under all conditions.

The starting switch can be placed wherever desired, usually where accessible to the organist. The motor is started or stopped with this switch and the regulator automatically takes care of the speed of the motor.

The regulator, should be placed so that the lever arm can be connected by cord or flexible wire to the lever or top of the bellows. The point at which this cord is attached should have the proper amount of movement between empty and full bellows, so that the controller arm will make its full movement during this period.

For small reed or pipe organs the outfit may be enclosed in a neat case and set at the side or back of the instrument. With large organs, the motor is placed wherever most convenient for connection to the direct acting bellows or the supplementary bellows.

CANADIAN NOTES.

(From our Ottawa Correspondent.)

The Brandon Electric Light Company of Brandon, Manitoba, has been given authority to increase its capital from $50,000 to $125,000.

The city council of Kingston, Ont., will take steps to acquire the electric light plant of the Kingston Light, Heat & Power Company, or in the alternative to install a new electric light plant.

The town of Morrisburg, Ont., is inviting tenders for the erection of an electric lighting and power plant to include three distinct sections—hydraulic development and building, water wheels and steam works, and electric plant.

The question of municipal ownership of electric lights and street railways was a subject that received earnest consideration at the recent meeting of the Board of Trade for the Maritime Provinces of Canada. A resolution, to the effect that cities and towns should guard with great care their franchise for street lighting and railways, and retaining the same under control for cheaper consummation, thus averting the high charges of private corporations, was unanimously passed.

The Capital Power Company of Ottawa has been formed to take over and develop the Conroy electric plant at Deschenes Rapids, a few miles from Ottawa. This plant already brings in $33,000 yearly revenue and the expense of operating it is only $9,000 per annum at present. The company's new power house at Deschenes is furnished with modern turbines, made by the Triumph Manufacturing Company of Springfield, Ohio. The flumes are made of concrete and the buildings are fireproof, the whole being a good example of a modern, up-to-date power house.

While the development of water powers in electrical operations is one of the characteristic features of the day, the development of electrical energy on the Canad an side of Niagara Falls seems to be no further advanced than it was ten years ago. Whatever deals that the Ontario Government have lately made with electrical companies, they appear to have had the effect of only tying up the work of develment instead of promoting it. Last year the Government rescinded the monopoly of the United States Company, which heretofore held the franchise, and made provision whereby companies could obtain rights to develop electrical power at the Canadian falls. More than a year and a half have elapsed without any substantial progress being made, and there is little indication of development work being undertaken in the near future.

AMERICAN STREET RAILWAY ASSOCIATION CONVENTION.

Secretary Penington desires ELECTRICITY to state that the nineteenth annual meeting of the American Street Railway Association will be held at Convention Hall, Kansas City, Mo., October 16, 17, 18 and 19. Papers will be read on the following subjects:

"Double Truck Cars; How to Equip Them to Obtain Maximum Efficiency Under Varying Conditions."

"Comparisons of the Various Systems of Electrical Distribution for Street Railways."

"Consolidation of Street Railways and Its Effect Upon the Public."

"The Store Room and Store Room Accounts."

"Painting, Repainting and Maintenance of Car Bodies."

Friday, October 19, has been set apart as a day for the examination of the exhibits. No session of the Association will be held, so that all may have plenty of time to view the exhibits. It is earnestly requested that managers have their heads of departments present on that day.

The annual banquet will be held at the Coates House Friday evening, when the officers-elect will be installed.

The headquarters of the Association will be at the Midland Hotel.

The following are the hotels and rates: Midland, American plan, $3 to $6 per day; European, $1 to $5; New Coates, American, $3 per day and up; European, $1; Savoy, American, $2.50 to $6 per day; European, $1.50 to $3.50; Baltimore, American, $3 to $5 per day; European, $1.50 to $3.

The executive committee advises all who desire rooms to apply at once.

The Passenger Associations have granted a rate of one and one-third fare, on the certificate plan, provided one hundred or more tickets are purchased. Be sure and get a certificate when you purchase your ticket and deposit the same with clerk upon your arrival at the hall. He will have it signed and ready to be returned to you on Thursday, October 18. You cannot get return ticket at reduced rate if you fail to get certificate when you purchase your ticket.

Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended September 1:

Alexandria, 3 cases, $150; Antwerp, 32 packages, $6,695; Argentine Republic, 76 cases, $1,813; Barcelona, 1 case, $46; Bath, 1 case, $110; Brazil, 48 packages, $3,140; Bremen, 1 case, $24; Bristol, 32 cases, $5,000; British East Indies, 19 cases, $894; British Possessions in Africa, 9 cases, $1,425; 107 packages, $13,101; British West Indies, 19 cases, $80; Central America, 84 cases, $1,417; Chili, 3 cases, $316; Cologne, 7 cases, $525; Cuba, 65 cases, $1,698; Ecuador, 2 cases, $26; Glasgow, 13,144 packages, $70,924; 6 packages motors, $200; 2 electric launches, $1,000; 56 reels electric cable, $19,951; Havre, 258 cases, $25,447; 1 box motors, $40; Hull 14 packages, $850; Japan, 9 cases, $737; Liverpool, 50 packages, $7,700; 80 cases, $6,354; 16 packages motors, $3,300; 2 packages electros, $166; 12 packages motor trucks, $1,386; 4 cases automobiles, $900; London, 301 cases, $11,608; 15 cases motors, $2,987; 1 case electros, $14; 4 cases motor cars, $250; Manchester, 56 packages, $7,685; Mexico, 136 packages, $7,912; 17 cases electric vehicles, $3,718; 36 cases electric motors, $6,216; Newcastle, 35 boxes, $4,700; Peru, 11 packages, $678; Porto Rico, 124 packages, $542; Preston, 24 packages motor trucks, $1,386; Reval, 39 cases electric motors, $6,993; Southampton, 37 packages, $3,333; St. Petersburg, 34 packages, $1,200; Trieste, 1 box, $51; U. S. Colombia, 20 cases, $490; Venezuela, 1 case, $12.

Estimate Wanted.

A storage battery to convey power for 24 hours and which can be easily recharged and give at least 25 pounds power; size to be 4 inches wide, 8 inches high and 4 inches deep; also a motor of light construction and not any wider than 2¼ inches. If any manufacturer has either the one or the other or both address with full particulars Arthur B. Jennings, care Oscar A. Michel, registered patent solicitor, Room 1204, No. 302 Broadway, New York City.

COMING ELECTRICAL EVENTS.

American Electro Therapeutic Association—Will meet in New York City Sept. 25-27, 1900.

American Street Railway Association—Will meet in Kansas City, Mo., Oct. 16-19, 1900.

National Association of Municipal Electricians—Will meet in Pittsburg, Pa., Sept. 25-27, 1900.

Old-Time Telegraphers' Association and the U. S Military Telegraph Corps—Will meet in Minneapolis, Minn., Sept. 18, 1900.

Roentgen Society of the United States—Will meet in New York City Dec. 13-14, 1900.

Street Railway Association of the State of New York—Will meet at Buffalo Sept. 18-19, 1900.

INCORPORATIONS.

The Covina Electric Company, Covina, Cal. Capital stock, $25,000. Incorporators: T. B. Thomas, H. M. Houser, O. Anderson and I. D. Houser.

The Barker-Moyer Company, New York City—to do electrical contracting. Capital stock, $10,000. Directors: W. A. Barker of Newark, N. J., C. O. Moyer and W. B. Dewey, Jr., of New York City.

The Manti Light & Power Company, Manti, Utah—to generate electricity and to operate dynamos for the purpose of propelling machinery and furnishing light and power to Manti and adjoining cities. Capital stock, $15,000. Officers: James Crawford, Jr., president; John H. Houggaard, vice-president; W. C. Snow, secretary and treasurer.

The Mountain State Electrical Company, Wheeling, W. Va. Capital stock, $50,000. Incorporators: Frank B. Hall, Harry F. B. McLain, John F. Trasher and Alfred D. Hall, of Wheeling, and Fred. B. Jones, of Martin's Ferry.

The United States Fender Company, Camden, N. J. Capital stock, $100,000. Incorporators: J Willard Morgan, William J. Browning and W. T. Weiss, all of Camden. Mr. Weiss is the master mechanic of the Camden & Suburban Railway Company and the inventor of the fender which is to be used on the Camden cars.

The York Furnace Electric Company, Lancaster, Pa.—to own and control water power from the Susquehanna River and develop and distribute electric current for heat, light and power. Capital stock, $1,200. Directors: F. S. Shoff, Colemanville; John W. Holman, Newton; J. Miller, G. B. Wilson and W. F. Beyer of Lancaster.

COMMERCIAL PARAGRAPH.

The American Electric Telephone Company, 36 West Jackson Boulevard, Chicago, is now handling a new device known as the Burns Individual Station Metallic Circuit Protector, which is a combination lightning arrester and sneak-current protector, the use of which affords absolute protection to a telephone switchboard. The efficiency of the "heat coil" does not depend on a fusing of the wire in the coil; it is rendered operative by the heating action of the current on a hard rubber rod which is the core of the coil, which causes it to bend sufficiently to release itself at one end and jump out of the retaining clip before the sneak-current has had time to fuse the wire or do any damage to the switchboard.

ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U. S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

LETTERS PATENT ISSUED AUGUST 28, 1900.

ELECTRIC RAILWAYS AND APPLIANCES.

656,790. Trolley. Morris T. Schaffer, Bethlehem, Pa., assignor of one-half to Edwin J. Lichtenwalner, Allentown, Pa. Filed May 4, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

656,840. Protector for Electric Lamps. Frank B. Garretson, Worcester, Mass., assignor to himself and William J. Gindele, same place. Filed March 8, 1900.

657,020. Portable Electric Lamp. Franklin W. Brooks, Washington, D. C. Filed June 9, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

656,716. Fluid-Operated Electric Switch. Charles A. Eck, Newark, N. J., assignor to the Auto-Electric Air Pump Company, New York City. Filed Feb. 12, 1900.

656,744. Device for Lighting Lamps by Electricity. Svend M. Meyer, New York City. Filed March 3, 1898.

656,806. Alternating Current Generator. Charles S. Bradley, Avon, N. Y., assignor to the General Electric Company of New York. Filed June 22, 1896. Renewed May 11, 1900.

656,870 Electric Switch. Reinhold H. Wappler, New York City, assignor to the Wappler Electric Controller Company, same place. Filed Dec. 8, 1899.

656,972. Electric Motor. Edward A. Henry, Crestline, Kan., assignor to Edward A. Henry and J. Lewis Griswold, same place. Filed March 21, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

656,703. Telephone System. Frank G. Rugh, Briar Bluff, Ill., assignor of one-fourth to Wilson W. Adams, Atkinson, Ill. Filed June 28, 1899.

656,907. Telephone Signaling Appliance for Party Telephone Lines. Josef Steiner and William H. Tuck, New York City, assignors to the Western Electric Company, Chicago, Ill. Filed Jan. 8, 1900.

656,996. Supervisory Signal for Telephone-Switchboards. Frank R. McBerty, Evanston, Ill., assignor to the Western Electric Company, Chicago, Ill. Filed July 25, 1898.

656,997. Signal for Telephone Trunk Lines. Frank R. McBerty, Evanston, Ill., assignor to the Western Electric Company, Chicago, Ill. Filed Jan. 29, 1900.

MISCELLANEOUS.

656,635-656,636. Electric-Motor Suspension. George Gibbs, Philadelphia, Pa. Filed Feb. 28, 1898, May 11, 1900

656,650. System of Electrical Distribution. Alexander D. Lunt, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed June 30, 1900.

656,652. Carbon Brush. William A Markey, Saginaw, Mich., assignor to Emmet T. Bowen. Filed March 30, 1900.

656,680. System of Electrical Distribution. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed June 12, 1899.

656,700. Battery-Box. Leon W. Pullen, Camden, N. J., assignor to the Pullen Battery & Electrical Manufacturing Company of New Jersey. Filed Sept. 16, 1899.

656,780. Lightning-Arrester. William E. Athearn, New York City. Filed Feb. 16, 1898.

656,796. Signal-Receiving Relay. George K. Thompson, Malden, and Ernest C. Robes, Medford, Mass., assignors to the American Bell Telephone Company, Boston, Mass. Filed March 12, 1900.

656,808. Lock. Henry G. Carleton, New York City, assignor to the Carleton Electric Company, same place. Filed Feb. 10, 1900.

656,821. Means for Controlling Energy Delivered to Electrical Translating Devices. Harry W. Leonard, New York City. Original application filed Jan. 31, 1896. Divided and this application filed Jan 13, 1900.

656,828. Telautographic Apparatus, Foster Ritchie, London, England Filed Jan. 29, 1900.

656,832. Telegraphy. Henry D. Bartholomew Newark, O. Filed Oct. 12, 1899.

656,882. Charging-Stand and Contact for Storage Batteries. George H. Condict, New York City, assignor to the Electric Vehicle Company, same place. Filed July 18, 1898.

656,930. Electric Furnace. Wilhelm Borchers, Aix-la-Chapelle, Germany. Filed April 12, 1900.

656,957. Electric Signaling Apparatus. Edward B. Ellicott and Louis E Oehring, Chicago, Ill., assignors to the Western Electric Company, same place. Filed May 2, 1899.

956,961. Means for Securing Pole-Pieces. Henry Geisenhoner, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Oct. 6, 1898.

656,977. Electric Lamp for Miners' Use. Leo Horwitz, Berlin, Germany. Filed Feb. 21, 1899.

656,982 Electrolytically Treating Scrap Tin. Edward D. Kendall New York City. Filed Nov. 20, 1899.

657,012. Apparatus for Electrolysis. Paul Schoop, Wildegg, Switzerland. Filed Aug. 17, 1899.

657,032. Apparatus for Electrolyzing Ores. Albion M. Rouse, Denver, Col., assignor of one-half to William G. Shedd and Frank Brooks, same place. Filed Nov. 1, 1899.

DESIGN.

33,131. Battery-Cell. David H. Darling, Jr., Rye, N. Y., assignor to the United States Battery Company, New York City. Filed July 19, 1900. Term of patent 14 years.

Digitized by Google

THE TELEPHONE WORLD.

Racine's New Telephone Company.

Articles of incorporation for the Citizens' Telephone Company were filed at the register of deeds office a short time ago. The incorporators are Frank L. Bliss, Charles R. Carpenter and John B. Simmons. The capital stock is $125,000, and the objects of the company are to operate and conduct the telephone business of Racine.

The system will be operated under the franchise granted to Allen Shewmon in October, 1899. This franchise provides that the city of Racine shall receive free telephones and that wires shall be placed underground on all of the leading streets of the city. Mr. Bills, who has been in Racine for some weeks soliciting subscriptions, says that he has 180 and that of $60,000 stock wanted $40,000 has been pledged. All of the stock is and will be owned exclusively by Racine people. Work of construction will be commenced about September 15. Arrangements have been perfected for lo g distance 'phones to the north and south and a considerable territory in the west.

It is expected that the new company, being entirely made up of Racine people, will seriously cut into the business of the Wisconsin Telephone Company. Recently the Wisconsin people made a canvass of the city and now have 1,000 'phones in operation. They are just completing a new station where it is proposed to put in one of the latest switchboards, but it will be over one year before the new quarters are occupied.

A conference between E. M. Prindle of Providence, R. I., and Judge A. Van Wagenen, of the Clark Automatic Switchboard Company's directorate, and E. A. Clark and John Van Wagenen was held recently in Sioux City, Ia. Mr. Prindle is general manager for the switchboard company, and went to Sioux City especially to meet the men of that city. "We are consulting regarding mechanical features of the business," said Mr. Prindle. "We have orders for more than 4,000 'phones, and we have just placed our first factory order for 1,000 of this number." Of this new switchboard company, which has been organized with a capitalization of $1,500,000, William B. Branigan, of Providence, is president.

The Southern Indiana Telephone Association was organized at Huntingburg recently and the following officers elected: G. A. Kienley, Huntingburg, president; C. D. Knoefel, New Albany, vice-president; Ernest Pickhardt, Huntingburg, secretary; Samuel Doan, Jasper, treasurer. An effort is being made by the association to arrange for a long-distance co-operative service among the independent telephone companies. All the companies of Southern Indiana, excepting those of Crawford County, had representatives at the meeting. It is the intention, should the plan be successful, to have long-distance service by the various companies between New Albany, Evansville and St. Louis and all intervening points.

The National Telephone Company is rapidly perfecting its plans for putting in its telephone system in Wheeling, W. Va., and the directors are highly pleased over the outlook. The solicitors have already booked 550 subscribers, and the 1,000 mark will be reached, it is thought, before long. Bids for the construction of the underground system are being received by Secretary Handlan. This work will begin about the middle of this month.

Straus Bros. & Co., brokers, of Ligonier, Ind., have formed a syndicate and purchased the entire exchange and toll line system of the Warsaw (Ind.) Telephone Company. The price paid is said to be about $20,000. The purpose is to give the American Bell Company stiff competition with the independent lines.

The Sullivan County Telephone Exchange held a meeting of the stockholders lately at Monticello, N. Y., at which they decided that they would supply business places with telephones at $18 per year, and private residences—three on a circuit—$12 per year.

The Tucker Manufacturing Company of York, Pa., which has a contract with the Government to furnish telephones, recently shipped another consignment of seventy-five instruments to Porto Rico.

Connection was recently made by the Delmarvia Telephone Company of Wilmington, Del., with the West Chester and other companies, by which the local company can now reach about 27 towns in Pennsylvania.

A company has been organized in Middleboro, Ky., to build a telephone line from that city to Pineville, the county seat. The construction of the line is now under way and will be finished shortly.

The People's Telephone Company of Lockport, Ill., has certified to an increase in capital stock of from $12,000 to $15,000.

At the annual meeting of the stockholders of the South Shore Telephone Company at Freeport, L. I., last week, 516 shares were represented. The entire board of directors, composed of H. P. Libby, George W. Bergen, William G. Miller, John J. Randall, Charles D. Smith, W. D. Carter and George P. Bergen, were re-elected. August Inning and Valentine G. Walters were also re-elected inspectors. The annual statement showed that the company is operating forty miles of line with a total of 358 subscribers, divided as follows: Freeport, 105; Rockwell Center, 69; Hempstead, 49; Roslyn, 29; Baldwins, 21; Lynbrook, 19; Mineola, 19; Long Beach, 11; Oceanside, 8; Hyde Park, 8; East Rockaway, 6; Merrick, 4; East Williston, 4; Greenwich Point, 3; Albertsons, 2; Uniondale, 1. The company has been granted a franchise for the extension of its lines into Oyster Bay Town, and arrangements are about complete for the commencement of the work. After the line has been constructed, it is proposed to put in a central office at Sea Cliff. The directors met immediately after the stockholders' meeting and elected the following officers for the next year: H. P. Libby, president and general manager; George W. Bergen, vice-president; William G. Miller, treasurer.

The new trunk line system of the Delmarvia Telephone Company is now opened for public service, and Delmarvia subscribers in Wilmington, Del., can talk with a half hundred or more towns in Pennsylvania. All the telephones are long-distance instruments, with metallic circuits, and the company promises prompt service. The following rates from Wilmington are for a five minutes' connection, for each minute or a fractional part of a minute an additional charge will be made equal to one-fifth of the regular rate: Coatesville, 20 cents; Collegeville, 25 cents; Conshohocken, 25 cents; Downingtown, 20 cents; Lansdale, 30 cents; Malvern, 20 cents; Norristown, 25 cents; Pennsburg, 30 cents; Phoenixville, 20 cents; Pottstown, 25 cents; Royersford, 25 cents; Souderton, 30 cents; West Chester, 15 cents. Avondale, Kennett Square, Unionville and West Grove will be connected in a short time. The new books are now in the printer's hands and will be issued soon. They will contain the new subscribers' names, and will show that the Delmarvia is very much in evidence and not on the wane.

A milion dollar independent telephone company has been organized in Louisville, Ky., and purposes to divide patronage with the Bell Company. An ordinance was introduced in the general council to grant a franchise to this company on a very low basis of charges. E. M. Coleman is the representative of the new company, which, he says, is ready to be incorporated with $1,000,000 of stock. It is to be known as the Louisville Independent Home Telephone Company. He promises that its rates shall be one-half of what the Bell Company charges. He says that an exchange and a telephone system, to cost $450,000, will be built in Louisville, and that the remainder of the capital will be devoted to building up independent lines in Kentucky. The company which owns the present Louisville system is the Cumberland Telephone Company, a Bell organization. It has a complete system, but has no exclusive franchise.

Since the increase in telephone rates recently announced by the Southern Bell Telephone Company of Norfolk, Va., the Southern States Telephone Company has advanced its rates to the full limit allowed under its charter, viz.: $38 for business and $28 for residence 'phones. The manager of the Southern States Company is preparing for a big increase in business as a result of the high rate of the rival company, and will make a number of improvements in the service, including additional cables to Norfolk.

The county commissioners of Fort Wayne, Ind., have granted to the New Haven Telephone Company a franchise including the right to construct lines from New Haven to Garr Creek, Shirley City, Baldwin, Edgarton, Adams Station, Maples, Harlan, Cedarville and Leo, all within Allen County. The Fort Wayne companies will doubtless make connecting arrangements.

Attorney J. E. Boyton and Ed Stephenson of Waco were recently in Austin, Tex., on business with the Department of State relative to the securing of a charter by which the independent telephone company of Waco and an independent long-distance line will consolidate and string other long-distance lines.

It is announced that the Northern Oklahoma Telephone Company has disposed of its lines in Kay County to the Arkansas Valley Telephone Company. The consideration is said to be $10,000.

The long-distance telephone system of the Cumberland Telephone Company is now entering Florence, Ala., and instruments will be put in at once.

The switchboard of the Independent Telephone Exchange at Whitewell, Tenn., was installed a short time ago. The switchboard is of the American Telephone Company's latest improved, self-restoring drop pattern. The instruments are of the long distance type and the construction of the lines is of material and character calculated to last and insure best service. The rates are $1 per month for private residences and $1.50 per month for business houses to subscribers within one mile of central with a proportionate increase for longer distances.

Articles of incorporation of the Farmers' Telegraph Construction Company of Milwaukee, Wis., have been filed. The capital is given as $500,000, and it is said that the offices of the company will be in Milwaukee. Some time ago articles of incorporation were filed for the Central Telegraph & Telephone Company with a capital of $10,000. This name is now changed and the capital is increased. The incorporators are Charles Sawbill, A. E. Redfield and Martin Maylan.

The Central Union Telephone Company of La Porte, Ind., has purchased the entire plant of the La Porte Telephone Company, operating a local system and toll lines to Michigan City, Westville, Chesterton, Valparaiso, Union Mills, Hanna and Kingsbury. By this move the Bell Company gains an entrance to La Porte where the council had repeatedly refused it a franchise to operate in opposition to the local organization.

The city council of Huntsville, Ala., has received a schedule of rates presented by the Bell Telephone Company. The aldermen are not satisfied, and the company will be asked submit other figures. If the Bell Company cuts rates to the figures considered by the council to be just, it is not likely that a franchise will be granted the independent telephone company, because it is believed by the council that if one company will give the people the benefit of the lowest rate it will be better to have no competitor in the field.

The Rawson Electric Company, which is trying to secure a franchise to establish a telephone system in Batavia, N. Y., will not be allowed to do so without a struggle, as the board of aldermen have received an invitation from the Bell Telephone Company to visit Niagara Falls and inspect both systems, which are in operation there, and see the difference.

The Inter State Telephone Company, which, in connection with the Home Telephone Company of Trenton, N. J., is opening up suburban communication, is meeting with considerable opposition in Bucks County. The farmers on the Inter-State Company's line between Trenton and Norristown, Pa., have put up a hard fight against the telephone line, in some cases chopping down the poles erected by the company.

The Dundee (N. Y.) Electric Light Company proposes to install a telephone system between Dundee and Eddytown, with an extension plug board at Dundee. It needs complete line equipment for this work, including instruments, cross-arms, insulators, wire, pins, plug board, etc. Address E. L Bailey, Dundee, N. Y.

The National District Telegraph Company of Louisiana, Limited, has been incorporated to construct and operate systems of telegraph, telephone and electrical service. The capital stock is $100,000.

The Kinloch Telephone Company of St. Louis, Mo., has paid over to that city about $16,000, which was 5 per cent. on the gross earnings during the 18 months the company has been in operation.

The city council of Portland, Ore., has passed an ordinance requiring telephone companies operating in that city to pay a license fee of 5 cents per month for each instrument.

The new telephone line between Susquehanna and Forest City, Pa., is gradually approaching completion.

A local line of telephones is being established in Bowdoinham, Me.

TELEPHONE INCORPORATIONS.

The Monticello Telephone Company, Monticello, N. Y. Capital stock, $2,000. Directors: Martin La Tourrette, E. H. Strong and D. S. Yeoman, all of Monticello.

The Farmland Telephone Company, Farmland, Ind. Capital stock, $1,000. Directors: T. W. Botkin, W. C. West, N. D. Good, J. T. Wright and John Nixon.

The Independent Telephone Company, El Paso, Tex.—to construct and operate a telephone exchange. Capital stock, $51,000. Incorporators: J. S. Dodge, T. B. Dockery, Mark Muler and F. B. McElroy.

GENERAL NEWS.

What is Going On in the Electrical World.

LIGHTING.

Baltimore, Md.—Mayor Hayes is looking into the feasibility of a plan to install an electric light plant in the Druid Hill Park pumping station, and there generating enough power to light the arc lamps used throughout the park.

Blair, Wis—Lovberg & Tormoen have secured a contract to erect a new power house here. The lighting of the village with electricity will be done in the near future.

Chicago, Ill.—N. Buck is preparing plans for an electric light and power plant to be built on Lake View for a stock company, which is now being organized. The plant will cost $25,000.

Crawfordsville, Ind.—In a recent fire the Crawfordsville electric light plant was partly destroyed, entailing a loss of $40,000. The work of rebuilding will be commenced at once.

Dickson, Tenn.—Nashville capitalists will erect an electric plant and waterworks here if they can secure a franchise.

Fayetteville, N. C.—The Lafayette Knitting Mill has decided to install an electric light plant.

Fredericksburg, Va.—T. McCracken, J. P. Rowe and L. Perry are the council committee on light at this place and will receive bids until September 18 for building and equipping an electric light plant of 80 lamps of 2,000 candle power.

Glens Falls, N. Y.—Extensive plans have already been made for rebuilding the electric light station of the Glens Falls Gas & Electric Light Company. Three engines and six electrical generators, which will require from 600 to 700 horse power, will be installed.

Hamlet, N. C.—This place is to have an electric light plant in the near future.

Hart, Mich—A recent electrical storm here put the electric light plant out of business.

Harrisburg, Pa.—The county commissioners lately decided to light the county jail by electricity.

Indianapolis, Ind.—The board of public works probably will refuse to renew the contract for lighting certain resident districts with gas and vapor lamps during the coming year, but may decide to figure only on electric lights.

Jefferson City, Mo.—The city council has rejected all bids for lighting the city, and will erect its own electric light plant.

Kasson, Minn.—The Kasson electric light plant and building were burned recently. Much damage was done to the boiler and engine, and the dynamo was a total wreck.

Lincoln, Ill.—The city council is discussing the question of erecting an electric light plant.

New York City.—Sealed proposals will be received by the committee on buildings of the board of education of this city at the hall of the board, southwest corner of Park avenue and 59th street, Monday, September 10, where plans and specifications may be seen and blank proposals obtained for heating and ventilating apparatus and electric lighting plant for new public schools 124 and 125; for additions and alterations to heating and ventilating apparatus and new electric lighting plant for public school 56.

Orange, Cal—The citizens of this place are agitating the question of erecting an electric light plant.

Orion, Ill.—The village board recently voted to let the contract to a Ft. Wayne, Ind., firm to build the electric light plant.

Owensboro, Ky.—This city will build an electric light plant for municipal lighting.

Oxford, Miss.—The city will issue $25,000 of bonds for the erection of an electric light plant and sewerage. W. B Cowan, mayor.

Pender, Neb—This place will have electric lights in the near future.

Red Bud, Ill—The council has appropriated $10,000 for the purpose of erecting an electric light plant to be owned and operated by the city.

Richfield, Utah—O A. Whittemore, of Provo, contemplates the erection of an electric light plant here.

River Falls, Wis—The city council has let the contract for the city electric light plant, which will cost $23,000 and will be modern and up-to-date in every respect.

Sayville, L. I.—Hewitt & Warden have been awarded the contract for installing an electric light plant complete for lighting this village.

Scranton, Pa.—The Consolidated Electric Light Company is improving its service to an extent which, it is claimed, will make this one of the best lighted cities in the country.

Searcy, Ala.—S. E. Drinkwater of Memphis, Tenn., has received a franchise for the erection of an electric light plant here.

Whitehall Wis—This village is negotiating for the purchase of a 1,000 light dynamo.

Winchester, Tenn.—C. F. Gattis of this place is in market for an electric light plant.

STREET RAILWAYS.

Augusta, Me—A well-known Maine man who is interested in electric roads recently said that if the proposed electric road between this city and Lewiston is built the coming year that he is satisfied that a road will be built from Lewiston through Mechanic Falls to South Paris and perhaps to other places in Oxford County.

Brimfield, Mass.—An attempt is being made to arouse interest in an electric road south through this place and Wales to Stafford Springs.

Coshocton, O.—The county commissioners have granted H. S. Sands of Wheeling, L. G. Hallock and E. D. McKee of Steubenville a franchise for an electric line between this place and Newcomerstown.

Douglas, Ore.—A project is being talked of here for a proposed electric road from Juneau to this place and Treadwell which will carry passengers and freight.

East Orange, N. J.—The North Jersey Street Railway Company is securing consents of property owners for the building of a new trolley line which will run to Orange Valley through the heart of this place.

Fort Worth, Tex.—S. B. Coffenberry, head of the Coffenberry-Bishop Syndicate of Cleveland, Ohio, last week purchased for himself and associates the two principal electric street railway lines here—the Fort Worth Street Railway and the City Street Railway.

Hartford, Ky—A project is on foot to build an electric railroad to Beaver Dam, thus connecting this place with the outside world.

Leland, Miss—The proposition to build an electric street railway from Greenville to this place is believed, from the men behind the enterprise and the interest already manifested, that the line will be built and put in operation without unnecessary delay.

New Haven, Conn.—The United Gas Improvement Company of Philadelphia and New York, it is understood, will apply next year for a charter to construct an extension to the trolley lines that now end at Woodmont over the country road a mile north of the present Woodmont line to Savin Rock, thence to this city.

Rockford, Ill.—All the right of way between here and Beloit has been secured by the Beloit & Janesville Electric Road.

San Bernardino, Cal.—The city trustees have granted a franchise to build an electric car line to Judge Campbell and J. H. Boyd.

Selma, Ala.—F. M. Abbott is at the head of the new company which owns the street railway line here, and is about to make the change from mule power to electricity.

Wheeling, W. Va.—The Northern Ohio Electric Company, which is to build a trolley line from this city to Wellsburg, W. Va., has organized permanently. H. Hazlett was elected president. The road will be 15 miles long.

Yonkers, N.Y.—It is stated that the trolley company is about to extend its line from Woodlawn along Central avenue to Yonkers avenue.

MANUFACTURING.

Boston, Mass.—A recently formed concern known as the International Storage Battery Company will manufacture and deal in all kinds of storage batteries with an authorized capital of $1,000,000. W. E. Hingston is interested.

Jersey City, N. J—The Witte Arc Light Manufacturing Company at No. 259 Washington street, will manufacture and deal in electrical supplies on a capital of $1,000,000. The incorporators are Arthur W. Perego, Thomas T. Payne, John S. W. Drether, Frank C. Freeman and O. W. Ruland.

Malden Mass—The Liberty Electric Company has been organized here with a capital stock of $100,000 for the purpose of manufacturing electric lamps, etc.

New York City.—The Challenge Incandescent Manufacturing Company was recently organized here with a capital of $60,000. Among those interested are Morris Kamber, Benjamin Fox and Jacob Hirschberg, all of New York.—Among the foreign orders just secured by the Bullock Electric Manufacturing Company, is one for 800 kw. direct current and direct connected generators for the street railway company at Alexandria, Egypt; also one large order which calls for many small generators for the Russian-Chinese Railroad Company. The company claims that from its display at the Paris Exposition it is already receiving direct results.

Troy, N. Y.—The E. G. Bernard Company of this city, has received the contract for equipping the plant of the Sandy Hill Iron & Brass Works with electric facilities. The contract includes placing the latest improved dynamo and motors. The works will be operated by electricity.

COMPANY MATTERS.

Aspen, Col.—The Roaring Fork Electric Light & Power Company recently purchased from George S. Newman the People's Light & Power Company's plant. The price paid is believed to have been about $40,000.

Ft. Wayne, Ind—J. J. Wood, general manager of the Ft. Wayne Electric Works, has succeeded in his efforts to enlarge the works. There will be an expenditure of almost $100,000 in building and equipping the plant with machinery, and the increase in pay roll will amount to nearly $30,000 a month.

Syracuse, N. Y.—The Onondaga Dynamo Company, of which James W. Eager is president and manager, reports an increase in business of 100 per cent. over that of a year ago. It is stated that a good trade has lately been worked up in Germany and South America.

POWER AND TRANSMISSION PLANTS.

Albany, N. Y.—Articles of incorporation of the Niskayuna Power Company were lately filed with the Secretary of State. The company is capitalized at $100,000. Its purpose is to dam the Mohawk River just below the State dam at the aqueduct for power purposes. E C. Brown, W. H. Fritchman, M. Montgomery, Mr. Landis and W. A. Graves are the directors.

Bloomington, Ill—A stock company is to be organized and a $60,000 electric power plant installed. The exhaust steam from the engine will be used to heat the buildings of the interested parties. These are Stephen Smith's Sons, C. W. Klemm, all the property owners along the east side of the court house square and the First National Bank.

Harper's Ferry, W. Va.—Geo. R. Bready, superintendent of the Electric Light & Power Company and of the pulp mills of this place, has purchased the Miller water right and land. He will erect a power plant upon it. It is located at Shenandoah City, two miles from here, with a fall of 30 feet, and is known as Bulls Falls.

La Grande, Ore—The La Grande Light & Power Company will utilize the falls in the Grand Ronde River at Oro Dell, one and a half miles above here, to secure power for operating the plant. As soon as details shall be arranged bids will be advertised for to include the construction of a new dam and the necessary work.

Portland, Me.—The contract work being done at Malson Falls in connection with the electric power plant is being pushed along as fast as possible.

AUTOMOBILES.

Faribault, Minn.—The Automobile Company of Chicago has been installing its machinery in the new factory in this city, and will now manufacture automobiles.

Indianapolis, Ind—The National Automobile & Electric Company, of which L. S. Dow is the manager, turned out its first completed vehicle a short time ago. It has a speed of twenty miles an hour. The company has a capacity of ten machines a week and employes a large force of men.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16¼@16⅜c.; Lake, 16⅜@16½c.; casting, 16⅜@16½c.

An assessment of $2.50 per share will shortly be called on Easton, Pa., Consolidated Electric stock.

According to a director, the Electric Storage Battery Company of Philadelphia is doing a very large business.

It is understood that earnings of the Union Traction Company of Philadelphia last month averaged $2,500 ahead of the same period last year.

The stockholders of the Havana (Cuba) Electric Street Railway, at a special meeting on August 30, voted to issue $1,000,000 second mortgage 6 per cent. 10-year bonds.

As far as can be learned, there is no truth in the report that the Pennsylvania Railroad Company is trying to buy up a majority of interest in the Brooklyn Rapid Transit Company.

Negotiations are under way looking to sale of the Doylestown & Bristol Trolley, operated by the Newtown Electric Street Railway Company, to the Bristol and Philadelphia Railway Company.

The Edison Illuminating Company of Brooklyn has called for redemption at 110 and interest all its bonds of 1890. Payment will be made at the Franklin Trust Company of Brooklyn, October 2.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 13@16; New York Electric Vehicle Transportation, 7½@8; New England Transportation, 3½@4; Gramophone, 35@40.

Judge Lacombe, of the United States Circuit Court, issued an order on August 31, finally discharging Hugh J. Grant as receiver of the Forty-second Street Manhattanville and St. Nicholas Avenue Railway Company. William Jay was appointed as Mr. Grant's successor as receiver some time ago.

Rapid progress is being made with the work of electrically equipping the Second Avenue line of Manhattan Elevated Railway Company of New York. The amount of work being done all over the system is greater than was ever known before since the property was built, and will still further improve a condition which officials describe as the best ever known.

There was renewed activity in Massachusetts Electric Company's securities recently, the preferred advancing ½ to 76½, and the common stock 1½ to 24½. It is estimated that the company will show earnings in excess of 3 per cent. for the common stock for the 12 months ending September 30. It is believed in some quarters that the common stock will be placed upon a 2 per cent. dividend basis early next year.

The street railway and electric lighting business in Seattle, Wash., has been consolidated under the name of the Seattle Electric Company. There were originally nine separate street railway systems, three lighting companies, one steam heat company and a gas company, each doing a certain amount of electric lighting business. In addition there were two street railway companies not in operation, making a total of twenty corporations. Of these the Seattle Electric Company now owns 14.

The Knickerbocker Telephone and Telegraph Company, recently incorporated under the laws of New York State, has filed a mortgage for $5,000,000 on all its property, rights and franchises. It was made in favor of the City Trust Company and is given to secure an issue of five thousand gold bonds of $1,000 each, payable in fifty years from September 1, 1900, with interest at five per cent. William H. Eckert and Arthur Phillips, as president and secretary, respectively, executed the mortgage. With the mortgage was filed the consent of the stockholders.

"It was said in well-informed circles," declares the New York "Tribune," "that the reorganization of the Electro-Pneumatic Company was progressing favorably, and that within a few days the property would be turned over to the new company. It is stated that holders will receive 100 shares of new stock for each 100 shares of stock of the present company. For the assessment of 20 cents per share holders will receive in return 25 per cent. in a bond, which shall bear interest at 5 per cent. per annum. This interest must be provided for before any distribution is made on the stock."

The South Side Elevated Railway Company, Chicago, has declared the regular quarterly dividend of ¾ per cent., payable September 29. Books close September 18 and reopen October 2. It is not improbable that the South Side Elevated Railroad Company's dividend rate will be increased at the coming annual meeting from 3 to 4 per cent. Several members of the board of directors are in favor of the advance, and the company is certainly making enough to pay 4 per cent. and still have a comfortable balance. Its earnings so far this year are considerably in excess of earnings for the same period last year. The figures in 1899 showed 4.52 per cent. earned on the stock. The daily average number of passengers carried in the first seven months of 1900 was 68,667, as against 59,313 in same period last year.

All the gas and electric light companies and all the trolley roads in Camden, N. J., were consolidated on August 31 and one of the biggest combinations ever formed in South Jersey was organized under the name of the South Jersey Gas, Electric & Traction Company. The officers of the new corporation are: President, Anthony Huser, of Newark; vice-president, Thomas N. McCarter, of Newark; manager, John J. Burleigh, of this city. The stockholders are Philadelphia, Camden and Trenton capitalists. The company filed with the Register of Deeds a mortgage for $6,000,000, showing that it has actually begun business. This mortgage is given to secure bonds of the company and is upon the stock of the following concerns: Camden Gas Light Company, the Camden Gas & Fuel Company, the Camden and Burlington Gas & Electric Company, the East Side Gas Company, the Gloucester Electric Light Company, the Consumers' Gas Company of Woodbury, the Woodbury Electric Light & Power Company, the Camden, Gloucester and Woodbury Railway Company.

EDITORIAL NOTES.

The Brake Question.

The recently issued report of the State Railroad Commission on tests of street car brakes, which were made in New York City between August 31 and December 2, 1899, is attracting considerable attention in street railway circles. As will be recalled an electric brake stood first in the order of merit, and a friction brake second, but although both of these devices were proved to be more efficient than the hand brakes now generally in use, it is doubtful if the various street railway companies will voluntarily abolish the present mechanism for a better type of braking appliance without drastic measures being adopted.

President Vreeland, of the Metropolitan Street Railway Company, who furnished many facilities to the State Commission for making the tests, was recently asked if his company contemplated any changes in consequence of the Commission's report, and also for his opinion of the report in general. Mr. Vreeland said:

"In the matter of such tests, there are many things to be considered. Some men offer a brake which they say will stop a car within 30 or 40 feet. Well, it will; but who would want to ride on a car like that, making 200 stops a day? At the end of a day's run the car would be good for nothing. There is no trouble in stopping a car quickly enough if you care nothing for the car or the passengers. A stone wall across a track would stop a car quicker than anything else. It reminds me of an incident in my early steam-railroad days, when a man came to the manager of the road I was on with a device to stop a train instantly. This was to be placed on the rear platform of a car, and when a spring was released some iron claws were to shoot down and grasp the rails, bringing the car to an immediate standstill, whatever might be its rate of speed."

Mr. Vreeland added that one variety of hand-power brake was in use on all the cars of the Metropolitan system, including the heaviest electric cars. This replaced the old spindle brake about five years ago. Many accidents had occurred throughout the country in consequence of the breaking of brake-chains, but this brake was equipped with a double chain, to which no mischance had ever happened on his roads.

There is no doubt but what the brakes now in use are fairly efficient, but as the tests have demonstrated that a better brake can be had, the street railway companies owe it to the safety of the citizens that the "best" brake, and not a "good enough" brake be adopted.

President Rossiter of the Brooklyn Rapid Transit Company, referring to this subject, is reported as saying that he had not yet carefully read the report of the State Commission, although his company had been "rather waiting for it," in view of its own experiments with car brakes. Long before the tests by the State Commission, in fact for the last two years, his company had been studying the subject. About 100 of its cars were now, he said, equipped with brakes which were claimed to be improvements on the ordinary kind. A number of different devices were being tested in practical, every-day operation, including electric, friction, air, and hand-power brakes. These tests were made in the ordinary course of business, scarcely a week passing, Mr. Rossiter remarked, when some improvement was not introduced on the Brooklyn surface cars. The company was anxious to adopt the best brake there was, but he could not say when a final decision would be reached. The engineers of the company were now engaged in preparing a report on the workings of the different brakes tested.

From this it will be seen that there is little prospect of an immediate wholesale changing of braking appliances on the street cars of New York and Brooklyn, and that accidents will continue to occur as usual through the inability of the motormen to stop the cars. It would be well, therefore, were this matter brought before the coming Legislature.

* * *

Electricity in the Growing of Crops.

The application of electricity to plant life is an exceedingly interesting subject and has frequently been referred to in these columns. Experiments along this line have been conducted in this country and abroad with more or less gratifying results. Recently the New York "Journal" contained an article entitled "Growing Potatoes by Electricity," in which it is stated that a resident of Ireland has devised a system for increasing potato crops by means of atmospheric electricity. According to the publication referred to, the invention was intended prima-

Digitized by Google

rily to check the blight, but it is now declared that it has the effect of increasing the yield of potatoes. The process consists in planting stakes with wires attached, and so fixed as to act as lightning conductors. These conductors are placed in position among the potatoes, and by drawing the electric currents in the air are said to cause them to be conveyed into the ground without coming in contact with the leaves or stalks of the potatoes.

The article says:

"Last October Mr. John Horan, civil engineer and county surveyor of Limerick, inspected three beds of potatoes among which the protecting wires were fixed. The first plot was protected by wires attached to stakes some seven feet long, fixed in the ground about one foot deep and cross-connected by additional wire. The second had shorter stakes cross-connected but without the upright wires, and standing some four feet out of the ground, and the third and last plot was enclosed in a sort of cage of wire setting. From these protected beds potatoes were dug out, and the yield compared with that of three plots of similar size selected at random from an unprotected area, with the result that the output from the first protected and unprotected plots was thirteen pounds and seven and a half pounds, respectively; of the second, thirteen pounds and seven pounds, and of the third ten and a half pounds and seven pounds."

Mr. Horan gave it as his opinion after the experiments that whether the system would prevent blight or not, it at any rate gave the enormous increase of 80 per cent. in the crop, and all of equal quality, as compared with the yield in other parts of the land.

We infer from the tone of the article that this method of applying atmospheric electricity to the roots of plants is considered a new one. Such, however, is not the case, as an apparatus known as a geomagnetifere, was brought out a number of years ago for collecting atmospheric electricity and used to a limited extent by the farmers in certain portions of France. This collector, which apparently much resembles the arrangement made use of by the resident of the Emerald Isle, consists of a high pole, surmounted by a crown composed of numerous copper spikes insulated from the pole by a porcelain knob or any other dielectric. A copper wire is connected to the spikes, which form the collector, and leads the current to a network of wires placed below the surface of the ground, in which the vegetables or flowers are to be grown. As there is always more or less electricity in the atmosphere, a small amount was collected in this way, which materially tended to stimulate the growth of the plants.

The experiments in Ireland are not remarkable through their novelty, but rather owing to the increase of 80 per cent. in the crops.

* * *

The Convention of the International Association of Municipal Electricians.

The Fifth Annual Meeting of the International Association of Municipal Electricians, which, as stated in our issue of August 29, will be held in Pittsburg, Pa., from September 25 to 27 inclusive, promises to be the most instructive and enjoyable meeting ever held by that Association, if the work of the various committees count for anything.

Some dozen papers will be read on subjects, which, judging from the titles, should prove very interesting to the electrical fraternity in general, while arrangements on a most elaborate scale are being perfected looking to the enjoyment of the delegates and their wives and daughters.

During the evening of the 25th there will be a trolley ride on the lines of the traction companies, which will afford the visitors unique views of the cities of Pittsburg and Allegheny by night. Hundreds of mills, furnaces and manufactories, belching forth their tongues of light and fire, like "hell with the lid off," as Mark Twain put it, will make the scene one long to be remembered.

The carriage rides for the ladies over the boulevards and through the parks on the afternoon of the 26th, will also be a most enjoyable affair. The east end boulevards (Grant and Beechwood) are many miles in length and run through the most beautiful and picturesque sections of the city. Schenley Park, which is filled with macadamized driveways, has more magnificent natural scenery than it could be possible for all the landscape gardeners in the world to equal, had they the wealth of the Indies back of them.

In the evening theater parties will be given for those who care to attend, and for those who care to see them, an inspection of some of the large iron and steel mills will be made.

The crowning pleasure event of the convention, however, will be the excursion and banquet an the steamer Mayflower, down the Ohio River at Davis Island Dam, seven miles and return, then up the Monongahela River, forty-five miles and return, on the afternoon and evening of the 27th. The Tariff Club Quintet, C. F. Harris, manager, and H. P. Ecker, City Organist, of Allegheny, will furnish music for the occasion. On this trip an elegant view of the confluence of the Monongahela and Allegheny Rivers forming the Ohio, will be obtained, and of the magnificent bridges which span these rivers. Around what is known as "The Point" cluster at this season of the year, coal fleets aggregating upwards of 10,000,000 bushels of "black diamonds," ready to be towed south when a "barge stage" comes along. Old Fort Duquesne is still standing near "The Point," and may be seen, and the Western Pennsylvania Exposition buildings as well. Passing on down the Ohio the largest gas tank in the world will be seen looming up many hundred feet in the air, on the Allegheny side, and the Pittsburg Locomotive Works, the Western Penitentiary, one of the finest penal institutions in the country, the great Schoen Steel Car Works and hundreds of other interesting sights and scenes on both sides of the river. By means of ingenious machinery Davis Island Dam may be raised or lowered at the will of the engineers. When the river is low the wickets are raised, producing a good stage of water in the harbor, and when it is high they lie flat on the bed of the stream.

In short, the municipal electricians who are fortunate enough to be able to attend the coming Convention should be amply repaid for their trouble by the pleasant outing which they will enjoy.

THE terrific storm, attended with so much loss of life and damage to property, which visited Galveston and Houston, Texas, a few days ago, ruined the electric light plants in both cities and made it impossible to reach Galveston either by telephone or telegraph. The Erie Telephone Company alone suffered a loss of $50,000.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

THE new lightship, to be anchored at Diamond Shoals off Cape Hatteras when in commission, was launched last Monday at Weymouth, Mass. This lightship will be propelled by steam and lighted by electricity.

IN Austria the use of electrical power distribution in mills and factories is becoming widespread and almost universal in the important textile industry. Recently a plant has been installed at Roveredo in the South Tyrol, in which 400 velvet-weaving looms are operated by polyphase electric motors from a central power station. Severe practical tests are said to have shown high efficiency and entirely satisfactory operation.

IN the presence of President Errazuriz and the local authorities the electric tramway system of Santiago de Chili was formally inaugurated on September 2. The public was generally delighted at the outcome and the installation of similar methods of transport will rapidly multiply.

WHAT is practically a third-rail system of electric railroading has lately been on exhibition in the Wallabout Market, at Flushing and Washington avenues, Brooklyn. It is the patent of the Union Electric Construction Company of Philadelphia, and is called the closed conduit system. It is a system founded upon three well-known laws of nature, using as its fundamental principles electricity, magnetism and gravitation. The main feature is the entire absence of trolley wires or poles, and the absence of the usual groove in the center of the tracks which in previous trials has proved such a nuisance in times of snow. Under the car are placed magnets, which raise the cable hidden entirely from view by a board covering which is as strong as the usual granite blocks. As the car passes the cable is raised, and after it has passed the cable drops by its own weight. By this means the only parts of the track that are charged with electricity are those under the car and for a distance of 5 feet both in front and behind.

VARIOUS attempts have been made in Germany, says the London Electrical "Engineer," to devise a means whereby the destructive influence exerted by the passage of heavy electric tram-cars upon asphalt pavements may be counteracted. Hitherto these endeavors have been without definite result, but much has been said lately in praise of a system which is shortly to be subjected to a practical test in Berlin. Contrary to ordinary practice, in which the tram rails are laid immediately upon a foundation of concrete, further resting in direct contact with the superimposed asphalt, the new method consists in laying the rails upon a bed of coarse gravel, and running a line of hardwood blocks along either side. Experience has taught that ordinary pavements, with gravel and stone foundations in place of concrete, offer the greatest resistance to the influence of electric cars. It is assumed that the gravel or stone allows the rails more play, which is advantageous, in that, despite great care in their manufacture, it is impossible to ensure exact uniformity with the gauge of the cars. The new method is also relied upon to reduce the noise caused by the cars running over the lines.

A SPECIAL cable dispatch to the N. Y. "Sun" states that at the meeting of the British Association for the Advancement of Science at Bradford on September 8, Sir William Preece, ex-president of the Institution of Civil Engineers, announced that he had successfully transmitted intelligible speech eight miles across sea without the aid of wires and that the establishment of such a system for commercial communication was practicable between ships or between ships and the land.

A NEW form of impulse turbine or water motor has been placed on the market by a resident of Halifax. The revolving wheel is contained within a wheel case, there being somewhat less than the usual amount of clearance between the vanes and the inside of the case. Instead of the water from the jet being received by the vanes and thrown out radially the vanes are bifurcated so as to throw the water out sideways, the water being thus discharged clear of that part of the wheel-case in which the wheel revolves. It is claimed that with this construction a minimum of friction is obtained between the water and the wheel, and that a high efficiency is the result.

PREVIOUS to the closing of Brandywine Springs Park at Wilmington, Del., for the season a novel electrical display will be given. Lights will be arranged so as to represent various symbols in different parts of the park and will be worked automatically. The details are now being completed by the park management. It is promised the display will be unlike anything ever seen in that section.

A NEW tube mill is being planned which will be erected at Sharpsburg, Pa. In this mill tubing from nine inches to 24 inches is to be made. The building will be 430 feet long and over 100 feet in width. The rolls will be equipped with independent electric motors, served with current from powerful dynamos in the electrical building already erected and equipped. When this new building is finished —which will be about January 1, 1901—this mill with the one recently completed will form one of the largest tube-making plants in that vicinity, and the only one in the world run exclusively by electricity.

PREPARATIONS for the two automobile shows to be held in this city go right along, and while each manager works independently of the other the exhibitors seem disposed to consider both together. The garden show which will run from November 3 to 10 would of itself be rather short and the exhibition space is exceedingly limited. Followed however as it will be by the longer show at the Grand Central Palace (Nov. 14 to 24) with its abundance of space affording a better display, it will give the trade an uncommon opportunity to reach the people of the East. Another point in favor of the Palace Show is that it will be held simultaneously with the Horse Show, which is such an important feature in New York that more than 50,000 visitors from out of town attend each year.

AN original entertainment was introduced at Newport, R. I., this season in the shape of a jungle party. A coach house was transformed to represent a jungle, the outside being covered with brush, boughs of banyan trees, and moss, and among the foliage were placed stuffed monkeys, electric snakes, and other animals and reptiles, all making the same cries and noises as in their native forests. Special electric light installations had been made and the illuminations were magnificent. The tables were arranged like those at a Roman feast. As the guests took their places the inmates of the menagerie were turned loose, and the blinking eyes and roaring noises gave a startling impression that they were surrounded by wild beasts. The rolling eyes and grinning mouths of the animals were cleverly illuminated by ingenious electrical devices of various colors. When this was over there came a display of fireworks and music by the Hungarian band. A novel feature was half a dozen realistic-looking snakes that were seen crawling through the improvised trees.

ACCORDING to a report from the Toronto, Ont., "World" the Eastman Electric Cloth Cutting Machine, to be seen in Machinery Hall, is exciting more than ordinary interest. The invention has proved of immense advantage to large firms as a time saver, and many manufacturers have availed themselves of such a cheapner of the cost of manufacture. The little machine in the hands of a skillful workman is capable of cutting out 2,500 pairs of pants in a day and keeping seven markers hustling to keep pace with it. The machine is light, durable, and works perfectly.

THE success of the automobile race last Thursday at Aquidneck Park has started a very lively discussion regarding the need of a track at Newport, R. I., for all sorts of racing. It is proposed to form an association for the purpose of having a track built and operated during the fall months and making automobile and local trotting events among the cottagers and townspeople regular events. Such a track, it is claimed, could be built on the ground which was intended for the polo field.

S. N. SMITH, inventor of the electric submerged motor, has recently been giving his invention a practical test on Wilson Creek in Menomonie, Wis. The motor complete weighs twenty-seven pounds, can be attached to any rowboat in a moment and, it is claimed, works successfully.

PLANS for extensive alterations to the car barns of the Metropolitan Street Railway of this city on the west side of Eight avenue, between 49th and 50th streets, were filed at the building department a short time ago. A feature of the alterations will be the providing of a place where electric vehicles may be recharged. A. V. Porter, the company's architect, has estimated the cost of the improvements at $35,000.

THE State Department has been informed that an alcohol automobile plow is in operation at Oberursel, near Frankfort, and is 25 per cent. cheaper than the ordinary steam implement. Consul-General Guenther, who makes the report on the automobile plow, says it is a twenty-horse power machine. "Confidence is expressed," he writes, "that coal can in some cases be substituted by alcohol which can be procured everywhere at a low cost. The problem of using alcohol for power purposes has been solved by the motor factory in evaporating denaturalized alcohol of 90 degrees. The construction and operation of the motor is, after this gasification, the same as that of a gas motor. The machine uses about a pint of alcohol an hour for one horse power."

MR. STANDAGE, in a recent issue of "Engineering," London, directs attention to the inflammable properties of the ordinary materials used for insulating purposes for street mains; and suggests that a non-fusible substance should be sought, with a view to diminishing the dangers that lurk in electrical installations. He points out that gutta-percha melts at a low temperature and is very inflammable, and that this is also the case with shellac and paraffin wax. But he has observed that glue may be utilized as a less fusible and less inflammable basis for a dielectric. There is a good deal to be said in favor of going wider afield for dielectrics. Glue, and the gelatines generally, may be treated in many ways so as to render them water-proof, and it is quite possible that for some purposes an effective dielectric could be obtained from a judicious mixture of this character. It is doubtful, however, whether it would be durable, and it is more than doubtful whether it would satisfy the specifications to which manufacturers have to fabricate their wares.

G. AHLFELD of Darmstadt, Germany, has recently patented an electric lamp of the Nernst type. He forms, by means of a mold, a filament composed of some of the refractory earths. This filament is burned to give it density and hardness, and then a strip of some one of the highly infusible metals of the platinum group, mixed with an ethereal oil, is painted on the filament from end to end. This stripe is allowed to dry, and is then burned into the filament after the manner generally in use in the ceramic industry. There is thus obtained along the filament a thin line of metal which is firmly adherent, and which serves to start the current through the filament, by heating the latter until its conductivity is sufficiently raised. The method of doing this heating in the original Nernst lamp was by means of a match.

REPORTS from abroad state that one of the growing industries in Bavaria is the manufacture of calcium carbide and acetylene. A well known electrical firm in Nuremberg has acquired water-power at Sarpfoss, in Norway, and also at Glommens, and other firms have obtained similar rights representing from 20,000 hp. to 40,000 hp. for the electrical production of calcium carbide. Acetylene gas is largely used in Bavaria for various lighting purposes. The first acetylene gas works for lighting small towns were erected at Hassfurt, a town of 2,500 inhabitants. There are no less than 26 small towns in Germany thus lighted.

The Edison Illuminating Companies' Convention.

The Association of Edison Illuminating Companies met at the Grand Union Hotel in Saratoga, N. Y., on September 4, 5 and 6. Thirteen papers were read and discussed (for subjects see ELECTRICITY August 29), but the papers and discussions, as has been the habit of this Association were not given out for publication.

The meeting was very well attended, there being in the neighborhood of 100 delegates present, representing the leading electrical manufacturers and lighting companies of the United States.

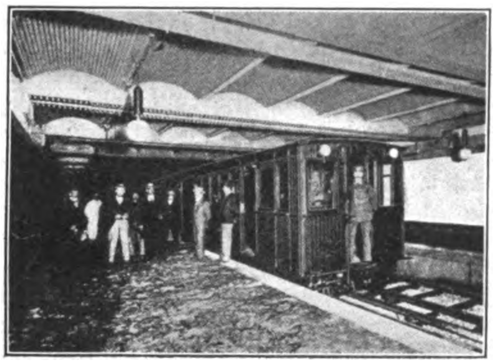
THE METROPOLITAN RAILWAY, PARIS.*

The history of the scheme, which has been proposed at various times during the past 45 years, for a convenient suburban traction service in Paris, is very interesting. It shows perfectly what wonderful effects and what changes in ideas have been the result of successful electrical traction. There were constant discussions and dissensions as to whether an overhead or an underground system should be adopted. In the early days when steam driving was the only means at hand to serve the purpose, the advocates of the overhead line were in the majority; naturally they did not wish to travel in underground tunnels, where smoke, steam and other foul vapors were present.

Of late years, however, the advocates of an underground system for Paris have been in the majority, since the objections just mentioned have been entirely removed by the successful introduction of electrical traction.

Eventually it was decided to install an underground system of electrical traction. When completed there will be about 26 miles of track of which 8¾ miles were opened to the public and commenced operation on July 19th of this year. The part in operation consists of about 6 miles length between La Porte de Vincennes and Porte Maillot, and two short branches, viz., from Porte Dauphine to Place de l'Etoile and from the Trocadero to Place de l'Etoile.

The whole of the line is double tracked,



Lyon Station.

with the exception of some very short single track loops at junctions and at terminal stations.

The subterranean tunnel of the double track has an elliptic vault about 23 feet wide, 7 feet high, and 1.7 feet thick; the vertical sides are 2.5 feet thick and 9.5 feet high; the floor is of the shape of a reversed vault, and is 1.5 feet thick, the deepest point of floor surface being 2.3 feet below the rail head.

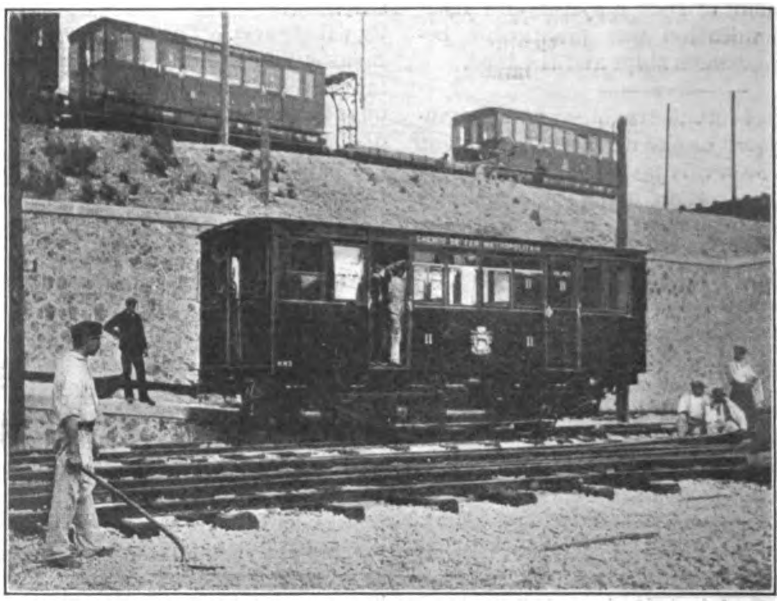
The interior of the tunnel is lined with a thickness of 0.76 inch of Wassy cement on the vault, and a similar coating of Portland cement lines the walls and the floor.

On curves with a radius of less than 328 feet, the width of the tunnel is increased. With curves of 300 feet radius, the width of the tunnel is 24 feet; with curves of 160 feet radius, the width is 25 feet approximately.

The single track tunnel has a vault of semicircular shape of about 7 feet radius and 1.5 feet thick. The height of the side walls is 8.3 feet, and their thickness is nearly 2 feet; the sides are 14 feet apart at the floor, which is slightly convex, and has a thickness varying from 1.55 feet at the center to slightly less at the sides. This tunnel at the curves of less than 100 feet is constructed rather wider at the base.

The rail track is laid on cross sleepers of creosoted wood, spaced about 3 feet apart in ballast varying in depth from about 2 feet to 0.6 feet.

The track gauge is 4.4 feet, and the rails are

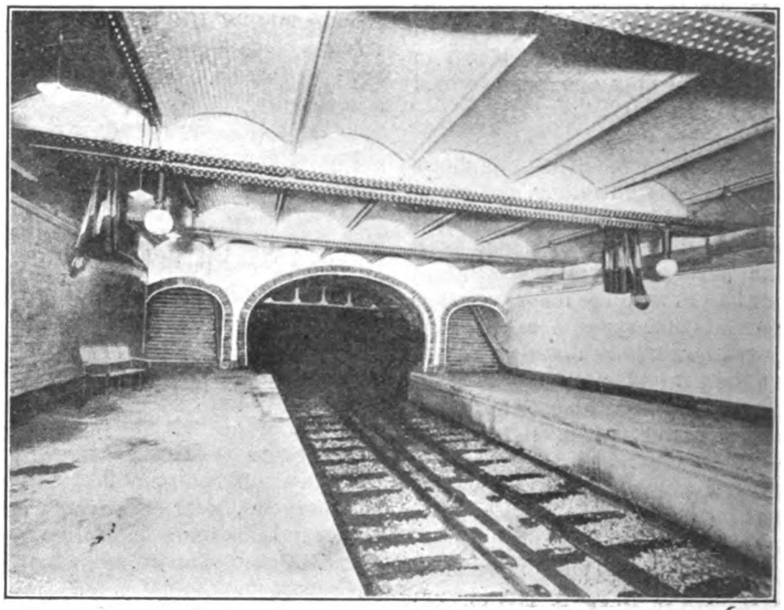


View of Carriage.

of the Vignoles type, 100 lbs. per yard, in lengths of about 50 feet. The rails rest on flat plates or chairs, the lengths being joined by four-hole fish-plates about 2 feet long.

The track is electrically equipped on the third-rail system, with track rail returns. The main rail is supported on porcelain insulators, set on extensions of every second or third track rail sleeper, according to the position of the rail joints. The conducting rail is similar to the track rails, and all joints are bonded with four copper bonds.

The stations on the parts which are in actual operation are 25 in number. The line from



Station at the Champs Elysees.

La Porte de Vincennes to Porte Maillot has 18 stations, the branch line from Place de l'Etoile to Porte Dauphine has three, and the branch from Place de l'Etoile to the Trocadero has four stations. This includes as separate stations the three distinct parts at Place de l'Etoile.

Of these stations, 17 have a vaulted roof, and are of similar construction to the tunnels, with an additional lining of glazed tiles and bricks.

Seven stations have steel girder roofs, with intermediate masonry arches, and one station alone, the Place de la Bastille, is open to the sky.

The passenger platforms are 13 feet wide, and rather more than 3 feet high above the rail-head; by this arrangement passengers step down about 5 inches into the railway train when embarking. Staircases lead from the street pavements down to the station platforms. Both the trains and the tunnels are electrically lighted; the stations with vaulted roofs are lighted by incandescent lamps, spaced about 13 feet apart, and those with the steel girder roofs are lighted by arc lamps.

The rolling stock consists of trains made up of one locomotive and two trailers. There are 46 locomotives or motor carriages; of these 34 are provided with a controller at one end only, and 12 have a controller at each end. The horseshoe arrangement of the track at each terminus obviates the necessity of running the trains in both directions, and turntables are provided should it become necessary to turn the locomotive.

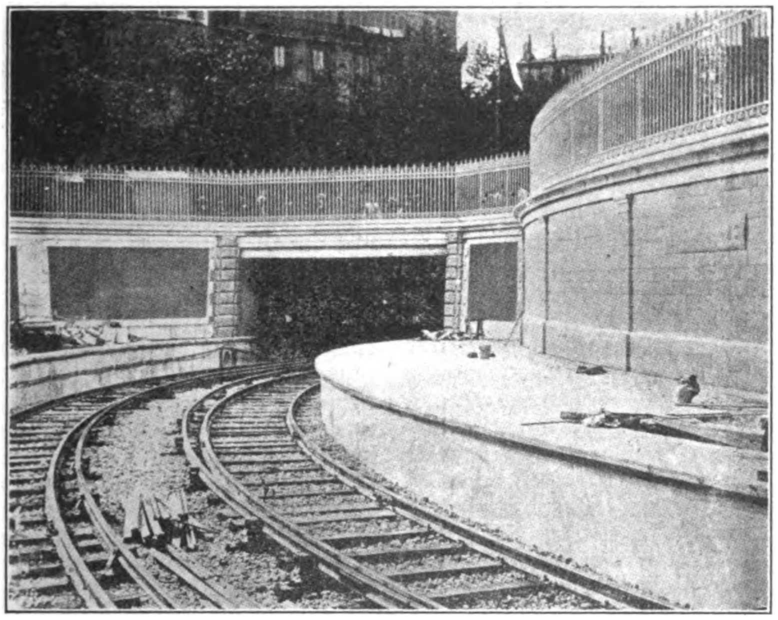
* From the "Electricial Review," London.

Digitized by Google

Each locomotive is equipped with two motors. They are of 120 hp. each, four-pole, and are entirely iron-clad. The pole-pieces are of soft steel laminations, cast into the iron sheathing or shell.

These motors were supplied under very stringent conditions as to their reliability and capacity for work under considerable overloads for long lengths of time. They were first put under the actual tests stipulated and in every case came up to their guarantee perfectly. They stood an overload for some time of 100 per cent., a pressure of 3,000 volts alternating current on their coils, and a pressure of 500 volts between adjacent commutator bars. The motors run on a 500-volt circuit when operating the railway.

The motors drive through a single reduction spur gearing, having the ratio as 1 : 2. The cables and mains, car lighting, automatic cut-outs, fuses, and in fact the whole of the electrical equipment of the rolling stock and track is Westinghouse, including the series-parallel controllers, which are of the well-known magnetic blow-out type. The total weight of a train, one locomotive and two trailers, with their full complement of passengers, is about 70,000 lbs.



THE ONLY OPEN AIR STATION, PLACE DE LA BASTILLE.

The generating station is situated at Bercy on the Quai de la Rapée.

The boilers are of the semi-tubular type, and are arranged in three groups of six each. The two engines are of 2,600 hp. each, and run at 70 revolutions per minute. They are direct coupled to the generators, of which there are both alternate and direct current sets. The alternate current dynamo is three-phase, and yields an output of 1,500 kw. at 5,000 volts pressure, and at a frequency of 25 per second. The direct current machine yields 1,500 kw. at a pressure of 600 volts. There is, of course, a full equipment of exciters, boosters, converters, switching devices, and also a storage battery. The three-phase current is supplied to a converter sub-station at Place de l'Etoile, and is changed to direct current at 600 volts to feed that part of the line. This sub-station is very fully equipped, and contains the following apparatus:—Nine transformers of 250 kw. each changing the three-phase current pressure from 5,000 volts to 360 volts, three converters of 750 kw. each, a battery of accumulators of 1,800 ampere hours' capacity, two boosters of 250 kw., and switchboard arrangements. Two sets of three-phase feeders enter this station and three direct current feeders leave it.

The fares charged on this line are 25 centimes for first class, and 15 centimes for second-class passengers, whatever the distance traveled may be.

The trains are now in full operation. The comfort of traveling, and the speedy means of getting from one part of the city to another without bother, crush or hurry on the part of the passengers has already made the line immensely popular, and ensured a prosperous future for this railway, for which Paris has waited so long.

ON THE MAINTENANCE OF CERTAIN PORTIONS OF DISTRIBUTING SYSTEMS AT EARTH POTENTIAL.*

BY C. H. WORDINGHAM, M.I.C.E.,
City Electrical and Tramways Engineer, Manchester, Eng.

From the very earliest days of the application of the science of electricity to practical needs, the earth, or as our American brothers prefer to term it, the ground, has played a prominent part, and each branch of electrical industry has in turn set up a claim to a vested interest in it. The potential of the earth is usually taken as zero, other potentials being reckoned with respect to it. This, however, does not accord strictly with the facts, since a difference of potential may, and very frequently does, exist between two points on the earth's surface; such difference of potential, however, is never very great. The earth in some text books is regarded as forming a large reservoir, and its office is stated to be that of maintaining the potential of a point connected to it at zero. Thus, if a battery has one pole connected to earth, and the other to one end of a long conductor, and the far end of the conductor be connected to earth so that a current flows, the earth is regarded as merely absorbing the electricity that passes along the wire by draining down its potential to the same value as the potential of the earth at the battery end of the line, and no actual current is supposed to flow through the earth back to the battery. This explanation is not borne out by experience, as the return currents can actually be detected, and it is more correct and more convenient to regard the earth as a large conductor through which the current actually does flow.

The earth may be used in two distinct ways. It may either be employed to take the place of an ordinary conductor, as in telegraphy and telephony, in which case the whole of the outgoing current has to return by the earth, or it may be employed merely to keep one of the conductors of an electrical system at or near zero potential. No one would now think of intentionally employing the earth in the former manner when energy was to be transmitted at any appreciable rate, and even for signaling circuits its use in this manner is attended with great disadvantages. We may therefore confine our attention to the second way in which the earth is employed, namely, to keep down the potential of one portion of an electrical system of transmission.

It will be convenient in considering the various practical instances of earth connections to divide the subject into high-pressure and low-pressure circuits, and to further subdivide the latter into those circuits which have a conductor earthed at one point only, and those which are earthed at more than one point. If there be a two-wire circuit, consisting of a generator, two conductors and a consuming device, such as a transformer, and if a given difference of potential be maintained between the two conductors by the generator, then if all parts of the circuit be equally well insulated, each conductor will assume a potential relatively to the earth, which is half the difference of potential between the two. In other words, if the pressure be 10,000 volts one conductor will be 5,000 volts above earth, and the other 5,000 volts below earth. If, however, the insulation resistance of one conductor falls below that of the other, the conductor's potential with respect to the earth will at once diminish, while that of the other conductor will increase, and, if the insulation of one conductor fails altogether it will arrive at earth potential, while the other conductor will alter to 10,000 volts above or below the earth, as the case may be. Now it is obvious that if the conductors be insulated only with a view to withstanding the normal potential from earth, i. e., 5,000 volts, an undue stress will be placed upon the better insulated conductor when the insulation resistance of the other falls, and this stress may be sufficient to cause the other to break down also. Inasmuch as it is impossible to foresee which conductor may assume the potential of the earth, it would appear that if both have to be insulated, both must be capable of withstanding a pressure of 10,000 volts. It was first pointed out, the author believes, by Mr. Ferranti, that, seeing that either conductor might have to withstand the full pressure, it would be best to at once face the situation and insulate one of them for the maximum pressure possible, and insure that it alone should be subjected to this pressure by deliberately connecting the other conductor to earth. This exceedingly simple, and at the same time ingenious device, at once diminished the risk of breakdown and cheapened the cost of insulation, but at the same time it enabled a further great advantage to be reaped by admitting of much greater security to life being introduced. This end was attained by completely enclosing the insulated conductor within the uninsulated one, thus rendering it physically impossible to handle a conductor at a danger-

* Paper read before the Municipal Electrical Association at Leeds, Eng., June 23, 1900.

Digitized by Google

ously high potential, and if by any chance the outer conductor should be cut through, a short circuit would be established before the inner conductor could be touched.

This system has been almost universally adopted for two-wire high-pressure circuits, and is perfectly familiar to all at the present time, but it is worth while recording the fact that when originally introduced many people looked askance at connecting a high-pressure conductor to earth. For systems of transmission employing more than two wires the same perfect security cannot be attained, but a near approach may be made with two-phase working by employing two separate concentric cables, the outer conductors of which are connected to earth, or by enclosing two parallel conductors within an outer envelope. In three-phase working, if a star winding be employed, the middle point of such winding may be connected to earth. When this is done the stress on the insulation from earth is diminished to the smallest possible value, but all three conductors have to be insulated. It is important that one point only of the zero potential conductor should be conducted to earth, because inasmuch as there must of necessity be some fall of potential in the outer conductor, there exists between any point and the one connected to earth a difference of potential depending upon the resistance of the conductor and the current flowing through it. So long as the outer conductor is insulated from earth, except at one earth connection, no current can pass through the earth; but if a connection be established with earth at some distant point, the difference of potential between it and the other point will cause current to flow through the earth.

A digression may here be made to point out exactly the manner in which such return currents travel through the earth. A most instructive experiment carried out by the author in his student days, under Prof. W. Grylls Adams, made such an impression on him, and has been found by him to be so helpful, that he may perhaps be pardoned for describing it. In a large flat sheet of tinfoil two needles were fixed, connected respectively to the two poles of a battery, which thus sends a current through the tinfoil. A sensitive galvanometer was provided, and its ends connected each to a needle; one of these needles was stuck at random into the tinfoil, and the other was moved about on the tinfoil until a point was found which gave no deflection on the galvanometer. The needle was then pressed into the tinfoil, and an impression left on a sheet of clean paper underneath. A series of such positions were found, corresponding to an equi-potential line in the tinfoil. The first needle was then moved to a new position and a second equi-potential line traced out. When a sufficient number of such lines had been determined, other lines normal to them were drawn between the two points to which the battery had been connected. This, of course, represented the lines of flow of the current. Any-one who carries out this experiment for himself, will be at once struck with the number and diversity of the paths along which the current can flow. These paths spread out in the same manner as the lines of force from a magnet, and extend to a great distance away from a direct line.

In the case considered of a conductor carrying a heavy current and unearthed at two points of its length, the current may return from one point to the other by paths that are an almost incredible distance away from the main conductor, though, of course, the bulk of the current will take the shortest possible path through the earth. If two plates be buried in the earth at two points along a line of flow and be connected together through a conductor, this conductor will take up a portion of the current. If the conductor be part of a signaling circuit the signaling currents will be interfered with, and, with any conductor, electrolytic action may take place at one or both points of connection with the earth. If, instead of dealing with the high pressure, we are dealing with low, exactly the same effect will be produced by making one or more earth connections to a conductor, but the objects of making the earth connection are usually different. In the case of a low-pressure distribution system, the object of earthing one conductor is not to diminish the cost of the insulation, since no appreciable saving is made by using a pressure of, say, 200 volts instead of 400 volts, nor is it to secure safety to life; the chief object is to enable a consumer to be supplied at such a pressure that no one of the conductors brought into his house will exceed the limit of pressure defined by the Board of Trade to be low pressure. In the case of electrically-driven tramways, the one object is to enable the rails to be used as one conductor, chiefly with a view to simplifying the working arrangements, and partly to enable the conducting power of the rails, which must in any case be laid, to be utilized. In this last case it is obvious that the conductor is connected to earth throughout its length, and the only way to obviate the difficulties pointed out on the score of current returning by the earth is to keep the difference of potential between the ends of the earth conductor so low as to cause the amount of current returning by the earth and metallic structures buried in it, other than the rails, to be very small. With these preliminary observations we may now consider some particular cases. The author regards all the high-pressure systems as systems of transmission, though it is true that at present high pressure is still used to some extent for distribution. Inasmuch as this paper deals only with the earthing of distribution systems, the author proposes to confine his attention to these.

The most important case of earthing conductors is undoubtedly that of tramways. The system adopted so largely in America has been imported into this country, and every tramway system, excluding battery driven cars, is being worked with one conductor insulated and the other consisting of the rails connected to earth. It is well known that if the difference of potential between the end of the earthed conductor which is connected to the source of energy differ in potential considerably from that of a distant point on the same conductor, the current returning through the mass of the earth and through pipes buried in it may be very large and may cause most serious damage to the pipes by causing the metal to be dissolved at the points at which the current leaves. How great this difference of potential must be before serious damage is done is a matter upon which there is not a large amount of information available. The Board of Trade have fixed the limit of what may be allowed at 7 volts, but it is maintained by some authorities that this limit is too high and that a lower potential than 7 volts will cause damage. This point is receiving a considerable amount of attention at the present time and the author is himself engaged in a joint investigation with engineers of other departments of the Manchester Corporation with a view to thoroughly thrashing out what is the minimum difference of potential that can be allowed. It is obviously in the interests of all concerned to arrive at reliable data on the subject. If 7 volts be found to be safe, well and good, but if not the sooner it is known to be dangerous the better. All engineers must be agreed that the lower one can keep down the difference of potential the better. The object may be effected in various ways. One of the most common is to provide auxiliary conductors of low resistance which are tapped on to the rails at various points to supplement their conductivity. Another device is to employ similar conductors but to lower the potential of the far end by means of so-called negative boosters which subtract instead of add a certain number of volts. A third means, and in the author's opinion the best and most effectual, is to feed the line from a number of independent points either by means of a number of generating stations, or, preferably, by means of a number of transforming sub-stations. Except in the case of very heavy traffic this method should prove effectual without either the employment of return feeders or negative boosters.

The simplicity and reliability of the so-called overhead system of traction is such as to render it worth while to go to great lengths to retain the system, but if it be found and clearly demonstrated that extremely minute differences of potential are sufficient to cause serious damage to underground structures in urban districts, it will be necessary to reconsider the whole position, and perhaps to adopt an insulated return conductor, or else to fall back upon a battery system of self-contained cars, either of which expedients would be greatly to be deplored,

The second case of earthing in order of importance is that of one conductor of ordinary lighting and power circuits, and it is on this point that the author desires to raise discussion chiefly. It has been hotly debated, and much difference of opinion still exists as to whether it is desirable or not to earth the middle wire of a three-wire system. Let us consider what are the advantages and disadvantages of such a course. The main advantages are the following: (1) By earthing the middle conductor the extreme difference of potential that can be attained by any one of the conductors from earth is halved, and all can be handled not only with great safety, but practically without inconvenience. (2) The stress on the insulation is halved. (3) All three conductors may be taken into a consumer's premises for all pressures up to and including 250 volts pressure across the outers without contravention of the regulations of the Board of Trade. This advantage is undoubtedly by far the most important. (4) Immediate notice of a leak on one of the outer conductors is given.

The disadvantages of earthing the middle conductor are: (1) If a leak exists on one conductor, current is continually forced through it, thus causing in many cases complete destruction of the insulating material. (2) A leak on one conductor produces a short circuit on one side of the system of distribution, unless the earth connection is removable at will.

In Manchester the Board of Trade require that the middle conductor shall be maintained at or near the earth potential, and the author has now had nearly seven years' experience of this system. In his judgment there can be no possible doubt that at all events with continu-

Digitized by Google

ous current, and quite possibly with alternating, the effect upon the insulating material of the negative main is most severe. In operating a system of distribution by means of continuous currents, it is always found that if none of the conductors be deliberately earthed those connected to the negative pole assume earth potential; the positive conductors consequently being at the maximum potential above earth corresponding to the pressure used on the system. The reason for this is well known. It is the phenomenon known as electric osmosis, whereby moisture tends to travel away from the positive pole and towards the negative pole. Whatever system of mains be employed there are always many points at which surface leakage can take place, and whether the conductors be bare copper on porcelain insulators, or be continuously insulated cables, at every point where the conductor is exposed leakage from the negative pole will take place, but if the negative conductor be kept near earth potential, this tendency will be small. If, however, the middle conductor be deliberately connected with earth so that the negative outer is kept below earth potential, a current corresponding to the amount of the leakage will be constantly forced through the leak, and the tendency for moisture to flow to the negative conductor will be maintained. If the leakage was confined to the surface of the insulation at points of connection to the conductors the result would not be so serious, but the author has found that with certain makes of rubber the material is evidently porous, and small as is the leakage current at first, it is sufficient to cause water to enter through the pores of the rubber, and the conductivity of this water so increases the leak that in course of time the whole of the rubber on the negative conductors is destroyed, large blisters forming within its substance and becoming filled with strongly alkaline liquid almost certainly derived from the substances mixed with the rubber. The rubber is often much distended, causing the liquid to be under considerable pressure. In course of time this pressure increases to such an extent as to burst the rubber, causing a hole completely through the insulating material. It is clear that the water could not merely flow into these blisters; it is almost certainly driven in by osmosis. What happens with rubber may happen with other materials and, in the author's opinion, there can be no doubt whatever that very grave risk of breakdown of the insulation of the negative conductors is introduced by earthing the middle conductor.

As a set-off against the above inconvenience it must not be forgotten that the insulation resistance of the positive conductors is substantially improved by earthing the middle one, but very little importance need be attached to this, since, as already stated, the negative conductor would be at earth potential if the middle one was not earthed and the tendency to dry the positive outer would then be doubled. The only consideration that impels me to desire to earth the middle conductor is the fact that it admits of all three conductors being brought into a consumer's premises, thus enabling every installation to be balanced within itself if it be of sufficient size to render it desirable to do so. The author is convinced that the only method of effectually balancing a multiple wire system is to carry that balancing back to every consumer except to consumers of the very smallest size and, therefore, it is of great importance to be allowed to bring the three conductors into installations. Serious as are the disadvantages this advantage is, in his judgment, sufficient to outweigh them, and, therefore, he would, on the whole, decide in favor of earthing the middle conductor, but if this be done it must be clearly understood that it necessitates the utmost care in protecting the mains from moisture, and the only possible system of laying them becomes the so-called solid system, in which every cable is completely surrounded by a thoroughly waterproof material, or an air-insulated system with accessible porcelain insulators at intervals, as in the Crompton system of bare copper. If it be granted that the middle conductor should be earthed, the question at once arises should it be permanently and irrevocably earthed or should the earth connection be capable of removal at will? The author would unhesitatingly reply "it must be removable." The first consideration is conti nuity of supply, and, if a leak developing on one conductor is to cause a short circuit the chances of interruption are increased manifold beyond what they would be if the earth connection could be removed until the fault had been localized and repaired. It is quite clear that the chances of a leak occurring on one conductor are many times greater than those of two leaks occurring on two separate conductors simultaneously. It may be argued by many that if the earth connection is liable to be removed all the advantages of making it at all are done away with, since the distribution of potential will alter when it is cut off. To some extent this is true, but it must be remembered that the connection would only need to be removed for short periods and at long intervals and, therefore, in practice but little risk would arise. If it were a question of dangerous pressures it would be entirely different; in such case the earth connection must never be removed while the main is in use. Once it be granted that the earth connection must be removable it becomes obvious that the conductors must be earthed at one point only, and that must be easily accessible from the generating station. This consideration shows that it is impossible to allow one of the conductors in a consumer's installation to be uninsulated, a system of wiring frequently advocated by some on account of its cheapness and some other advantages.

There is, however, another reason for not using this system of wiring, depending on the undesirability, already pointed out, of earthing a conductor at more points than one. It is often argued by the advocates of the system that the balancing wires carry so little current that the fall of potential in them is negligible. It is true that balancing wires frequently bring back but little current to the generating station, but locally it is unavoidable that these should be heavy currents, causing substantial differences of potential, flowing between the various installations, composing a balanced main, and these differences of potential may cause destructive electrolysis, and, with alternating currents, interference with telephone lines. Certain special features arise in connection with a distributing network fed from transforming sub-stations supplied with high-pressure current, to which attention may be called. In a case likely to become not unusual in practice, namely, that of three-phase transmission with rotary converters supplying continuous current to the network, it will probably be required that the grouping of the transformers shall be star and the middle point be earthed. Now, if this point, which is also directly connected to the middle distributing conductor be earthed at the transformer, we shall have all the disadvantages of a middle conductor earthed at several points. A much more serious case will, however, arise if, in addition to this, the middle wire be opened between two sub-stations but the outers be carried through. In such an event the whole balancing current may be conveyed by the earth and do great damage. A similar difficulty would arise with balancing transformers distributed at various points of the network if the middle wires are not continuous throughout, and an earth connection is made in the balancers. In order to comply with this condition of earthing the middle point of the transformers, the earth should be made by connecting the middle wire to the point in question and earthing this middle wire at one point only for the whole system.

The author has made no attempt to treat this subject at all fully, his desire being merely to raise a discussion on the subject generally of connecting any portion of a distribution system to earth, the chief points being: (1) Should any portion of any system of distributing conductors, whether for the ordinary supply of energy or for traction, be connected to earth. (2) If such a course is desirable what conductor or conductors should be earthed, and at what point or points. (3) What difficulties may be expected from earthed conductors, and in what way may these difficulties be met, especially in the case of distribution for electric traction purposes.

The Canadian Electrical Association Convention.

The Canadian Electrical Association held its Tenth Annual Convention at Kingston, Ont., from August 29 to 31. Addresses of welcome were delivered by Mayor Minnes, Mr. Donnelly and Mr. J. B. Pense. The annual address was delivered by President Dion. The papers presented were unusually interesting and were on the following subjects: "Conditions Affecting the Wave Form of Alternators," by Prof. L. A. Herdt; "Power Factor as Affecting Operation and Investment, With Special Reference to Induction Motors and Enclosed Arc Lamps," by F. H. Leonard, Jr.; "Rotary Converters," by A. Gordon Grier: "Use of Dynamo and Storage Battery in Telegraph Offices," by W. J. Camp.

Mr. Leonard's paper proved most interesting and instructive and was the means of eliciting a very able discussion in which many prominent engineers present took part.

In connection with other things the delegates were treated to a searchlight excursion among the Thousand Islands, as well as a boat ride. The annual banquet was held at the Hotel Frontenac on the evening of August 30 and was a brilliant affair.

On August 31 the following officers were elected for the ensuing year:

President—A. A. Dion, superintendent Ottawa Electric Company, Ottawa.

First Vice-President—E. E. Cary, manager Packard Electric Company, St. Catharines, Ont.

Second Vice-President—P. G. Gossler, Royal Electric Company, Montreal.

Secretary-Treasurer—C. H. Mortimer, "Electrical News," Toronto.

Executive Committee—Messrs. A. B. Smith, O. Higman, D. R. Street, J. J. Wright, B. F. Reesor, F. W. Simmons, W. H. Browne, J. W. Camp, John Yule and Edward Slade.

LAHMEYER EXHIBIT AT THE PARIS EXPOSITION.

BY FRANK C. PERKINS.

The electric exhibit of Messrs. W. Lahmeyer & Co., Limited, electrical engineers and contractors, Frankfort-on-the-Main, consists of a 1,500 hp. compound steam engine running at 94 revolutions per minute, and two dynamos, one for 1,000 kw. three-phase current at 5,000 volts, the other for 400 kw. (maximum) at 500 volts; both are coupled directly to the engine shaft, as shown in Fig. 1.

The three-phase generator is of the fly-wheel type, i. e., the field magnets are fixed on the periphery of the fly-wheel and the armature on a large frame, which completely encloses the field magnets. (See diagram Fig. 2 and 3.) The speed variation during one revolution is 1-300th of the normal speed only.

By this combination of dynamo and fly-wheel the space required for the set is minimized, the material is almost entirely utilized, the magnetic leakage and the armature reaction are very small, the ventilation is excellent and efficient.

The fly-wheel consists of four pieces held together by bolts and wrought iron rings. The magnets are of wrought iron and are fixed by one wrought iron bolt and one steady pin each, so that each magnet can easily be removed, rendering it unnecessary to dismantle the dynamo. The cross section of the magnet is circular, so as to give without any excessive pressure drop a minimum of the winding length and consequently of loss of energy in the coils.

The pole pieces are almost square, so as to reduce as much as possible the magnetic leakage. They are of solid wrought iron, thus giving a more substantial construction than laminated magnets and render any resonance impossible, when the machine is working in parallel with other machines. The eddy currents generated in the magnets help to prevent a "drive" on the machines by their damping effect. Excessive heating of the machine is prevented by correct dimensions of the air space, and a suitable form of the slots in the tunnel-wound armature.

Each coil is formed by a rectangular copper ribbon, the width of which is normal to the surface of the magnet. The insulation consists of paper. By so wiring the space of the magnet is well utilized and a deformation of the coil by the effect of the centrifugal force is practically obviated.

The excitating current is generated by an exciter mounted on the same shaft as the main dynamo giving 65 volts, seen in Figs. 1 and 2.

The voltage of the three-phase generator is regulated by inserting resistance in the fields of the exciter, this arrangement doing away with the heavy resistances usually employed in the main circuit, so avoiding loss of energy and all risks of heating at the back of the switchboard.

The armature is stationary and consists of laminated iron, the segments of which are held together by bolts in a cast frame. Two end plates, reinforced by radial arms, render impossible any vibration of the frame, so that the machine runs almost without noise even at full load.

The armature generates current at 5,000 volts, and is wound in micanite tubes, which have been subjected to an insulation resistance test at 10,000 volts. The tubes and the slots are of circular section. This secures a good insulation and at the same time the hysteresis and eddy current losses in the teeth are minimized.

The energy losses are as follows:

Power absorbed by armature copper	13,700 watts.	
" " " " core	13,100	"
" " " " teeth	9,100	"
" " " excitation	13,800	"
Total	49,700 watts.	

The electric efficiency is therefore 95.3 per cent. at full load (non-inductive).

Special attention has been given to secure a small drop in voltage between full and no load. It is about 6 per cent for non-inductive load. This result is attained by a strong magnetic field and high saturation of the magnets. The short-circuit current is about 3.5 times the current at full load for a constant excitation.

The magnetization of the iron is always beyond the bend of the curve.

The method of arranging the measuring instruments is patented by the Messrs. W. Lahmeyer & Co., Limited.

This arrangement excludes any possibility of an accident to anybody in proximity to the instruments, as all readings are taken off a low tension circuit.

In each phase, one of the armature coils is separated from the others and is connected with the primary windings of a special transformer (ratio of windings 1 : 1), the secondary windings of which are in series with the rest of the coils. All readings are taken, in the primary windings, the amperes in these being the same as in the machine. The voltmeter is calibrated so as to give the voltage of the one coil multiplied by the number of coils, thus giving the voltage of the dynamo.

This arrangement gives very exact readings, and the difference of the air space at the different coils does not influence in any appreciable way the accuracy of the readings. This patent has been applied to many machines built by the Messrs. W. Lahmeyer & Co., Limited, and has given entire satisfaction.

The shaft of the combined set is made in three pieces coupled together by ordinary flanged couplings. The exciter armature is wound on the end of the shaft, which extends beyond the extreme bearing on the three-phase side of the set. The exciter fields are bolted to a bracket, fitted to the pedestal.

As we have seen above, a direct current dynamo (see Fig. 1) is coupled to the engine shaft on the other side; this dynamo is built for a normal capacity of 400 kw. at 500 volts and 94 revolutions per minute.

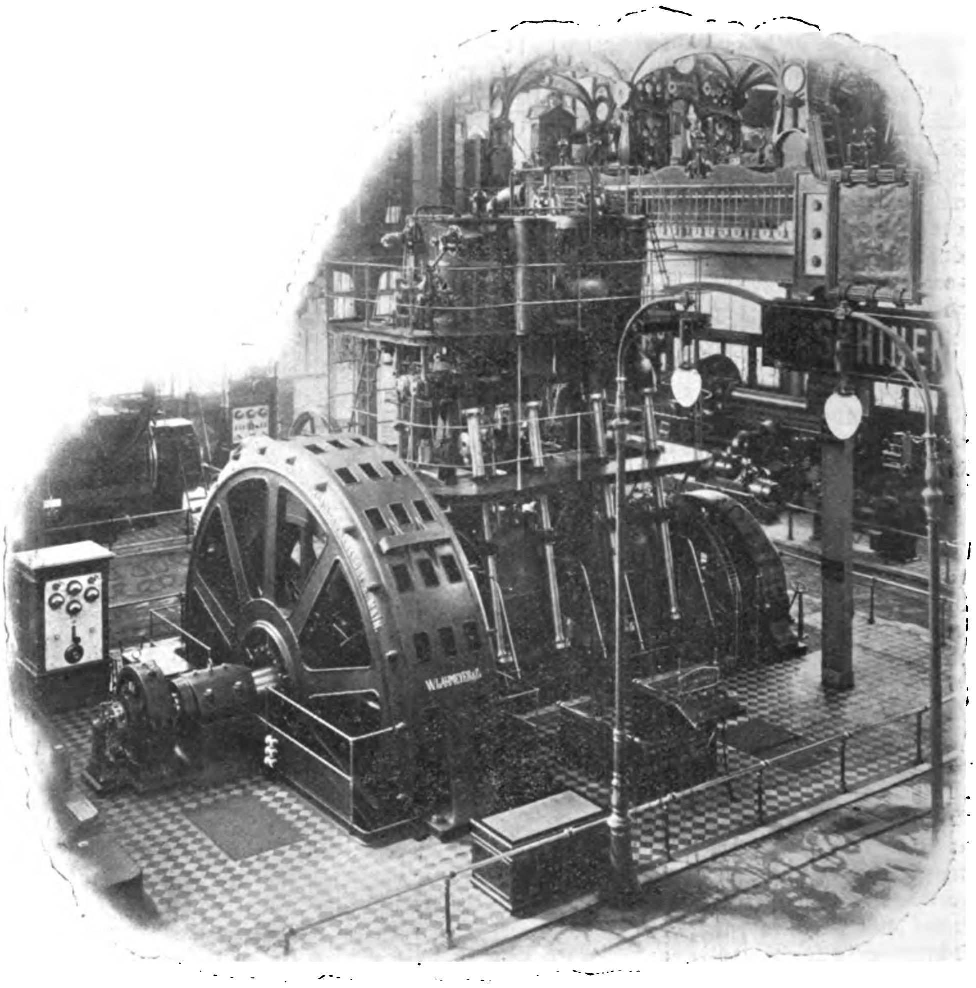

FIG. 1.

The dynamo is of the multipolar type. The yoke consists of two semi-circular parts on which twelve cast steel poles are held each by two iron bolts. The poles and pole pieces are cast in one piece (see diagrams Fig. 4 and 5).

The armature is of the drum type, and is bar wound in two layers in 609 milled slots, which are insulated with mica. The armature is not banded in the ordinary way, but the conductors are secured on small brass strips, which are held on the periphery by pins. At the back end of the armature all connections are in a piece with the conductors, the bars having been bent on a special former, so that the number of sweated joints is reduced to a minimum. The method of fixing the winding by these strips facilitates removal of a damaged bar. The commutator is built up of cold drawn copper segments with mica insulaton.

The brush connections are fixed on an I shaped ring, and are well insulated by ambroine. All screws of the brush holder which can possibly

Digitized by Google

be gotten at from the outside are protected by caps of the same material.

This machine has been designed for traction work, and is specially adapted for severe overloads and sudden variations of the load, without sparking of the commutator. Even at 440 volts (the pressure used at the Exhibition) no rocking of the brushes is necessary.

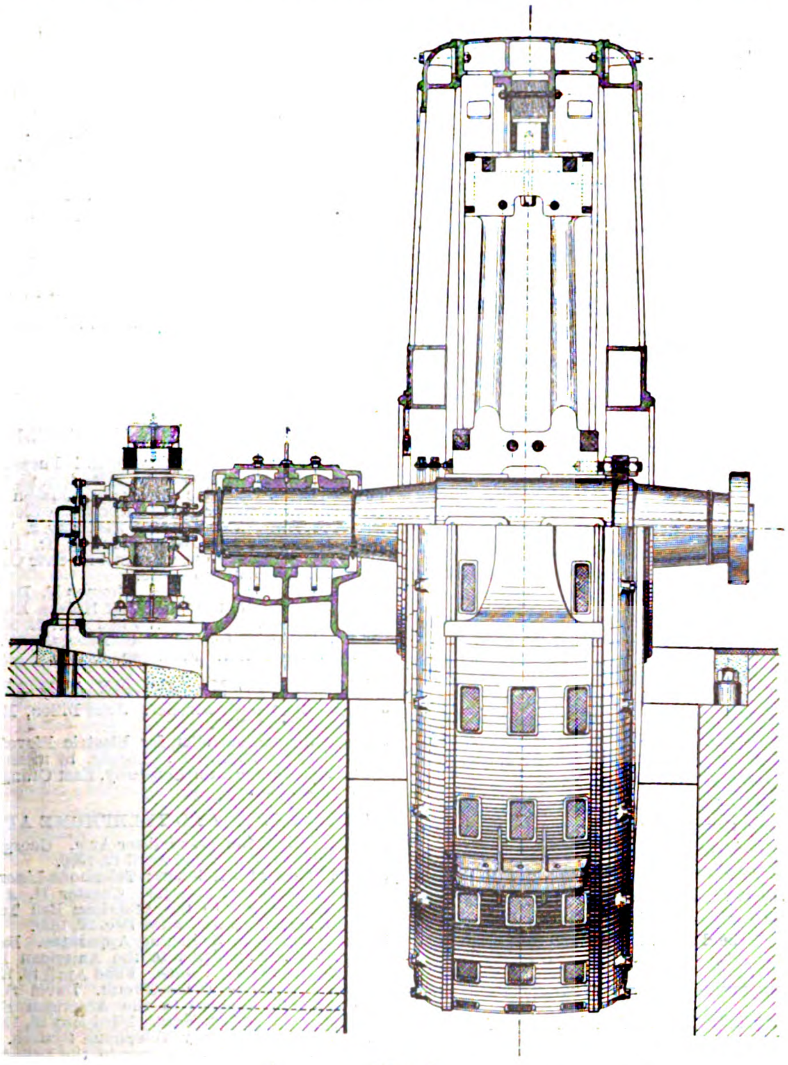

FIG. 2.

power absorbed by the armature copper is 2 per cent., by the excitation 1.5 per cent. There is very little heating, the rise in temperature being only 30° C for the armature iron, and 25° C for the induction coils.

The saturation of the iron is such as to give (at constant excitation) a difference in voltage of 10 per cent. only, between full and no load.

700 revolutions). This switch pinion engages itself automatically as soon as the machine is started.

The steam engine was supplied by the Maschinenbaugesellachaft Nürnberg. It is a vertical, 2-crank engine and develops 1,700 ihp., or 1,500 ehp. at 10 atm. (147 lbs. per square inch). The engine is provided with a jet condenser. It is bolted to a bed plate which consists of two parts. Each part is cast in one piece with 8 bearings. The shaft has a coupling at both ends for connection with the dynamos.

Diameter of high pressure cylinders 865 mm. (34 1-16 inches); diameter of low pressure cylinders 1,350 mm. (53½ inches).

Stroke 1,100 mm. (43 5-16 inches).

The two air pumps are driven from the connecting rod by means of a beam, diameter 670 mm. (26⅜ inches).

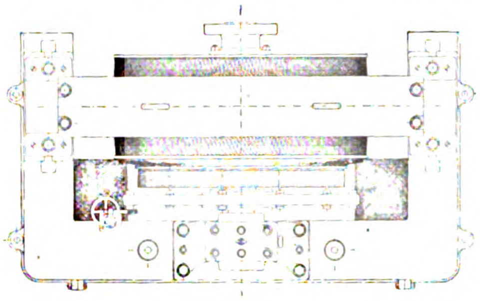

FIG. 4.

Stroke 350 mm. (13¾ inches).

The approximate weights are as follows:

Steam engine....	120 tons.
Three-phase dynamo.........	124 "
Direct current dynamo.......	31 "
Total weight..............	275 tons.

At the Exhibition the oil is supplied by the Vacuum Oil Company of New York. Many difficulties were experienced during the transportation, because of the three-phase dynamo. The way in which these difficulties have been overcome, is graphically illustrated on the annexed figure.

In consequence of the high pressure at which current is generated in the three-phase machine, many very distant points in the Exhibition are illuminated by its agency, for instance, the Alexander Bridge and the Main Portal of the Exhibition.

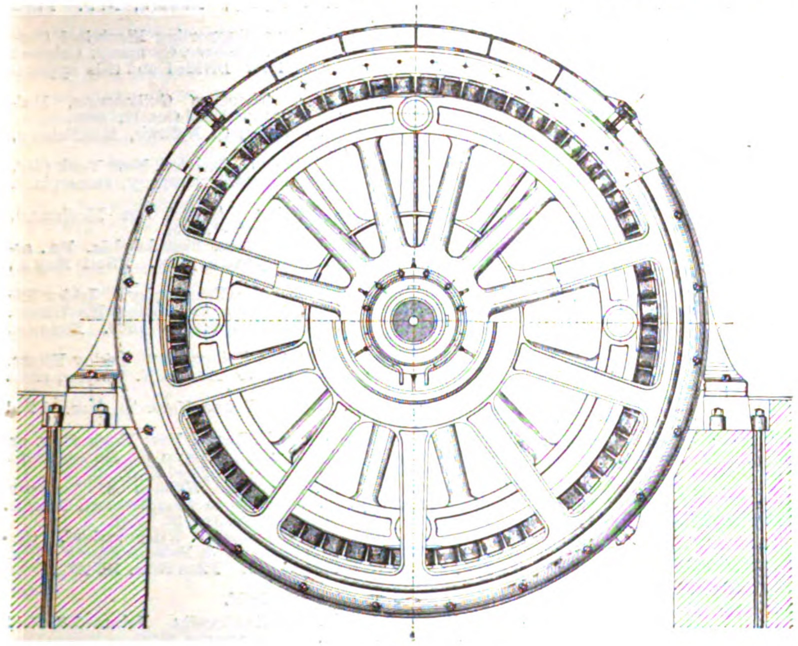

FIG. 3.

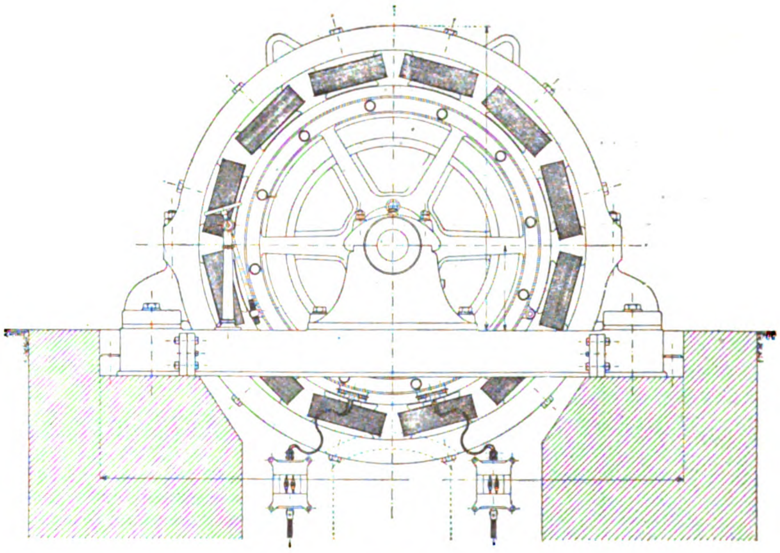

FIG. 5.

The diameter of the armature is 1,400 mm. (55 inches), its length 400 mm. (15¾ inches).

At full load and 530 volts the mechanical and electrical efficiency is 93.2 per cent. The

For starting the engine the following arrangement has been devised. A toothed disk has been placed on the shaft which is engaged by a small pinion driven by a 7 hp. motor (230 volts,

The International Electrical Congress.

The International Electrical Congress was opened at Paris Saturday, August 18, in the Palace of Congresses. The United States, France, Germany, Italy, England, Russia, Hungary, Austria, Belgium and Switzerland were well represented. Addresses were delivered by M. Goumeux and Prof. Mascart. The following permanent officers were elected :

President, Prof. E. E. N. Mascart; secretary, Prof. Paul Janet; reporter, Prof. E. Hospitalier; vice-presidents, France, H. Moissan, H. Fontaine and E. Gariel; United States, Carl Hering and A. E. Kennelly; Germany, F. Kohlrausch and Dorn; Great Britain, Sir W. H. Preece and Prof. John Perry; Italy, Prof. Colombo; Belgium, Prof. Eric Gerard; Austria, Max Jullig; Hungary, Etienne de Fodor; Russia, Prof. Chatelain; Switzerland, Mr. Turrettini.

The Congress was divided into five sections as follows: Section I, Scientific Methods and Measuring Instruments; Section II, Electrical Generation, Transformation, Transmission and Distribution, Electric Lighting and Traction; Section III, Electro-Chemistry; Section IV, Telegraphy, Telephony and Miscellaneous Applications; Section V, Electro-Physiology.

During the Congress papers on the following subjects were read: "Cost of Current for Electric Railways," by Mr. Postel-Vinay, "Concerning the Construction of Dynamo-Electric Machines," Maurice Leblanc: "Excitation of Induction Machines," Maurice Leblanc; "Utilization of Condensers," P. Boucherot: "Converters and Rectifying Transformers," P. Janet; "Summary of the Decisions of Former Congresses," E Hospitalier; "Actual Condition and Progress of Telegraphy Without Wires by Hertzian Waves," André Blondel and Gustave Ferrié; "The Electric Furnace," Mr. Keller; "Behavior of Alternators Connected in Parallel," G. Chevrier; "Precise Measurements of Alternating and Polyphase Currents," G. L. Addenbroke; "Photometry," J. Violle; "Concerning Electromagnetic Mechanisms, Silvanus P. Thompson; "Electrochemical Deposition," Henry Bouilhet; "Progress in Electric Lamps," André Blondel.

During the Congress an opportunity was afforded the delegates to visit the various electrical undertakings of interest in the neighborhood.

The following members of the American Institute of Electrical Engineers were present and took part in the discussions: Carl Hering, A. E. Kennelly, C. O. Mailloux, W. J. Hammer, Captain John Millis, U. S. A.; W. D. Weaver, B. J. Arnold, V. R. Lansingh, J. M. Hollister, I. R. Edmonds, A. Oolgaardt and Prof. F. B. Crocker.

Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended September 5:

Antwerp, 45 packages, $5,608; Argentine Republic, 339 packages, $783; 15 motor cars, $26,050; 167 cases, $20,656; Australia, 20 cases, $520; Berlin, 3 cases, $775; 3 crates automobiles, $381; British East Indies, 6 cases, $1,150; 6 packages, $1,000; British Guiana, 2 packages, $250; British West Indies, 10 packages, $475; Brazil, 27 packages, $1,026; Brussels, 2 cases, $390; Central America, 30 packages, $380; Chili, 2 cases electric belts, $250; 35 packages, $1,536; China, 5 barrels, $200; Cuba 40 cases, $783; 1 case motors, $15; Dundee, 1 case, $133; Ecuador, 2 packages, $38; Glasgow, 43 cases, $17,705; 70 reels electric cable, $13,454; Hamburg, 102 packages, $3,430; 25 cases, $8,280; Havre, 150 cases, $5,072; 1 package, $20; Hong Kong, 21 packages, $392; Japan, 65 cases, $3,150; 166 packages, $3,042; Liverpool, 49 cases, $18,280; 75 trolley poles, $2,200; London, 206 cases, $15,465; 47 cases motors, $6,364; 25 reels electric cable, $4,072; 150 trolley poles, $4,400; Manchester, 1 box motors, $172; Marseilles, 12 boxes, $65; 2 packages motor trucks, $930; 3 cases, $719; Mexico, 6 cases, $105; Moscow, 4 cases, $272; Naples, 3 cases, $806; Newcastle, 1 case, $4; New Foundland, 7 packages, $180; Nova Scotia, 1 box, $20; 1 case motors, $25; 26 packages, $260; Peru, 4 cases, $1,226; 9 packages, $187; Philippines, 2 packages, $30; Rome, 1 case, $20; Southampton, 29 cases, $2,869; 2 cases automobiles and parts, $2,775; U S. Colombia, 5 packages, $44; Venezuela, 38 cases, $390.

PERSONAL MENTION.

Mr. Harold Winthrop Buck, of New York City, was lately appointed electrical engineer for the Niagara Falls (N. Y.) Power Company and its allied interests, including the Buffalo and Tonawanda companies.

Mr. F. B. Fish, of Dayton, O., has been engaged by the Big Fork Electric Power Company of Helena, Mont., to plan and superintend the erection of its plant down at the falls of the Big Fork River.

Mr. Arthur H. Ford has been elected to the ad interim instructorship in electrical engineering at the University of Colorado, to take the place of Prof. George H. Rowe, who has been given a leave of absence for one year.

Mr. L. B. Stillwell, formerly electrical director of the Niagara Falls Power Company, will remove to New York City, where he will take full charge of the equipment of the electric railways of the Manhattan Railway Company.

Mr. George F. Sever has been assigned the task of arranging the multitudinous details in the development of the electrical exhibits at the Pan-American Exposition at Buffalo, N. Y.

COMING ELECTRICAL EVENTS.

American Electro Therapeutic Association—Will meet in New York City Sept. 25-27, 1900.

American Street Railway Association—Will meet in Kansas City, Mo., Oct. 16-19, 1900.

National Association of Municipal Electricians—Will meet in Pittsburg, Pa., Sept. 25-27, 1900.

Old-Time Telegraphers' Association and the U. S Military Telegraph Corps—Will meet in Minneapolis, Minn., Sept. 18, 1900.

Roentgen Society of the United States—Will meet in New York City Dec. 13-14, 1900.

Street Railway Association of the State of New York—Will meet at Buffalo Sept. 18-19, 1900.

INCORPORATIONS.

The Citizens' Electric Company, Clinton, Ill. Capital stock, $15,000. Incorporators: E. S. Nixon, T. Hinchliff and W. W. Newman.

The Cook Electric Company, New York City. Capital stock, $10,000. Directors: S. S. Cook and Martha A. Cook of Long Island City, David Mason of New York City.

The Leadville Gas & Electric Company, Leadville, Col. Capital stock, $200,000. Incorporators: John F. Champion, Robert B. Sullivan, Gilbert Wilkes and C. K. Boettcher.

ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U. S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

LETTERS PATENT ISSUED SEPTEMBER 4, 1900.

ELECTRIC RAILWAYS AND APPLIANCES.

657,132. Trolley-Track. Theodore C. Prouty, Midland, Mich. Filed June 5, 1900.

657,166. Elevated Trolley-Way. Edward C. Jones, Kansas City, Mo., assignor of one-half to Annie Means Morgan and Arthur G. Barnhart, same place. Filed Sept. 19, 1899.

657,170. Automatic Railway Signal-System. Jacob W. Lattig, West Bethlehem, Pa. Filed June 6, 1900.

657,180. Car-Fender. Richard F. Preusser, Washington, D. C. Filed Nov. 20, 1899.

657,213. Trolley. Joseph E. Connolly, Newark, N. J. Filed Dec. 5, 1899.

657,311 657,484. Closed-Conduit Electric Railway. Leon Dion, Boston, Mass. Filed March 6, 1899.

657,330. Electric Railway. Theophilus P. Chandler, Philadelphia, Pa. Filed July 27, 1900.

657,342. Trolley-Catcher. Frank J. Fairchild, Wyandotte, Mich. Filed Oct. 12, 1899.

657,487. Electric Railway System. Emmerich Frischmuth, Berlin, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Feb. 12, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

657,199. Electric Lamp for Dental Purposes. Byron E. Lawton, Providence, R. I. Filed Oct. 23, 1899.

657,432-657,433. Electric-Arc Lamp. Joseph Melzer, Cleveland, O., assignor to the Interstate Electric Company, same place. Filed April 2, 1900, May 2, 1900.

657,450. Electric-Arc Lamp. Irving R. Prentiss, Lynn, Mass., assignor to the General Electric Company of New York. Filed July 15, 1899.

657,485. Electric Arc Lamp. Thomas E. Drohan, Chicago, Ill., assignor to the Siemens & Halske Electric Company of America, same place. Filed Aug. 26, 1899.

657,502. Support for Electric Lamps. Willis A. Swan, Providence, R. I. Filed Jan. 6, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

657,159. Rheostat-Controller. John Dillon, Milwaukee, Wis. Filed June 4, 1900.

657,416. Speed-Controller for Electric Elevators. John D. Ihlder, Yonkers, N. Y., assignor, by mesne assignments, to the Otis Elevator Company, East Orange, N. J. Filed Nov. 27, 1897.

TELEPHONES AND TELEPHONE APPARATUS.

657,288. Telephone Transmitter-Arm. George R. Kennedy, Allegheny, Pa. Filed April 12, 1900.

657,305. Means for Relieving Telephone-Lines from Deleterious Electrical Charges. Chester H. Arnold, Boston, Mass., assignor to the American Bell Telephone Company, same place. Filed Dec. 22, 1899.

657,315. Telephone Switching Apparatus. David S. Hulfish, Chicago, Ill., assignor to the American Bell Telephone Company, Boston, Mass. Filed April 12, 1900.

657,316. Telephone Trunk-Circuit. David S. Hulfish, Chicago, Ill., assignor to the American Bell Telephone Company, Boston, Mass. Filed May 25, 1900.

657,338. Central-Battery Telephone System. William W. Dean, Chicago, Ill., assignor to the Kellogg Switchboard & Supply Company, same place. Filed April 28, 1899.

657,339. Plug and Socket for Telephone Systems. William W. Dean, Chicago, Ill., assignor to the Kellogg Switchboard & Supply Company, same place. Filed April 28, 1899.

MISCELLANEOUS.

657,090. Pneumatic-Despatch-Tube Apparatus. James T. Cowley, Lowell, Mass., assignor to the Lamson Consolidated Store Service Company, Newark, N. J. Filed March 23, 1999.

657,104. Method of Stringing or Supporting Electrical Conductors. Louis Hackethal, Hanover, Germany. Original application filed Dec. 20, 1898. Divided and this application filed April 20, 1900.

657,196. Submarine Cable. Theodore Guilleaume, Mulheim-on-the-Rhine, Germany. Filed Oct. 19, 1899.

657,202. Electric Furnace. Henry C. McBrair, Middletown, N.Y. Filed May 18, 1899.

657,211. Electric Lock. Henry G. Carleton, New York City, assignor to the Carleton Electric Company, same place. Filed Jan. 13, 1900.

657,218. Submarine Apparatus. August von Hoffmann, Munich, Germany. Filed Dec. 31, 1898.

657,221. Static Relay. Isidor Kitsee, Philadelphia, Pa., assignor to Charles E. Wilson, same place. Filed May 20, 1899. Renewed March 17, 1900.

657,222-657,224. Wireless or Space Telegraphy. Isidor Kitsee, Philadelphia, Pa., assignor to Charles E. Wilson, same place. Filed May 20, 1899, Sept. 18, 1899. Renewed March 12, 1900.

657,223. Receiving Device for Telegraphy. Isidor Kitsee, Philadelphia, Pa., assignor to Charles E. Wilson, same place. Filed May 20, 1899.

657,280. Phonograph. William Bohne, Toronto, Can. Filed March 20, 1900.

657,359. Thermostat. Henry E. Reeve, New York City, assignor to the Automatic Fire Alarm & Extinguisher Company, Limited, same place. Filed Nov. 15, 1899.

657,378. Roentgen-Ray Apparatus. William S. Andrews, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Jan. 20, 1898.

657,414. Fuse. Rudolf Hundhausen, Wilmersdorf, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Nov. 18, 1899.

DESIGN.

33,177. Switch-Lever for Electric Circuits. Edward S. Baldwin, Peabody, Mass., assignor to the Boston Pump Company, Boston, Mass. Filed July 16, 1900. Term of patent 14 years.

REISSUE.

11,852. System of Train Control. Edwin W. Rice, Jr., Schenectady, N.Y., assignor to the General Electric Company of New York. Filed March 16, 1899. Original No. 608,301, dated Aug. 2, 1898.

Digitized by Google

THE TELEPHONE WORLD.

President Eckert Explains.

The Knickerbocker Telephone & Telegraph Company, recently incorporated under the laws of the State of New York, has filed a mortgage for $5,000,000 on all its property, franchises and telegraph and telephone lines in this city and elsewhere that have been constructed or are to be completed. The mortgage was made in favor of the City Trust Company, and is given to secure an issue of 5,000 gold bonds of $1,000 each, payable in fifty years from September 1, 1900, with interest at 5 per cent. per annum.

The mortgage was executed by William H. Eckert and Arthur Phillips, as president and secretary, respectively, of the company.

Referring to the subject, Mr. Eckert said that the mortgage was without special significance and that it was intended to cover the rights and property of the company, so as to facilitate as far as possible the construction of its plant.

"We are going ahead with the work," said Mr. Eckert, "as quickly as possible, and are making favorable progress. It will probably take fully a year, however, to get all of our lines laid and in full operation. Although we have been at work now only about five months, we have our lines laid all over Queens, and we have done much work in the Bronx and in Manhattan. In Nassau, also, we have laid many lines.

"We do not contemplate any change in our plans as originally announced, and, all reports to the contrary, we are going right ahead with our work and will push it to completion at the earliest possible time.

"We have done little advertising and mighty little talking, but the work of laying our lines is being pushed all the time. The only difficulty we may experience may be in getting materials quickly enough.

"Our lines in Manhattan are not widely placed as yet, but in Queens, as far as the trunk lines are concerned, the work is almost complete. We will go ahead with the work in Manhattan as quickly as we can get the material we require.

"The Knickerbocker Company is an assured fact. It is here to stay. It is the only attempt at competition since the inception of the telephone, and we believe the public will appreciate it. We are already operating our Broome street and 23d street exchanges, though with a limited number of subscribers, and so may say we are a full-fledged working company. The work of testing cable is going on all the time and we mean to have everything up to date. We have experienced no special trouble in getting rights of way. We are asking for nothing that we are not entitled to.

"There is absolutely no truth in the reports that have been circulated to the effect that we are in the hands of a receiver and are not paying our bills."

The Union Telephone Company.

The Union Telephone Company of Plainfield, Wis., is one of the most flourishing of the small independent companies scattered throughout the country. The company was organized two years ago with B. B. Borden, president, and Frank R. Borden, vice-president. The company by furnishing good service at low rates has gradually built up its business until now it operates three exchanges, with no less than eight separate farmers' lines, and controls some 200 miles of toll line in five counties. The farmers' lines are quite popular, the farmers finding them a very great convenience in learning market prices and the probable state of the weather, the company telephoning the weather report to the farmers every morning. The regular subscriber rate is $8 a year, which is the lowest rate in the State of Wisconsin, and which goes to prove that a company can furnish excellent service for a price within the reach of all, notwithstanding statements to the contrary by some of the Bell companies. An official of the Union Telephone Company states that the cost of building the lines does not exceed $25 a mile, including poles, wire work and in fact everything pertaining to the line. The company would be pleased to hear of anyone building a good, durable line such as is owned by that concern for less money per mile.

According to the managers of the Binghamton (N. Y.) Telephone Company they expect to start the erection of the poles in that city shortly. The work done thus far has been confined to securing additional subscribers to the already large list. The question of getting a building centrally located is the main drawback to the work, and until that is done not much progress can be made with the work of installing the plant.

The Citizens' Independent Telephone Company has been organized at Oklahoma City for the purpose of constructing and operating an independent telephone system at that place. The capital stock of the company is $60,000.

A telephone line between Mountain View and Cordell, the new county seat of Wichita County, Kan., is proposed.

The Richmond Telephone Fight.

Another stage in the litigation so long drawn out between the city of Richmond, Va., and the Southern Bell Telephone Company was reached a few days ago when the latter corporation secured an appeal and supersedeas from the recent decision of the United States Circuit Court of Appeals.

The case now goes to the Supreme Court of the United States, and will be placed on the docket of the October term.

In its assignment of errors, filed with its petition for an appeal and supersedeas, the telephone company contends that twenty-one errors were committed by the Circuit Court of Appeals, and contends, among other things, that its lines were constructed under authority of statutes of the Commonwealth, with consent of the council of the city of Richmond, given by its ordinance of June 26, 1884, and that the city council did not by this ordinance (and could not as the State statutes then stood) reserve the right to require the removal of telephone lines from streets, upon which they might be constructed prior to a repeal of this ordinance.

The telephone company also contends that by section 1290, of the Code of 1887, the Legislature of Virginia took from the council of the city of Richmond all power (if any existed prior to that time) of repealing or revoking the right of the telephone company to maintain and operate its lines upon streets where they have been constructed by consent of the city council and upon streets designated by the committee on streets under the city ordinance of 1881.

The telephone company, therefore, claims that when relying upon the State statutes and city ordinance of 1884, it expended money and constructed its lines, a binding contract arose between the telephone company and the Commonwealth, as well as between the telephone company and the city of Richmond, protected by the Constitution of the United States, the validity of which cannot be impaired by any subsequent municipal legislation, and that the ordinances of the city of Richmond seeking to revoke all rights of the telephone company and requiring the removal of its lines from the streets of the city of Richmond, violate the vested rights of the company and violate the Constitution of the United States, which gives the telephone company the right to appeal to the Supreme Court of the United States, and to ask for the reversal of the decision against it for each of the twenty-one reasons stated in its assignment of errors.

The project for a new telephone company in Louisville, Ky., is beginning to take definite form. Mr. Robert E. Woods, who is the attorney for the promoters of the new company, referring to the subject recently said: "This movement is an earnest, genuine enterprise. The new company will start with a large number of subscribers, the rates will be very low and the service quick. There will be no such thing as two and three subscribers on one line, and there will be no pay stations, except at the hotels, for the use of strangers. Several other cities have recently opened the way for competing companies and everywhere it has proved a success." It is generally believed the council will grant a new franchise.

P. F. McClure of Pierre, S. D., has opened telephone connections with his breeding ranch several miles down the river from that place by attaching a wire from the city exchange to a barb wire fence along the railroad track, and making crossings by a small insulated wire laid in a gas pipe under the roadway. No effort was made to insulate the barb wire on the railroad fence, but the 'phone works as well as others on the system which are insulated.

Evan Shelly, of Lafayette, Ind., has invented a pocket telephone for use by police departments in larger cities. It consists of a receiver and transmitter, weighing altogether less than 17 ounces. By inserting a small plug in a little box attached to a telephone pole, automatic connection with the central office is secured. Tests between Indianapolis, Crawfordsville and other points demonstrate its practicability. Mr. Shelly is manager of the Lafayette Telephone Company.

The Union Telephone Company's line from Spartansburg, to Corry, Pa., has just been completed, and poles are in place for a line to Erie, Cleveland and several hundred towns in Ohio and northwestern Pennsylvania, as well as Greenville, Mercer and the entire system of the Mercer County Independent Telephone Company. Within a short time it is expected that the circuit will include Titusville, Oil City, Bradford and Kane.

The Schuylkill (Pa.) Telephone Company will introduce the central energy system. By this system it isn't necessary to ring for the exchange, but taking the receiver from its position calls up the exchange.

A Free Telephone.

The American people, says the "Globe" of St. Paul, Minn., have long been inquiring when that great agency of personal information, the telephone, would be made available for general use as a public agency. They have seen the invention outlive the operation of the patent laws, without any sign that the discovery would be made available for public use, save as the medium for enrichment of those engaged in its operation. Nor have they been able to discover any enduring signs that the invention would be restored to public ownership for many years to come.

Recently an experiment has been made of the use of a free telephone. It was in an inconsiderable town in Wisconsin. A free telephone station was established, placed in a prominent position, and the public invited to use it without let or hindrance. The result is accepted as a test of the utility of free telephone service, although it was an entirely unjust and partial one.

The telephone company, at the suggestion of the mayor of the community, established a free public station. It was placed in a booth at the intersection of two principal streets, on the sidewalk. At night the booth was lighted with electricity. Its interior contained nothing but a card of the subscribers and the instrument. Two or three months after the experiment was inaugurated it was declared to "have proved a popular success from the start."

But the sequel was not satisfactory. While the company's list of subscribers was increasing with remarkable rapidity, and the increase was generally regarded as due to the increased value of the telephone service to merchants by reason of the number of people with whom the free telephone brought them in communication, three months later the experiment was abandoned as a failure.

The reason for the failure, as declared by the company and the merchants was the abuse of the free service by certain irresponsible members of society who abused the privilege offered to them. "Youngsters and irresponsibles" had defaced the booth and used the instrument "recklessly and viciously, making telephone calls for mischief and worse."

The independent telephone companies are at present actively engaged in constructing lines in Clare, Mich., and vicinity, and very soon their service will be complete in every respect. The Union Company has completed its line from Clare to Farwell, connecting there with the Citizens' for Evart, Reed City and Ludington. Poles are being set for the line to Harrison, and later in the season a line will be built to Coleman, Midland and Bay City. Its lines are all full metallic and the public seems pleased with the service given. Clare will soon be the most important switching point in that section of the State for both the independent and Michigan lines.

The Virginia & Tennessee Telephone Company has made a conditional sale of its exchange and lines to the Wytheville (Va.) Telephone Company, the terms of which have not yet been made public. It is understood that if the service of the latter is satisfactory to the subscribers for one month, the sale will be consummated.

A Brockton, Mass., paper states that there is a rumor that the new telephone company, which was granted a franchise in that city, and which has since done nothing to indicate that it intends to avail itself of the opportunity given to build, may run up against a snag in the shape of a recommendation from the mayor that the franchise be repealed.

Work on the telephone line between Las Animas, Col., and La Junta was begun recently. The work has been delayed for some time owing to the inability of the promoters to secure suitable poles. When the line is completed Las Animas will be put in connection with every point touched by the Colorado Telephone Company's wires.

John I. Sabin, president of the Pacific Telephone & Telegraph Company, at San Francisco, Cal., has notified the board of supervisors of that city that sixty-three telephones now used by the police and fire departments will be discontinued. This action is the result of the appropriation for telephones having been cut from $15,000 to $7,000.

Arrangement has been made by which Kountze, Tex., will be connected with the outer world by a long-distance telephone.

TELEPHONE INCORPORATIONS.

The North Conway Telephone Company, North Conway, N. H.—to establish a telephone service. Capital stock, $5,000. Incorporators: C. E. Gibson, C. E. Poole, J. Z. Shedd, D. W. Barnes, A. Eastman, all of North Conway.

The Staunton Telephone Company, Springfield, Ill. Capital stock, $2,500. Incorporators: C. R. Wall, S. P. Williamson and C. Godfrey.

GENERAL NEWS.

What is Going On in the Electrical World.

LIGHTING.

Alliance, O.—City Engineer O. W. Pfouts is preparing plans and specifications for the new electric lighting plant.

Auburn, N. Y.—Arrangements are being made to have the overhead wires in this city removed and placed underground.

Barton Heights, Va.—This town will soon be brilliantly illuminated with electric lights. Bids will be asked from the Virginia Electric & Construction Company and the Richmond Passenger & Power Company.

Bay City, Mich.—An ordinance has been favorably reported to the city council giving to the Traction & Power Company of this city a franchise to erect an electric lighting system. The company is supposed to be the Consolidated Street Railway Company.

Bettsville, O.—The citizens of this place are talking of putting in electric lights.

Bronson, Mich.—This place expects soon to have a new $10,000 electric lighting plant to be put in by a private company.

Buffalo, N. Y.—The new electric light company has leased the power house of the street railway company for ten years. It will put in additional machinery and supply the railroad company with power, besides furnishing the arc lights for street lighting, and incandescent lights for commercial use. The service will commence November 1st.

Connellsville, Pa.—The Meyersdale Light, Heat & Power Company was sold recently for $20,000. The principal stockholder in the new company is Joseph Wolf of Braddock.

Crisfield, Md.—The Crisfield Ice Manufacturing Company has been granted a franchise to establish an electric light plant.

Ft. Scott, Kan.—The city council has decided to erect an electric light plant.

Hill City, Tenn.—The citizens of this place are agitating the question of building a new municipal electric light plant.

Houston, Tex.—The mayor of this city has decided to re-advertise for bids for building the electric light plant.

Kirkwood, Mo.—The building recently purchased by this town for an electric light plant, burned to the ground a short time ago. The fire will delay this considerably as a new building will have to be erected.

Macon, Ga.—The chamber of commerce is considering the question of municipal ownership for the electric light plant. G. A. Smith, president.

Madison, Neb.—This place is arranging to have an electric light plant.

Missoula, Mont.—This place is to have an electric light plant in the near future.

Monroe, Ind.—The board of trustees has decided to erect an electric light plant here.

Norman, Okla.—The city council will soon receive bids for lighting this town.

Olcott, N. Y.—This place will be lighted by electricity as soon as the electrical power plant at Newfane can supply the necessary current.

Portland, Me—The Portland Railway & Terminal Company will erect an electric light plant to cost $100,000.

Richmond, Ind.—The municipal electric light plant for this city will be a reality in a comparatively short time.

Roanoke, Ill.—The electric light plant lease has been bought by William Harting who will conduct the light franchise.

Shamokin, Pa.—The Shamokin-Edgewood Electric Light & Power Company was lately granted a charter. The company will build its plant within the next thirty days.

Shawano, Wis.—The citizens of this place recently voted by a majority of 232 in favor of putting in electric lights and waterworks.

Spencerville, O.—Bids will be received until September 15 for the erection of a municipal electric lighting plant at this place.

Syracuse, N. Y.—An electric plant will be installed in the St. Cloud Hotel, which will furnish electricity for many buildings in the same block.

Tarrytown, N. Y.—The new managers of the Hudson River Gas & Electric Company are improving the whole plant at this place.

Trinidad, Col.—This city is agitating the establishment of a municipal electric light plant.

Vineland, N. J.—The borough council has advertised for bids for the new municipal bond issue for $25,000 for an electric light plant.

Weiser, Idaho.—The board of trade is circulating a petition for a special election to vote on the question of issuing bonds for erecting an electric light plant.

West Branch, Mich—W. W. Vaughn will construct a dam and erect an electric light plant to furnish power to manufacturing plants in this vicinity.

Westerly, R. I.—C. B. Cottrell & Sons Co. of this town has awarded the contract for a new electric light plant to the New England Engineering Company of New London.

Windber, Pa.—A new electric light plant to cost $25,000 will be built here.

Windsor, Mo.—S. W. Garver will build the new electric light plant at this place.

Youngstown, O.—Options on the Youngstown Gas & Electric Light Company were recently closed by New York and Chicago capitalists and the transfer is to be made October 1. The consideration is half a million dollars.

STREET RAILWAYS.

Akron, O.—An electric street railway is to be built between this city and Canton. T. L. Childs of this city is the chief promoter.

Harpswell, Me.—At a recent meeting of the citizens of this place Eli Alexander, Samuel Dunning and T. E. Skolfield were appointed a committee to see how much money could be raised towards building an electric railroad from Brunswick by New York promoters. The meeting was unanimously in favor of the road and a New York company proposes to put one in if the Harpswell people will subscribe for enough stock.

Hudson, N. Y.—The Albany & Hudson Railway operated by the third-rail system, was opened to passenger traffic on September 6.

Huntington, W. Va.—The Ohio Valley Electric Railway Company has been incorporated with $1,000,000 capital stock to construct a street railway line from this city to Ironton, O. T. J. Ryan and H. S. Calo of this city are interested.

Ithaca, N. Y.—The proposed trolley road from this place to Auburn seems to be assured and the plans are assuming definite shape.

Jersey City, N. J.—Arrangements were made last week by Government officials with the officers of the North Jersey Street Railway Company by which trolley service will be utilized to transfer the mails between here and the towns in the northern and southern parts of Hudson County.

New Albany, Ind.—The New Albany Street Railroad Company has been granted a franchise to build, equip and operate an electric line.

Orange, Mass.—There is considerable interest in this town, and also in Wendell, Erving and Farley, in the proposed new electric railroad from here to Miller's Falls, constituting the connecting link from Greenfield to Boston after the Athol & Templeton road is completed.

Pana, Ill.—A recent conference, held between the promoters of the proposed Hervey City & St. Louis Electric Railway and the Business Men's Association, resulted in the appointment of a committee of citizens to investigate the matter, secure the right of way through the township, and raise the necessary bonus.

Philadelphia, Pa.—Fire destroyed the entire plant of the Philadelphia & West Chester Traction Company at Llanarch, which is about seven miles from this city.

Prospect, O.—An electric railway is to be built between Marion and this place.

Richmond, Ind.—It is said to be a settled thing that the two proposed electric railroads out of this city, for which franchises have been granted, will not be built before next spring.

Smethport, Pa.—A charter was recently issued by the State Department at Harrisburg to the Smethport Electric Street Railway Company of this place with a capital of $12,000.

Spokane, Wash—E. F. Gilpin has recently been in Spokane to complete arrangements to build an electric tramway 50 miles long from Grangeville to Buffalo Hump.

Two Rivers, Wis.—H. C. Higgins of Marinette, and Thomas Higgins, expect soon to have the franchises for an electric line between here and Manitowoc. They will build it as soon as they secure the rights of way.

MANUFACTURING.

Chicago, Ill.—A concern to manufacture electrical machines and appliances was recently organized here under the name of the Advance Machine Company, with a capital of $2,500. B. M. Davis, G. C. Travis and J. F. Larson, all have an interest in the firm.

Jersey City, N. J.—The Laconia Manufacturing Company was lately formed here to do a general electrical business, with a capital of $500,000. Among those interested are G. B. Morton, W. H. Carey, C. Sickelman, all of Jersey City.

Louisville, Ky.—The Central Electric Company, with $10,000 capital stock, in which J. S. Carill, B. M. Gelatt and W. C. Hines are interested, will manufacture electric supplies.

West Point, Ga.—The West Point Iron Works of this city wants a second-hand dynamo, about 25 lights.

COMPANY MATTERS.

Newark, N. J.—Papers increasing the capitalization of the Electric Enameling Company from $250,000 to $1,000,000 were recently sent to the Secretary of State. The head of the company, Charles H. Waterman, has patented a process for enameling electrically tiling, brick and all kinds of metals. It is the company's intention to build a factory in New Jersey soon.

San Antonio, Tex.—The Dubinski Electric Company of this city lately filed a deed of assignment in the county clerk's office.

POWER AND TRANSMISSION PLANTS.

Denver, Col.—The Telluride Power Transmission Company is building an addition to its plant, which will make it the largest electric plant in this State. Several mines in Ouray will be supplied with power from this plant, among them the Camp Bird, which, by the first of next year, will be equipped with a complete electrical plant, including electric drills, electric locomotives with a capacity for hauling 50 tons of ore, and electric motors for the operation of the mill. Everything about the mine and mill will be operated by electricity.

Gering, Neb.—A. L. Searles, of Chicago, is in this city for the purpose of furnishing plans and estimates for the proposed electrical power plant to be erected here.

New York City.—The Heniskayuna Power Company of this city was lately organized, to develop hydraulic and electrical power, on a capital of $100,000. Ernest C. Brown and L. J. Montgomery, of New York City, and W. A. Graves, of Rexford Flats, are interested.

MINES.

Colorado Springs, Col.—Lessee Baldwin has ordered an electric hoist to assist him in his development scheme. The company's workings on this property recently encountered one of the greatest ore bodies of the district, and the lessee believes his end to be equally prolific.

Walsenburg, Col.—M. D. Murray, superintendent of the McMillan mines at Sierra Blanca, lately completed arrangements for putting in an electric plant on the properties over which he has charge.

AUTOMOBILES.

Detroit, Mich.—At a meeting of the executive committee of the National Association of Street Railway Employes, held here September 7, President Mahon was instructed to draft a plan by which the local unions are to be assessed for raising a fund with which to purchase automobiles for use by the street railway men in the cities where the street railway men's strikes are in progress.

Philadelphia, Pa.—A charter was recently issued to the Automobile Construction Company of this city with a capital stock of $5,000.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16⅝c.; Lake, 16⅝@16¾c.; casting, 16⅜@16½c.

Calumet & Hecla directors have declared a dividend of $20 per share; the previous distribution was $10.

The Cincinnati Street Railway Company has declared the regular quarterly dividend of 1¼ per cent., payable October 1.

Stockholders of the Havana Electric Street Railway have voted to issue $1,000,000 second mortgage 6 per cent. 10-year bonds.

The Commercial Cable Company has declared the regular quarterly dividend of 1¾ per cent., payable October 1. Books close September 20 and reopen October 2.

Advices from Milwaukee, Wis., state that the Michigan tax commission proposes to increase assessed valuation of nearly all copper mines in Houghton County from 25 to 100 per cent.

The Westinghouse Electric and Manufacturing Company has declared a quarterly dividend of 1¾ per cent. on its preferred stock, payable October 1. Books close September 20 and reopen October 2.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 17@20; New York Electric Vehicle Transportation, 7½@8¼; New England Transportation, 3@3½; Gramophone, 35@40.

The two principal street railway lines in Fort Worth, Tex., have been acquired for $400,000 by the syndicate headed by J. B. Coffenberry, of Cleveland, Ohio, who announce that they will spend $1,000,000 in electric railways in that neighborhood

All the Chicago elevated roads show big gains for the month of August. The South Side shows 17 per cent. over last year, and the Metropolitan 16 per cent. Earnings of the Northwestern Elevated for August were $682,816. The Union Traction Company will show an increase of $10,766 for the month.

The annual stockholders' meeting of the United Electric Securities Company will be held September 13 at 1 P. M. at Portland, Me. Stockholders will be asked to amend the by-laws to provide for a change in the date of the annual meeting to the last Thursday of March, also making a corresponding change in the date for the beginning of the terms of directors and clerk. Transfer books closed August 31 and reopen September 14.

According to law September 2 was the last day for the Brooklyn Rapid Transit Company to file at Albany its annual report for the fiscal year ending July 31, but no such report was filed. C. D. McNealy, the secretary treasurer of the company, said that the report was too long and detailed to be ready. He said his impression was that the company had until September 15. "No report in previous years," he added, "has been filed on time, and nothing was done in the matter." The report will probably be ready in a week.

The Philadelphia "Stockholder" says: "There are a few people in the street who take a pessimistic view of the Electric Company of America stock, claiming that the position of the issue does not warrant any advance in its price. On the other hand, however, those close to the management, and, therefore, in position to get at facts bearing on the inside workings of the property, claim that the stock is selling entirely too low. It is understood that big money is being earned, and in view of this that the stock is an assured dividend payer."

The annual report of the operation of the Metropolitan Street Railway Company of New York and the report for the last quarter ending June 30, 1900, was filed at Albany on September 10 with the Railroad Commissioners. The report for the year ending June 30, 1900, shows the gross earning to be $14,721,550, an increase of $1,562,920 over last year. Dividends paid were $3,145,891, leaving a surplus of $214,269. Operating expenses are given as $7,104,607. In the report for the fourth quarter, ending June 30, 1900, the gross earnings are $3,849,354, an increase of $185,408. The total surplus is $927,509.

D. Houston & Co. in their copper circular say: England is doing an unprecedented business in copper and the same may be said of the Continent. English copper consumption for the first seven months of this year is estimated at 43,877 tons, or 19,836 tons more than for the same period in 1899. French consumption is returned at 28,391 tons from January to July inclusive, or 5,683 tons more than last year. Germany, however, appears to lead all foreign countries at present in the consumption of copper, where for the first six months of this year 39,696 tons of imported copper (pyrites not included) was the quantity consumed as per official returns. This was 8,034 tons more than for the first half of last year. European demand is a factor of the greatest importance and the foreign consumer is now the principal customer for the product of the American copper mines. During the past four years and seven months ending July 31, 1900, this country has produced 1,064,077 tons of fine copper, and exported during the same period 621,636 tons fine.

The Boston "News Bureau" says: Results of the operation of Manhattan Elevated Railway for the year ended June 30, 1900, agreed very closely with those of the previous year. Maintenance of way and structures showed a decrease of about $20,000, chiefly in repairs of roadway and in repairs and renewal of buildings. Maintenance of equipment decreased about $27,000, renewals of locomotives cost less and renewals of cars more than in the previous year. Wages of engineers and firemen were $902,461, against $863,772. There was a very decided increase in the cost of fuel, the cost being last year $825,638, compared with $772,585 the previous year. The item of train service was nearly the same, also the cost of train supplies and of switchmen, flagmen and watchmen. Station service cost $497,618, against 496,462. An important saving was effected in the legal expenses, which amounted to $105,191, compared with $133,376 the previous year. It is somewhat surprising that the land damages paid by Manhattan continue to show increases. The cost last year was $1,234,878, compared with $1,140,589 in 1899, $864,449 in 1898, $800,281 in 1897, $952,296 in 1896 and $859,671 in 1895. The item of damages ought to begin to decrease after over 20 years of operation of the road, but the contrary seems to be the case.

EDITORIAL NOTES.

Journalistic Amenities.

The too vivid imagination of an enterprising reporter has furnished an opportunity for Brother Martin of the "Electrical World and Engineer" and for Brother Price of the "Electrical Review" to sit up and prate like two wise-looking but empty-headed parrots in a zoological garden. We refer to the articles which appeared in our worthy contemporaries on September 15 and 12 respectively, on the lighting of San Juan, Porto Rico, which is referred to more specifically on page 163 of this issue of Electricity.

After scanning the pages of the San Juan paper in which the utterly absurd and preposterous alleged utterances appear it would have shown good taste, to say nothing of a due regard for news accuracy, on the part of Mr. Martin and Mr. Price to have called on the parties quoted for some explanation of the matter before rushing headlong into print regarding a subject of which they knew little or nothing. Mr. Martin very magnanimously omits mentioning any names, and to be on the safe side generously intersperses his attempts at sarcasm with such qualifying phrases as "is said" or "is alleged," of "dubious origin," etc. Mr. Martin might have saved considerable of his valuable time and employed it, for instance, in thinking out a nice little after-dinner speech, had he only taken the trouble to inquire the facts of the parties concerned. He apparently preferred, however, to get at the facts "afterwards," and in this he shows the influence of his recent sojourn abroad, in placing, as the French do, the cart before the horse.

Mr. Price does not apparently believe in mincing matters, for he publishes the alleged cablegram in full with all the names and frills that went with it. What has been said regarding rushing headlong into print regardless of facts also applies in this instance to the "Electrical Review." But we are not surprised at anything the "Electrical Review" might do of this nature, as this is not the first time that that worthy publication has placed before its readers inaccurate statements, which it has even refused to retract or rectify when shown to be wrong. The "Review" article says that probably the parties quoted were "misrepresented or that they forgot something." The quotation marks are ours. This is extremely charitable on the part of the compiler of the article, but if something has been forgotten it is by the Editor of the "Electrical Review," and is what is commonly known as journalistic courtesy. Had the facts of the case been ascertained of course the article would have been worthless and would have had to have been omitted and something else substituted, and as matter even in the "Review" has occasionally to be paid for it was a case of "where ignorance is bliss 'tis folly to be wise." Judging from the paragraph before the last of the "Review" article, Mr. Price in his overwhelming egotism apparently considers that he is the only well-known and responsible "electrical engineer" and editor in the United States. As Shakespeare said "It is to laugh!"

* * *

The Work of the National Electric Light Association.

It is scarcely necessary to call the attention of the electrical fraternity to the excellent work that has been and is being accomplished by the National Electric Light Association. The work of the special committees of this Association, has done much to elucidate and straighten out intricate problems, and only last year the report on the "Photometric Value of Arc Lamps" was of a high order, and a credit to the gentlemen who had the matter in charge. The Association is also at work endeavoring to bring about, by drastic measures, if necessary, a much desired change in the present freight classification of electrical apparatus.

These and other good works of the Association are necessarily handicapped by a lack of funds, for, as is well known, the revenue of the Association is derived solely from the membership dues. With a view therefore to strengthening the Association, and thus enabling it to put forth its best efforts for the benefit of the electric lighting industry in general, President J. B. Cahoon has sent out the following letter to central stations that are not members of the Association:

"The work of the National Electric Light Association has broadened to such an extent as to be of vital interest to every electric light company in the country, and we are now confronted with great problems demanding an ample supply of funds for their proper solution.

"The work of our Committee on Photometric Value of Arc Lamps has been of a remark-

Digitized by Google

ably high order, and to carry it to its logical conclusion will require an increased fund.

"The Association has taken an aggresive stand against municipal ownership, and is daily helping companies, particularly small ones, in their fight for existence. Companies not members of the Association do not hesitate to appeal to us for help when attacked, yet seem to think that we should go to the expense of collecting and preparing data for their use without expecting them to help foot the bills.

"The Association has now in hand the preparation of a complete and uniform system of accounting: is preparing to fight the present unjust freight classification of electrical apparatus: is engaged in the collection of data of vital interest, and is doing much other work that will benefit you as well as our members. The time has come when, in order to broaden still further our sphere of usefulness, we need your active support and co-operation. To become a great power for the safeguard and welfare of our members, and to present a strong front and successfully beat back the wave of municipal ownership now rapidly extending over the country, we must unite for the common defence. I therefore ask that you do your share by joining the Association: not at some time in the future: when it may be too late, but *now*. The annual dues are so small—only $25—that there is not an electric light company in the country but can pay them and not feel it. A brief letter of application, with check, is all that is necessary. Will you not send this in at once?"

This letter, which admirably sets forth the good work the Association is doing, should and undoubtedly will meet with hearty response from the central stations that have not as yet joined. The benefits to be derived are by no means inconsiderable, and the necessary reforms that need to be brought about in order to benefit the industry as a whole, can only be successfully accomplished on the basis of the old saying, "together we stand, divided we fall."

* * *

American Capital to Furnish Londoners With Transportation.

Last month we referred in these columns to the fact that Mr. Charles T. Yerkes, the well-known street railway financier and promoter, was in London with the object of consolidating the various surface and underground lines in the English metropolis into one enormous system. It now seems that the entering wedge has been driven in and that Mr. Yerkes is in a fair way to ultimately accomplish in London what he so successfully carried out in Chicago. According to a cable dispatch to the daily press Mr. Yerkes has purchased the charter of the Charing Cross & Hampstead Railway for $500,000, and will shortly begin the construction of some six miles of underground railway to be operated when completed by electricity. This initial project will cost, so it is claimed, $20,000,000, which will be exclusively American capital. It is proposed to make this the nucleus of a system of underground and surface railways, which will afford London the facilities for rapid transit—something it has sorely needed.

Mr. Yerkes' railway will be the first important engineering undertaking of the kind on the other side of the Atlantic. The dispatch says that the former king of Chicago street railways "did not come to England to float a company and then unload it on English investors. He is in London not as a promoter but as a builder and investor."

He believes that a fortune is waiting for the man who can weld London's hodge-podge of tunnels, tramways and 'bus lines into a homogeneous electric system, and he wants to be that man.

When the Charing Cross & Hampstead Railway has been built it will be found that Mr. Yerkes is the largest individual owner, and the greater part of the remaider of its capital will be subscribed by Americans who have been associated with Mr. Yerkes in railway enterprises across the Atlantic.

Charing Cross is the center of London. Distances are measured from it as they are from the City Hall in New York. There the London, Chatham and Dover and the Southeastern railways terminate. It is the door through which travelers from the Continent enter London.

The idea of connecting this railway center with the terminal stations of the railways from the North, the London and Northwestern, the Great Northern and the Midland, was conceived by the Southeastern before its consolidation with the London, Chatham and Dover. The necessary charter was obtained from Parliament, but the project was dropped after the amalgamation of the Southern railways.

It was from the Southeastern directors, who obtained the charter from Parliament that Mr. Yerkes purchased the rights.

He will build a tunnel north from Charing Cross road to Tottenham Court road, where a loop will run around Euston station, under Drummond and Seymour streets, and connecting again with the main tunnel under Hampstead road.

From there the tunnel will run off to the northwest, under High street, Camden town, from which point a branching tunnel will connect the main line with the Midland Railway station at Kentish town.

Then it will pass under Chalk Farm road, Haverstock Hill and Roslyn Hill, to Hampstead Heath.

There, on the heights, overlooking all London on one side and the rich farms of Middlesex on the other, Mr. Yerkes will build a terminal station, not far from the famous Jack Straw's Castle, the olden time retreat for highwaymen who made raids on Londoners down in the valley.

Like the new Central London Underground the railway from Charing Cross to Hampstead is to be built in two tunnels.

Sir Douglas Fox, president of the Institute of Civil Engineers, and Mr. William Robert Galbraith have been appointed engineers of the railway, and Mr. R. W. Perks, M. P., its solicitor.

While English engineers will have charge of the construction, Mr. Yerkes' railway will be American in make. The electric power house and electric construction throughout will be American.

Mr. Yerkes is already taking steps to obtain other charters from Parliament for the construction of railways connecting with the main line.

The strangest part of the situation is, judging from the tone of the British press, that Londoners are so anxious for up-to-date means of transportation that they are willing to accept it on American plans and at the hands of an American promoter, provided only that the antiquated lumbering busses, now extensively in use, are ultimately done away with.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

The coal strike which is now in full swing in Pennsylvania, and which involves the idleness of some 100,000 miners, if protracted should seriously effect many electric lighting plants throughout this section of the country. The price of fuel will be bound to go up several dollars a ton, which would be a very important matter. It is to be hoped therefore that the questions at issue may be settled by arbitration.

The Babcock & Wilcox boilers have been awarded the Grand Prix at the Paris International Exposition of 1900.

It is claimed that electricity has made enormous progress in Japan during the last few years. In 1899 the country possessed no less than 26,453 kilometers of telegraph with 1,342 stations. The capital, Tokio, is now lighted by more than 60,000 electric lights.

An up-to-date electric ambulance service has been added to Roosevelt Hospital in this city, consisting of two electric rubber-tired automobile ambulances, able to travel 16 miles an hours, each weighing 4,800 pounds and costing $3,000 apiece. They are gifts to the hospital, one that of a prominent physician of this city. The new ambulances are provided with brakes which Lucius T. Gibbs, the designer, declares will bring them to a dead stop within six feet while running at full speed. Similar ambulances are being made for the New York and Presbyterian Hospitals. St. Vincent's already has an automobile ambulance.

According to a report a prize of 1,000 francs is waiting for the inventor who shall produce a glove that can be used by electrical workmen to safeguard them from accident. The premium is offered by the French Accidents to Workmen Assurance Association, and the conditions are: That the gloves must cover the forearm as well as the hands: that they must be light and leave the utmost liberty to the fingers. If one specification does not come up to the required standard the prize will be divided among the inventors who most nearly approach it, the decision being left with a special commission nominated by the Association.

General Greely, chief signal officer, who went to Alaska to arrange for telegraphic communication with that territory, reports that by using the Canadian line there will be communication with Fort Egbert, Eagle City, by the end of September. The Canadian line extends from Ashcroft north to Dawson City and the boundary. The United States has constructed a line from Fort Egbert to meet this line. Another one is being built by the United States up the Yukon River, which it is intended shall connect with Fort Egbert, but it is not likely that it will be completed this season.

The municipality at Blackburn, England, proposes to borrow about $980,000 for extending the electric plant of that city. A. S. Giles is the electrical engineer. As American electrical material is extensively used in British undertakings the prospects are that the engineer in charge will begin to make inquiries soon after the above-named amount is obtained.

Digitized by Google

IT is reported that the Santa Fé railroad will soon inaugurate a new idea for the electric lighting of passenger coaches. About two years ago this company equipped 100 passenger cars with an axle lighting system and a thorough trial was given the device but was found not to be sufficiently reliable to warrant its use on trains. The officers have now decided to remove the old axle device and make a trial of a greatly improved axle lighting system. Twelve cars will be equipped with the new apparatus, and when complete the test will begin, and will be in continuous service for six months. The cost of equipping with the new axle system is $750 per car.

A MEDAL has been awarded the Chicago Fuse Wire & Mfg. Company by the International Jury of Award for the exhibit of that company at the Paris Exposition. The exhibit consisted of a complete assortment of "Trade Mark" tested fuse wire and fuse links.

THE instant success of the moving stairway or inclined elevator at one of the elevated railway stations in this city, says the N. Y. "Commercial Advertiser," is hailed as a delightful surprise, as if there were something experimental about the invention. As a matter of fact there has been no doubt whatever about the practicability of this and simliar devices for several years past. If the elevated railway company had chosen to place them at all its stations long ago its loss in traffic would have been far less serious than has been the case. Most persons, and all ladies, dislike stair climbing under the best of conditions, and detest it in the case of the elevated stairways, which are never clean and often filthy. If the company were to replace these objectionable methods of approach with elevators of any kind, there is no doubt that it would secure at once a great increase in its volume of traffic. Its refusal to do so is in accordance with its general policy of making few improvements, no matter what the demand might be. With moving stairways and electric traction the elevated lines would suffer far less from surface competition than they do at present; and this fact is no more obvious to-day than it has been every day for five years or more.

AN invention has recently been brought out in England by means of which "lost chords" in music are to be prevented. In the London "Globe" it is announced that a Mr. Vaughan Neale has completed an electrical machine which is to register extempore compositions upon the piano. The arrangement can be attached to any ordinary piano, and it is reported that the machine has taken down a tarantella played at the rate of 2,000 notes a minute. The attachment, it is stated, does not interfere with the touch.

ELECTRIC toys will be all the rage for Christmas presents this year if dealers in such things have forecasted the popular taste in the right way. Many of them were sold last year, but fathers and mothers were still nervous about the danger of possible shocks. The efforts of the inventor have been directed toward turning out toys that cannot possibly transmute the slightest current, and the clerks will be able to guarantee perfect safety. Many of the electrical toys are fitted with connections for stealing power from the electric light wires, which does away with dry and wet batteries, and will make parents less nervous about the danger. One of the newest electric toys is an automobile cab in miniature. It has batteries between the wheels, rubber tires, cushioned seats and nickel steering gear. In it dolls can ride around the dining-room table or parlor floor, and absolutely without danger, unless the speed becomes too great. An electric torpedo boat with a storage battery capable of running it at a high rate of speed will be another popular toy. The torpedo boat is an exact model of some of the smaller boats used in the navy, and has enough air-tight compartments to keep it afloat should some parts chance to fill with water. The steering gear can be set at any desired angle, and the boat will circle park ponds for an hour at a time. A submarine boat will be the next thing demanded by Young America, now that the Holland is proving a success.

THE line of telegraph from the coast to the Lake Victoria Nyanza in Africa has recently been completed, and the advantages which it will confer on the inhabitants of Lower Egypt will be enormous, says the London "Electrical Engineer." As is well known, the natives depend on the rise of the waters of the Nile for the irrigation of the land, and hitherto they have only known a very short time beforehand the condition of the waters. Now, however, that communication has been made from the sources of the Nile, the required information can be sent several months in advance, and the Egyptians can regulate their supplies. Messages, also, are now sent in a few days, which previously took seven months to communicate.

ONE of the most interesting and difficult feats in the history of railroading is to be carried out in Southern California by the interests owning the Los Angeles Railway. Since the owners of this corporation (the Huntington syndicate) acquired the Mount Lowe Railroad, their engineers have been at work upon plans and surveys for the improvement and extension of that picturesque and unique line. Plans are now completed for straightening the line from Altadena to the base of Echo Mountain. But the most interesting part of the story is contained in the following statement of General Manager C. W. Smith: "Ultimately a trolley road from the top of Echo Mountain to the Alpine Cavern will be extended across the ridge and up to Wilson's Peak. We have found it is perfectly feasible to carry this road to the summit by way of Martin's Camp, and it will surely be done." A trolley ride along the top of the Sierra will be an exhilarating excursion. There will be nothing like it elsewhere in the world.

FRANK LOOMIS, United States Minister to Venezuela, lately arrived in Washington on leave of absence from his post. Mr. Loomis says that commercially there has been a great improvement in affairs in that country. Among the American enterprises under way is the erection of an electric light plant at La Guayra to light Caracas by long-distance transmission of power.

MORE than $100,000,000 worth of india rubber has been imported into the United States during the past four years, and more than $60,000,000 worth in two years. Ten years ago the annual importations of india rubber amounted to about $15,000,000, now they exceed $30,000,000 and are steadily increasing. Almost all the rubber imported comes in a crude form for use by manufacturers, who are constantly extending its application to various new lines of industry. Northern Brazil, Southern Mexico, the West Indies, Central Africa, India, the Straits Settlements and the Dutch East Indies supply this article, which has no equal for rapid growth.

INQUIRIES from Italy for electric machinery and material continue to arrive in greater proportions than from any other part of Southern Europe. According to an electric engineering firm of this city their average weekly shipments to leading ports of that country reach all of $15,000, and recently they secured a contract at Catania which will necessitate the taking of upwards of $30,000 worth of material and machinery to that place. In mechanical development equally as good opportunities are said to exist in Italy, but they are taken advantage of by European firms because little attention is given to direct business by Americans.

THE LIGHTING OF SAN JUAN, PORTO RICO.

My attention has been called to the issues of August 21 and September 1 of the San Juan "News" of Porto Rico, in which I am credited with having made a number of statements to a representative of the N. Y. "Sun," regarding the lighting of San Juan by means of a high tension electric lighting system. I beg to say right here that the statements credited to me are false from beginning to end with one exception. The whole story of the matter so far as the writer was concerned is as follows: A representative of the N. Y. "Sun" called at my office and asked if I could refer him to some one from whom he could get an opinion on the lighting of San Juan by means of a high tension electric system. I referred him to Mr. Newton Harrison, editor of the "Electrical Age," knowing that in all probability Mr. Harrison would give him a conservative opinion on the subject.

The "Sun" representative then asked if I would offer an opinion on the subject myself, to which I replied that I would rather not, not knowing the circumstances, local conditions, etc. This statement, which appears in the alleged interview, is the only one by the way that is correct.

The reporter then said that it was proposed to string high-tension wires across the roofs of the houses, and inquired if I did not think they would be apt to cause accidents especially in a town where most of the inhabitants spend a large portion of the year on the roofs. In reply to this, I said that under the circumstances high tension overhead conductors might be more or less conducive to accidents, but I said nothing about such a course of procedure being a crime or murder, as reported in the San Juan paper. This was the sum and substance of the alleged interview, which some one cleverly, but unjustifiably, manipulated to suit his purpose. It will be seen that I neither opposed nor recommended any system of lighting for San Juan, neither did I state that all the wires should be placed in conduits in that city.

W. L. HEDENBERG,
Editor ELECTRICITY.

THE SLABY-ARCO SYSTEM OF WIRELESS TELEGRAPHY.*

The Slaby-Arco system, as described in a pamphlet issued by the General Electric Company of Berlin, though based on essentially the same principles as the Marconi system differs from the latter in some important respects. The vertical wire for example which is insulated in the Marconi arrangement, is in the Slaby-Arco system connected with earth for both transmitting and receiving.

The connections of the transmitting apparatus are shown in diagram 1. A condenser, C, is charged with high tension electricity by the induction coil, J, and discharges itself on one side through the spark-gap, F, and the transmitting wire, and on the other side

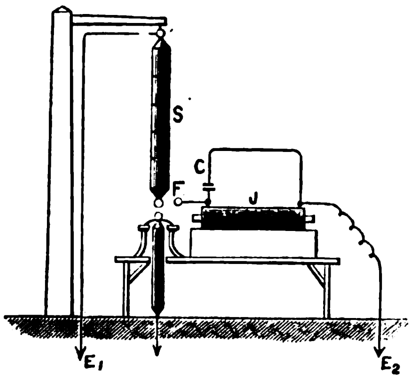

Diagram 1.

through E_2, direct to earth. According to the inventors the technical advantages of this arrangement are very decided, for as only one of the condenser plates and one knob of the radiator parts which can be permanently insulated, and from which danger to the operators can be completely prevented—are at a high potential relative to the earth, difficulties of insulating the transmitting wire are obviated; and even on taking hold of the wire scarcely perceptible shocks are felt.

For the production of the high potential the inventors ordinarily use a 40 or 50 cm. induction coil with a mercury turbine contact breaker; the coil may be directly connected with an

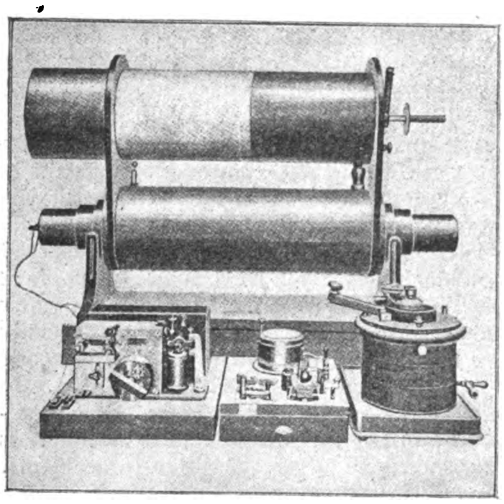

Fig. 1.

electric light circuit, thus dispensing with accumulators or dry cells. The use of a special Morse key is rendered unnecessary by a suitable appliance fitted to the turbine contact breaker. If an alternating current is available the arrangement becomes still simpler and more convenient, since in that case the contact breaker can be wholly dispensed with, and the induction coil can be directly connected with the alternating current circuit. The condensers used are made of "micanite," and are mounted on the induction coil itself, this being done in such a way that the high tension pole of the induction coil and of the condenser is protected from contact. (See Fig. 1.)

The arrangement of the receiving apparatus is shown in diagram 2. In this figure S is the aerial wire netting, F the coherer, R the relay of the Morse instrument, and B the battery.

The action of the receiver is such that, when the initial high resistance of the coherer has been reduced by the etheric waves, the battery, B, is enabled to send a current through the relay, the aerial wire, and earth.

It is a characteristic feature of the receiving apparatus that the pulsating magnetic field produced by the transmitter may be received not only on a simple aerial wire, but also on an earthed wire cage or netting, whereas in previous arrangements the waves which reached the coherer, F, were shunted by the local circuit, and their effect was thereby weakened; in the Slaby-Arco system the series arrangement adopted completely removes this defect; atmospheric disturbances are also greatly diminished by the series arrangement.

Another improvement in the receiver consists in the introduction of an automatic interruption of the coherer circuit. Matters are so arranged that the blow of the tapper is only given to the coherer tube after the tension of the coherer elements is taken off. By this means not only is easy and satisfactory decoherence effected, but the life of the coherer is said to be considerably prolonged, since the

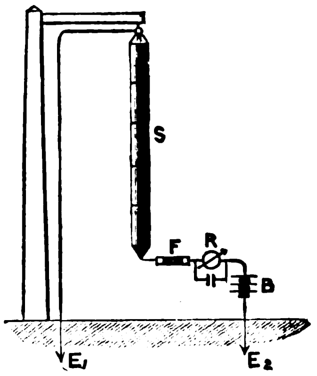

Diagram 2.

sparks on breaking circuit, which would otherwise occur in the interior and would gradually destroy the coherer powder, are caused to take place externally.

A further improvement is claimed in the construction of the coherer, a variation in the sensitiveness of which is rendered possible by means of hermetically sealed leads. The coherers are all tested for long distances, but each receiver for movable stations is furnished with an appliance for diminishing the intensity, so that the apparatus, in spite of its great sensitiveness, will work perfectly even at very short distances.

It is claimed that the system is particularly useful for communications between ships at sea or ships and the coast, and that experiments carried out by the German navy prove that for such purposes the system is perfectly reliable.

At present the radiating power and sensitiveness of the apparatus is such that signals can be safely transmitted to distances of 25 to 28 miles over sea with vertical wires 38 to 44 yards high.

On land the General Electric Company maintain communication between their cable factory at Oberschoneweide and their central office in Berlin, a distance of 9¼ miles. The vertical wires, about 55 yards high, are supported by two tall chimneys.

The advantages of the Slaby-Arco, system, as compared with other systems, consist, it is stated, not so much in its superiority in respect of the distances, as in its practical serviceability, prevention of danger from high pressures, avoidance of difficulties of insulation in the transmitter, and of atmospheric disturbances in the receiver, together with a greater solidity and simpler manipulation of the

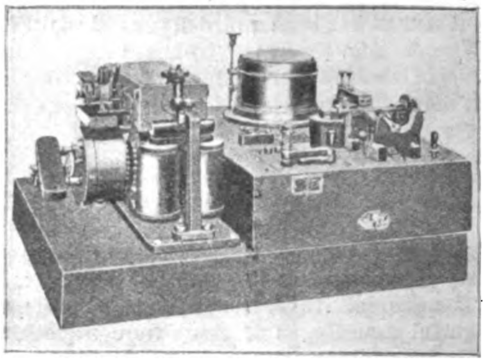

Fig. 2.—Receiving Apparatus.

whole receiving apparatus. It is for these qualities that the system has been adopted by the German navy.

Short vs. Long Filaments for Incandescent Electric Lamps.

With the increase in the working voltage at which incandescent electric lamps are run, the problem of the production of the filament that will give the proper amount of light at a reasonable efficiency, and with a reasonable length of usual life, has become a serious one. In order that the filament shall do its work properly with a high voltage, say 200 volts, as against 100 volts, or even 50 volts, it must be made longer in proportion to the pressure, and is therefore necessarily weaker. Of necessity it is also of smaller cross section, as it has to be raised to the same temperature as the lower-voltage lamps, with half or quarter the current strength that is passing through them; hence it is doubly weak. Two methods have been adopted in dealing with the problem. In one form of lamp the filament is made the full length and turned into a curl, but otherwise unsupported except at the ends where it is joined to the platinum wires which deliver the current to it. The other method is to make the filament in two or three pieces, each supported at its ends, and to deliver the current to each piece. This latter method again has two variations. The positions of the filament may be connected in series, as the cells of a signal battery are connected, the pressure being only applied to the outside ends of the two, one end of each; or they may be connected in parallel, just as incandescent lamps are connected to a supply service, each end of each filament being supported and connected to the platinum wires, which again are connected to the supply wires. One American firm of lamp makers claims considerable advantages for the parallel method, but in the writer's opinion it is very doubtful if the claim is justified, though American electricians have shown themselves very skillful in the manufacture of incandescent lamps. In order that the parallel method

Digitized by Google

may be adopted, it is necessary that the lamp filaments shall be reduced still further in sectional area, and consequently they are all still weaker than the filaments that are connected in series. In addition, there is some doubt as to the wisdom of having more points of entrance for the current than are necessary. Wherever a break in the continuity of the electric circuit takes place, the current produces the effect that the conductor on each side of the break becomes very brittle, so that one would expect filaments arranged in this manner to break off rather frequently at the points of junction. The brittleness mentioned above may be noticed in the connections of telephones, bells and similar apparatus, where comparatively small wires are used. With the incandescent lamp the action is intensified by the expansions and contractions which take place in the filament between the temperature of full light and that of no light—"Colliery Guardian," London.

AUTOMATIC BLOCK SIGNAL FAILURES DUE TO LIGHTNING *

BY H. D. MILES,

Signal Engineer, Michigan Central Railroad.

There are two kinds of failures of automatic signals due to lightning, the failure of signals to clear and the consequent delay to traffic, and the failure of signals to go to danger, and the consequent imperiling of safe train movements. Three years ago the efforts of signal and railroad companies were directed to the abolition of the latter evil, and I believe that I am within the truth in saying that it is possible now to prevent (except possibly in rare instances) lightning or any high potential foreign current causing the false display of clear signals. To-day the problem is how to avoid the other evil, namely, the setting to danger of automatic signals due to the action of lightning currents. The introduction of the carbon contact for relays and their use in combination with fuse wires has solved the first problem. A lightning arrester which will take care of the heavy discharges without opening the circuit, combined with the use of carbon to prevent the fusing of relay contacts by so much of the lightning current as may pass through the arrester, is the device apparently which must be employed to solve the second problem. I believe that it is too early to say that the solution of the latter has been accomplished, nevertheless the service rendered by the choke-coil lightning arrester encourages the belief that it or some better device will accomplish what is desired. The fuse wire is the chief agency of our present woes, and until it is dispensed with, the block signal maintainer is sure of an abundance of calls during the lightning season.

The only utility of fuse wires where carbon contacts are employed is to protect the relays and signal instruments from the heavy lightning currents; if these can be diverted to the ground before reaching the instruments the problem will be solved. It is possible that the railroads, through over cautiousness, have made too free use of low capacity fuse wires. A great many one-ampere fuse wires are blown by currents which would not injure the instruments were no fuse wires used. Feeling that a brief history of the steps taken by the Michigan Central to overcome the difficulties mentioned might be of interest to some, I will endeavor briefly to explain what has been done in the past and what it is proposed to do on an installation of 15 miles of double track blocking which is to be installed in Canada this fall. The Michigan Central has not been subjected to unusual conditions, nor has it applied any untried devices to overcome the difficulties. The interest, if any, must be found in the number of patients cared for and the effects of the remedies prescribed. One hundred and forty-six miles of double track blocking is in use, and a fair amount of lightning is allotted to this territory each year. One hundred and thirty-six miles of this blocking is controlled by the track circuit, the remaining eight miles by the track instrument system.

Previous to 1896 the Michigan Central had 31 miles of automatic blocking in service, a little more than half of which was controlled by track circuit. Practically no trouble was had with the track instrument system as the line wires did not lead to ground or come into close proximity with grounded circuits. The signals controlled by track circuit were affected some, but as the line wires were mostly confined to the over-lap section, and as few lightning storms passed over this territory during the two years in which these signals were in service prior to 1896, the difficulties experienced were so few that the lightning question was considered of little importance. During the summer and fall of 1896, 110 miles of the track circuit system of automatic signals were installed, but were put in service so late in the year that it was not until the spring and summer of 1897 that the importance of the lightning problem was realized. On this installation indicators were used at all main track switches and the consequent long lines of overhead wire, necessitated by the introduction of the indicators, aggravated the difficulties. The first arrester used to prevent the fusing of contacts and the burning of magnet coils was the old-style saw-tooth type, the ground plate being connected with the relay wires which led to the rails of the track. The lightning currents which fused the relay points did so on account of the path afforded through the track relay, track wires and rails to ground, and as the air gap between the contact strips and ground plate of the arrester was less than that between the armature and magnet coils of the track relay, it was naturally inferred that high potential currents would take the path of least resistance and thus avoid fusing the contact springs. The service rendered by this form of arrester, even when combined with fuse wire protection, did not prevent the fusing of platinum contact points, and consequently these arresters were abandoned in 1898 and carbon contact strips and ground plate arresters having a high resistance substance for making contact between the ground plate and the contact strips, which were connected to the track and line wires, were substituted. One-ampere fuse wires for track and two ampere fuse wires for line circuits were used in connection with these arresters, the ground plates in this case being connected with galvanized iron pipe driven in the ground, experience having proven that the use of the rails as grounds increased the number of signal failures.

To further guard against the danger of fused points, carbon points were used in relays to control all line circuits and the Buchanan back contact shunt was applied where track circuits were controlled, in order to shunt the track battery should the front contact fuse. It was considered impracticable at that time to use contact points made of carbon for controlling the low potential track currents, on acount of high resistance of that substance. Since these alterations were made there has not been a single case of a signal being held clear by fused contacts, although many instances have occurred of the signals being held at danger on account of blown fuse wires; for instance from January 1 to August 20, 1900, 36 per cent. of the failures of signals to clear were caused by lightning, and nearly all of these failures were due to blown fuse wires. In 1899 five miles of the semaphore type of automatic signals were installed, carbon contacts being used to control all circuits, and 2½ ampere fuse wire and choke coil lightning arresters being used in all line circuits, no safeguards other than carbon contacts being provided for the track circuits. In this instance the arresters, instead of being in the relay boxes, were located in cast-iron boxes on the telegraph poles.

Two types of choke-coil arresters are employed. In one the coil of wire is wound on a hard rubber spool or cylinder, in the other the wire is wound on a porcelain spool having a hollow center in which is inserted a soft iron core. The Hall Signal Co. claims, from a series of tests made with a high potential current, that the simple choke-coil arrester discharged about 54 per cent of the current to ground, while the iron core coil discharged 95 per cent. of the current to ground. I believe the theory being that the iron core offers an additional retarding effect to the flow of the current, thus causing it to discharge more freely to the ground plate. On this latter section of blocking no signal failures have occurred due to lightning since this installation was completed, although lightning troubles have been experienced both east and west of this section of blocking, and the porcelain spools of three of the arresters have been shattered by lightning. It is too soon to judge of the efficiency of this method of protection, but as there are line wires throughout each block and several lightning storms have passed over this section, the inference to be drawn encourages a fair hope for the future. On 15 miles of double-track blocking to be installed on the Canada division this fall the semaphore type of signal will be used and distant signals will be provided instead of over-laps. Polarized relays instead of line wire will be employed for controlling the distant signals, thus reducing the field for lightning troubles as far as possible.

Where line wire is used for indicators and for controlling slots on interlocking signals, the choke-coil arresters with iron core centers will be used, but no fuse wires will be employed either in the track or line circuits. Carbon points will be depended upon to prevent fused contacts due to light discharges, and the choke-coils will be depended upon to take care of the heavy discharges. The majority of the blocks on the Michigan Central are two miles in length, and each two-mile block is subdivided into four sections, consequently there are numerous cases where the relay of one section controls the battery of the next section. The use of carbon contacts for controlling track batteries in this way has been found satisfactory on the five miles of blocking installed last year. The average resistance of carbon contacts, established by several tests on instruments of two years' service, was 1-3 of an ohm. The average resistance of one-ampere fuse wires which were in service but a few days, based on severel tests, was 1-5 of an ohm, there-

*Paper read at the meeting of the Railway Signaling Club, Sept. 11, 1900, at Atlantic City, N. J.

Digitized by Google

fore by the substitution of the carbon contact for the fuse wire, only 2-15 of an ohm's resistance was added to the circuit, and this is far from a prohibitive resistance, even when the ballast is against the rails, as in the case on the Michigan Central, and this difference in resistance is considerably reduced as the length of service of the fuse wire is increased.

Greater effort will be made to secure good ground connections than has been made in the past. A great many failures of lightning arresters to properly perform their function may be attributed to imperfect ground connections, therefore no reasonable expense should be spared to secure good "grounds." It is proposed to dig holes deep enough to reach permanently damp earth, to imbed copper plates in crushed charcoal at the bottom of such holes and to use copper wires to make the connections between the copper plates and the arresters. It is anticipated that on this installation damp earth will be found at a reasonable depth.

It will be an easy matter to provide fuse wires if their service is found necessary in order to protect the relay and indicator coils from frequent injury, but an occasional damage to such instruments will be considered of less importance than the frequent blowing of fuse wires.

ELCTRO-CHEMISTRY IN A DYE AND PRINT WORKS.*

BY A. E. SUNDERLAND.

The action of the electric current upon dyewares and intermediate products may be brought about in several ways, of which the following are the most important: The action of the electric current upon the substance itself, at the ordinary temperature if a liquid, or if a solid, above its melting point. The action of the current upon the body dissolved in some solvent. This gives the best results.

The first methed does not give such good results as when dealing with inorganic substances, for it is too severe in its action, and usually resolves the compound into its elements. Certainly, intermediary products are formed, but these are so difficult to isolate that as a commercial method it is not to be recommended. Most members of the aliphatic and aromatic series in a molten state can be resolved into $CO_2 + H_2O$, etc., with the production of intermediate products such as oxalic acid and glycollic acid in the aliphatic series, and hydroquinone ethers and hydro-oxy carboxylic acid in the aromatic series. The simplest apparatus employed consists of two tubes joined together by a water-tight V joint, each leg containing a circular disk pole. The dimensions of the tube, the quantity of liquor, the strength of the current, and the amount consumed should all be known.

The nature of the products obtained by the electrolysis of organic bodies depends upon two things: (1) Whether the body is a good electrolyte or not, and if not, what bodies are used to make it so. (2) Whether the decomposition takes place in an acid or alkaline medium; totally different products being usually obtained by electrolysis in each medium. The primary action which takes place in an electrolytic cell is an ozidizing action at the positive pole and a reducing action at the negative pole, and the best results are gotten by adapting the process so that the products thus formed are immediately removed from the field of action. This may be done in several ways: (1) Automatically by making use of the different densities of the solutions. (2) By raising or lowering the temperature of the cell. (3) By using different electrolytes in the anode and cathode chamber. (4) By using such an electrolyte that the body formed is totally insoluble in it, and thus falls out of solution, and is unacted upon by the current.

The chief interest in the electrolysis of organic compounds centers in the behavior of the hydro-carbon radicle, which both in the aliphatic and the aromatic series seems to be very stable. The most important reactions are, however, the reduction of aromatic nitro bodies in alkaline solution, first to azo compounds and then to hydrazo compounds, these changes being produced in a very satisfactory manner, and the yield being equal nearly to the theoretical. If the same electrolyte is used in the anode and cathode chambers, the electrical osmosis is very noticeable, and is one of the chief difficulties in adapting these processes on the large scale, and results obtained tend to emphasize the law of Clausius and Hittorf, that the electric current does not overcome affinities, but that the chief reactions are produced by the primary electrolysis of the electrolyte into hydrogen and oxygen.

As regards the actual production of dye-stuffs by electricity, very few results have been published, and the known cases, such as the production of methylene blues, alizarin black, etc., simply depend upon the oxidizing action of the electric current in the anode cell, Goppelsroeder, in 1886, published several results which he had obtained on a laboratory scale by the oxidation of various primary amines. He states that by the action of the electric current on aniline hydro-chloride in acid solution, emeraldine and aniline black are produced, and by the electrolysis of aniline salt alone a brown precipitate and red to violet coloration only is obtained. Further results which Goppelsroeder recorded are as follows: With methyl aniline he obtained a blue coloration; with diphenylamine, a violet coloration; with salts of napthylamine, brown bodies; with napthol, a golden yellow; while magenta, methyl alcohol, and potassium fluoride gave Hoffmann's violet. Goppelsroeder also produced aniline from nitrobenzine, and alizarin from anthraquinone.

Electricity may be applied in the dyeing process itself in two ways: (1) in printing. (2) in the dye bath. With regard to electric printing Goppelsroeder proceeded as follows: A plate of lead or other suitable conducting material is used as the negative pole, and the stencil pencil or plate is used as the positive pole. Between these is fed the cloth impregnated with the various chemicals. On passing the current, decomposition of the various chemicals take place wherever the stencil plate touches, and the design is produced. As instances: (1) If the cloth be impregnated with an acid solution of aniline salt an aniline black figure is produced. (2) If the cloth be impregnated with potassium thiocyanate a yellow to orange figure is produced. Goppelsroeder also found that some dyes, such as turkey red and indigo blue, could in the same way be discharged white by the electric current, and thus by combination with the analine black and canarin yellow, he could produce white, black, and yellow prints on red or blue ground. If metallic oxides were used, the oxide was precipitated, and the cloth on dyeing with alizarins, would show a design where the current had passed.

These results, as obtained by Goppelsroeder, are very interesting, and with the azo dyes some equally interesting results have since been obtained. The diazo compounds are so unstable that they are decomposed by ordinary daylight. I have subjected such to the ordinary current, and find that with a current of 20 volts to 40 volts 5 amperes a five seconds' contact will in some cases cause the decomposition, and on developing, the print will remain undeveloped. This discharge, however, is not quick or good enough, but it can be intensified by mixing along with the diazo compound a certain amount of sodium chloride, nitrate, chlorate, or other suitable chemical, which will, on the passage of the current, liberate compounds capable of discharging the diazo compound more thoroughly. Such reactions may be greatly extended, and by making use of the colors themselves instead of bases which contain the amido group, some very useful effects can be obtained, such as, for instance, with rosaniline, red and dark brown patterns can be obtained; with safranine, red and dark blue, and with cyanole some very peculiar combinations can be obtained. Cyanole on diazotizing becomes yellow, but wherever exposed to air or some oxidizing agent, such as an electric current, is turns a fine peacock blue shade, and on washing the print with a phenol or soda the effect is permanent. This, along with the use of bases such as thiotoluidines, gives some useful results. Another branch of printing by electricity, which also offers some very interesting information, is the combination of organic cases along with the use of metallic anodes. This may be made use of for the production of effects of the opposite kind to the above, and most certainly in cotton and paper printing it is worth experimenting with.

There are only two machines I have seen recommended for electrical dyeing, and these in no way offer any advantage over ordinary processes. From my own experiments, I consider that a machine for this purpose should fulfill the following requirements: (1) The poles must not be of metal, but of carbon or biscuit porcelain, which conduct by becoming saturated with the electrolyte. (2) They must be as near to one another as possible. (3) The cloth must pass between the poles in the open width. (4) The poles may be perfectly smooth, and preferably cylindrical, revolving freely. These particulars are necessary, because in the ordinary passage of the electric current across any dye solution, the tendency of the dye is to concentrate itself around the negative pole, and not to circulate freely in the whole dye vessel, thus there is always a great danger of unevenness.

In the finishing of goods the peculiar effect which is produced by calendering a piece in two different directions, one impression upon another, is well known. This is technically termed water-marking or moire, and is due to the irregular reflection from the surface of the material, one part of the light being totally reflected, and the other part dispersed. This effect can be introduced in several ways. One way is by displacing the warp or weft threads in an irregular manner by means of combs. Another method is by placing the chief reflecting surface below an upper gauze surface, which being free to move causes a constant change of reflections, and produces this effect in a very pretty manner. But still another method is by electricity. The new process resolves itself practically into the local application of electrolysis. A platinum plate of suitable size is

* Paper read before the Society of Dyers and Colorists at Bradford (Eng.) Technical College.

Digitized by Google

connected with the positive pole of the source of current. On this conducting surface is placed some absorbent material saturated with a solution of common salt. On this pad is placed the fabric to be water marked, and the plate engraved with the water mark connected with the negative terminal is pressed down upon it. The salt solution is decomposed, and a facsimile of the water mark is printed on the cloth. To produce opaque designs, the absorbent material is saturated with a solution of barium chloride, which is decomposed on passing the current.

The electrical pressing machine introduced by Schreihage may also be mentioned. By its employment it is possible to hot-press any description of fabric for any duration of time, at any required temperature, and all this in an apparatus which is perfectly clean and dry, and in an atmosphere free from superfluous waste heat and steam. An ordinary press is used, and may be operated hydraulically or by any other method The press is identical with those in ordinary use. Press boards are provided, composed of suitable insulating material, inside which are embedded the heating wires. The ends of these wires terminate in a double plugway in front of each plate. The switchboard is mounted on wheels for convenience. It can thus be utilized for any press, or can be wheeled into a corner out of the way when not required. The fabric is placed in the press in the ordinary manner, and the current switched on. The plates become warm almost immediately, and when the current is switched off are soon cool enough to handle. The cost of the process is, I understand, not more than the present method of pressing when everything is taken into consideration.

THE ASSOCIATION OF EDISON ILLUMINATING COMPANIES, ITS FIELD AND WORK—PAST, PRESENT AND FUTURE.

[At the recent convention of the Association of Edison Illuminating Companies, held at Saratoga, N. Y., Mr. J. W. Lieb, Jr., in his presidential address reviewed the history of the organization. The following is an abstract of his remarks.]

The object of this Association, as defined in the constitution and by-laws, is: "The mutual protection of business interests, and the collection and dissemination among its members of technical and business information relative to the Edison electric light system and auxiliary systems operated in connection therewith" You will thus see, at the start, from this statement of the objects of the Association, that there is a striking difference between our organization and kindred organizations—such as the American Institute of Electrical Engineers, the National Electric Light Association and many of the State organizations. Instead of being a purely technical body, like the American Institute of Electrical Engineers, this Association while, in one sense of the word, technical, has, in addition, important commercial interests to safeguard. One of the conditions of membership requires that its members be licensees under the Edison patents; that is, licensees of the Edison Electric Light Company, the Edison General Electric Company or the General Electric Company.

There is one striking peculiarity in our organization and that is that companies and not individuals constitute the membership of the Association. The officers are merely representatives of the companies constituting the Association. This fact, which is peculiar to our organization, has advantages and possibly some disadvantages. It is, of course, to be expected that in a body of this character, in which manifold interests are represented, and which has such a wide field of activity, the larger companies take a predominant interest. This must be the case from the connection of many of its representatives with the original Edison interests; it must also be so from the fact that the larger companies have large executive and operating staffs, and therefore are more largely represented in the conventions and as authors of the papers that are brought before it. I think you will agree with me, however, that in the work of the Association, due weight has been given to the value of the membership of the smaller companies, and that every effort has been made to stimulate their interest and attendance, and I am happy to say that in this respect we have been markedly successful. The smaller companies by their attendance and active interest in the work of the Association have, in turn, stimulated the larger companies in its behalf.

In the early days of the electric lighting industry the standardizing committee of the Edison interests did valuable work in the standardizing of Edison chemical meters and many Edison appliances, one of your former presidents, Dr. A. E. Kennelly, rendering valuable service in this field. Much of this early work has been of value, not only to the Edison interests, but has become part of the history of the art. Many of Dr. Kennelly's investigations and experiments conducted in connection with this standardizing work have become the accepted reference data in electrical engineering work. I need only refer to his tests on the carrying capacity of wires under different conditions, cross section, insulation and environment. This Association, through its member companies and their technical staffs, has done valuable work for the industry generally; through their close relations they have been able to find useful applications for newly developed apparatus, and once found, these types have had prompt and general adoption to the material benefit of themselves, and the general advantage of the electrical industry. I refer in this connection to the stimulus given to the application of storage batteries to central station service, by the pioneer work of some of the larger companies, by the interchange of experience in their use, inducing others to determine each for itself the advantages which it might derive from their use. There can be no doubt that the work of the companies constituting your membership and the reports of your committees have materially contributed toward the development and improvement of what is now considered an invaluable adjunct to central station and distributing equipment. I will also refer, briefly, in passing, to the influence which the members of the Association have in stimulating the manufacturers to produce new apparatus to meet new requirements as they arose; and to the influence of the individual companies in stimulating the development of such apparatus as the first examples of direct connected units, arc lamps on low tension circuits, rectifiers, phase and frequency changes, composite generators, etc. The members of this Association have exerted a constant pressure upon the manufacturing companies in bringing them to realize that they must develop apparatus to satisfy the new conditions and requirements as the extension of their business developed new wants. It is unquestionably true that the manufacturing companies have in turn profited by the development of this apparatus, being able to find at once purchasers and an outlet for their product among our companies, whose close connections enabled them to promptly appreciate the value of newly developed apparatus.

During the existence of the Association, the member companies have gradually broadened their business field. Originally confined to companies that were Edison licensees, exploiting exclusively the Edison system, most of the companies now find themselves in new relations with their former powerful and conservative competitors, the gas interests; new relations in connection with the development of transmission lines in conjunction with their distributing systems; new relations in connection with alternating current generation and distribution, and new relations in connection with the joint operation or absorption of series arc systems. These new relations must necessarily bring us into contact with new problems with points of view broader than simply the Edisonian, and it is hardly necessary to say that contact with these new interests and the assumption of these new relations must be of great benefit to us. Take, for instance, the gas interests. For years, they have been developing their business and organization, and their knowledge of the public and its requirements must be vastly superior to the knowledge possessed by those engaged in our more recently developed electrical industries. Their methods and policy have been developed on conservative lines, their usually strong financial position attesting executive ability of the highest order, and we certainly must profit by closer relations, with this older well-established industry. They, in turn, must profit by feeling the youthful pulse of the new industry which, in spite of opposition and keenest competition, in spite of large vested interests arrayed against it, has been able to assert itself and claim a permanent position as one of the safest as well as most remunerative fields of investment. It seems to me, therefore, that these new relations, which are daily increasing, must be mutually profitable. It is also true that the new relations with transmission systems, the various forms of distributing systems, joint operation in combination with railway systems, will enable electric companies to broaden their field of operation, and these features will all be helpful to it in enabling the supply company to generate its product at reduced cost. I know of no body of men which could so successfully handle these new demands, assimilate, co-operate with or become an adjunct to new interests and broaden the field of industrial enterprise as the men constituting the administrative and technical staffs of the companies that are members of this Association. The readiness with which the Edison companies have assimilated new systems, the fertility of resources they exhibited in combining with other systems, retaining what was best, discarding the less satisfactory features, often modifying or even entirely changing the strictly Edisonian point of view, where contact with other systems and other apparatus showed this to be of advantage in meeting the new situation, these qualities of the organization, system, and equipment which the Edison companies displayed, is sufficient refutation of the statement one hears now and then, that the Edison companies are narrow-

Digitized by Google

viewed, ultra-conservative and non-progressive, adhering to antiquated traditions and slow to rise to the new responsibilities.

We claim that this Association can with pride assert itself to have been the pioneer in developing broad lines, and the uniform success of the Edison companies which are members of this Association, amply demonstrate the excellence of the lighting and power system with which we began our development, and the faithful energy with which the business has been pushed.

I would refer to the fact that the Association has enjoyed the sympathy and good will of the press, notwithstanding the fact that we have supplied it with only brief reports of our conventions or business proceedings, many of the papers presented and the discussion thereon being in great measure of a confidential character. The good work we are doing, and its advantage to the industry at large, have however secured us the sympathy of the press, a substantial aid in the prosecution of any undertaking, in the benefits of which the public has a share.

While the few remarks I have made are hardly such an address as you may have expected, or as I should have desired to present, I hope they will be helpful to you in obtaining a just and adequate idea of the work which the Association is doing and what it may be called upon to undertake, and they may stimulate the mutual co-operation of our members and the interchange of information to our mutual benefit.

THE SEARCHLIGHTS AND LIGHTHOUSE OF THE EIFFEL-TOWER AT THE PARIS EXPOSITION.

(Translated for ELECTRICITY, from "La Vie Scientifique, Paris, France.)

At nightfall every day, thousands of electric lamps besides the gas and incandescent burners and the acetylene light convert the Paris Exposition grounds into a regular luminous palace which looks from a far distance like an immense fire. The Eiffel Tower only, which is just as attractive as formerly, detaches its astonishing silhouette from the sky and its lantern projects the national colors in all directions, while three powerful searchlights overflow the city of Paris with their luminous effects, thus increasing the general illumination.

The most powerful of these searchlights (Fig. 1) is located on the northeast side of the tower and can send its rays in an angle, the extreme limits of which are the Arc de l'Etoile (star arch) and the Esplanade des Invalides. This searchlight is of the Mangin spherical reflector system, same as the other two. It is fed by a current of 2000 amperes and illuminates the objects with an intensity equal to that of the sunlight within a radius of 10 kilometers. The electrical power station for these searchlights is located at the south end of the tower.

The reflectors of the other two searchlights (Fig. 2) have only 90 centimeters of diameter; one of them is in a fixed position on top of the allegorical group which crowns the front of the Chateau d'Eau, while the other one, mounted upon rails, is movable and changes its position by the hand movements of an operator, its angle of projection being limited by the Trocadero, extending as far as Auteuil. Both searchlights are placed on the roof of the platform of the third story, about 12 meters below the lantern. They are operated by a current of 110 amperes and constructed by Messrs. Sautter Harlé & Co., who have also constructed the third most powerful one.

The luminous focus in these apparatus is located near the reflector and the carbons, which have a diameter of 4 centimeters, are inclined at an angle of 45 degrees. The lantern which

FIG. 1.—THE LARGE SEARCHLIGHT ON THE EIFFEL TOWER.

crowns the building is exactly 300 meters above the ground. It is formed by an electric automatic lamp, the carbons of which have a diameter of 3 centimeters and are encircled by lenses arranged in echelons. Above them are dioptrical glasses for the purpose of carrying the light very far while the total reflection is produced by an arrangement of catadioptrical glasses below. The electric arch gives 5,500 carcels, but owing to the arrangement of the

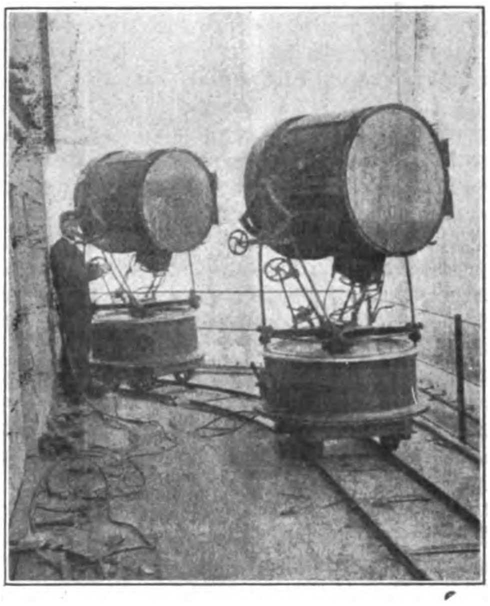

FIG. 2.—THE MOVABLE SEARCHLIGHTS OF THE EIFFEL TOWER.

different systems of glasses which encircle it, this luminous capacity is increased to about 100,000 carcels within a radius of 2,500 meters.

Contrary to the general belief it must be stated that the optical arrangement is fixed, and the turning movement as it appears to the eye is obtained by means of an exterior movable drum carrying vertical stripes of blue, white and red glass which are separated by dark panels. This drum is driven by a small electric motor and performs a revolution in 90 seconds.

The current necessary for feeding the searchlights and the lantern is furnished by the power station located in the southern pillar of the tower and special conduits connect each of the above apparatus to the electro-generating machinery.

There are other lanterns and searchlights on the roofs of private buildings which cross their light effects with those originating on the Eiffel Tower, contributing thus to increase the general illumination of the Exposition grounds.

Among the most important we mention the Katsépé lantern, the searchlight of the Optical Palace, the small searchlight of the Lefevre-Utile Building, and the great projector on top of the German Palace of Navigation and Commerce, which is controlled directly by the German Department of the Army and Navy Palace.

THE UTICA MINES' ELECTRICAL POWER PLANT.*

Eight miles northeast of Angels Camp and about one and one-half miles east of Murphys in Calaveras County, Cal., the Angels Electric Light & Power Company is operating a power plant which furnishes power for the famous Utica mine, which for years had an annual production of between five and six millions in gold, and has thus attained the reputation of having the largest output of any California gold mine. The stock of the Angels Electric Light & Power Company and of the Utica Gold Mining Company and the Hobart Estate Company is all held by practically the same individuals, though each corporation maintains a distinct organization. Students of the use of electrical power in mining operations have recently been giving considerable attention to the power plant in question, and C. E. Heise, the engineer who supervised the installation, has frequently been called upon to describe the interesting plant. J. Frank Gurney recently wrote a valuable description of the plant for the "Journal of Electricity, Power and Gas," to which we are indebted for the information contained herewith.

Water for the operation of the plant, writes Mr. Gurney, is obtained from the ditch of the Union Water Company, also owned by the Utica and Hobart Estate companies, and its reservoirs are situated in Silver Valley, Alpine County, where a reserve capacity of 1,000 miners inches for seventy days is available. During the greater part of the year the water is taken out of the north fork of the Stanislaus River, the reservoirs being drawn from only when the flow of the river decreases to an amount less than that necessary for the operation of the plant. A flume five and three-quarter miles long takes the water from the river and delivers it to a ditch that is twenty miles in length. This ditch terminates in the penstock, which is noteworthy in that it is divided into two compartments that are so connected by gates that either compartment may be drained and cleaned without shutting the plant down. Each of these compartments is connected to the main pipe line through its respective upper leg of the "Y" that is placed

* From the "Mining and Metallurgical Journal."

at the upper end of the pipe line. The pipe line is 1,550 feet in length, with diameters ranging from thiry-six inches at the top to twenty-eight inches at the bottom. The true head is 536 feet, and the effective pressure at the wheels is 225 pounds per square inch.

The power house is a substantial structure of lava built on bedrock, and all foundations are of dyke laid on bedrock in strong cement. The building at present measures fifty by thirty-seven feet with one end unfinished to allow of an addition to accommodate more generators. As it stands at present, the plant is arranged to house only the two complete units that are now installed.

These units each consist of a 750-kilowatt, 500-volt, two-phase, 7,200-alternation revolving armature type alternator, running at 400 revolutions a minute from a 1,200 horse-power water wheel by direct connection; two 375-kilowatt, oil insulated transformers stepping up from 500 volts two-phase to 16,500 volts three-phase; a separately-driven exciter, together with the usual forms of switchboard panels, high-tension switches and fuses and the Wurts non-arcing lightning arrester system. When completed, the power house will contain three such units. In addition to the transformer equipment given above, one special transformer has been installed for use in emergencies. This special or spare transformer is so arranged that it can be substituted for any other step-up transformer, should it become necessary.

If it be necessary to cut out transformer B, the three main switches through which its secondaries are thrown on to the main high-tension bus bars are opened and the five switches connnecting the secondaries of the special transformer to the same bus bars are closed, and power is delivered to the line as before. The spare transformer may be run in parallel with either transformer A or B, and ordinarily the load may be transferred from any transformer to the spare transformer without interruption to the service. The spare transformer is of the same capacity as the standard ones and its distinguishing feature rests in the fact that its secondary carries four taps from which are taken two 100 per cent. one fifty per cent. and one 86.7 per cent. leads. The wiring and switches for the same appear supported on timbers imbedded in the wall back of and above the bank of transformers.

The line consists of No. 1 B. & S. gauge hard-drawn copper, and the wires are strung on one side of the pole to allow a second line being built at some future time. Triple-petticoat glass insulators, guaranteed to stand 25,000 volts are used, and the pins are of eucalyptus boiled in paraffin. All cross-arms are painted with P. & B. paint. The poles are set forty to the mile, and are thirty feet, forty feet, and, at road crossings, fifty feet in height.

The sub-station at Angels Camp contains lightning arresters, high-tension switches and fuses controlling all the high-tension feeder circuits for the mines operated therefrom; also high-tension switches and fuses for the sub-station transformers, which at present consist of two three-phase to two-phase, seventy-five kilowatt, air-cooled, oil-insulated 15,000 to 400 volt transformers, supplying current to a 150 hp. type "C" induction motor driving the Stickle mill; two three-phase to two-phase 150 kilowatt lowering transformers of the same class as the above, but reducing from 15,000 to 2,000 volts for supplying current for the operation of a 150 horse-power, type "C" motor at the Utica mill and also furnishing 150 kilowatts for the operation of the alternating current arc and incandescent lighting of the town of Angels Camp. These local lighting circuits are controlled by a separate switchboard located in the sub-station. Four other seventy-five kilowatt transformers, accompanied by four booster transformers, are also installed and are delivering power to the Calaveras lines of the Standard Electric Company of California for the lighting of San Andreas, Mokelumne Hill, Jackson, Sutter Creek, Amador City and smaller towns.

From the sub station at Angels Camp another three-phase line is run to the Lightner mine where a 100 horse-power, type "C" induction motor drives a forty-stamp mill, and a 150 horse-power induction motor of the same type and make drives an air compressor from which is operated all hoists and drills used in the Lightner mine. A second high-tension line runs from the sub-station to the Gold Cliff mill of the Utica company and supplies power through lowering transformers to a 75 horse-power, 400 volt, type "C" induction motor that is used for running the forty stamps and concentrators in the mill. All these installations are highly successful in every way.

It was in 1893 that the progressive owners of the Utica properties found that the high price of fuel compelled them to investigate the possibilities of electrically transmitted power for their mine. Two years later they put up a small plant, which gave them excellent lighting facilities and also enabled them to study the applications of electricity to their properties. The original plan was a modest little house, which, however, answered its purpose so well that the managers were induced to put up a much larger building well equipped with the best modern electrical machinery, which we have described.

The Electrical Treatment of Tuberculosis.

The medical faculty of Paris, says the Washington "Times," is devoting considerable attention to a new cure of tuberculosis through the transfusion of microbe-destroying drugs by means of electrical currents passed through the patient's chest and lungs. The discovery of the treatment, which has been submitted to severe tests at Paris and Bordeaux during the last four years, is attributed to M. Francisque Crotte, of Paris, and exhaustive reports on the results of these experiments were read before the International Medical Congress recently by Dr. Bertheau, medical delegate to the congress from the city of Paris, and by Dr. Ducamp, delegate to the congress from Bordeaux. A third paper on the same subject was submitted to the congress by Dr. Labadie, who attended the congress as a delegate of the Medico-Legal Society of New York.

The conclusions of the three reports are emphatically in favor of the new treatment, and this view is shared by Prof. Virchow, of Berlin, and by Dr. Brouardel, of Paris, who predict that the treatment is likely to receive the sanction of the medical faculties of Paris and Berlin for adoption in the public hospitals of those cities.

The Paris physicians consider that M. Crotte's discovery may have far-reaching consequences, for it enables extremely powerful antiseptics to be introduced into the human system and permeate the tissues and even the bones, so that the bacilli may be killed without injury to the patient, which would result if the same drugs were absorbed by the system through the stomach or by other means hitherto employed. Long series of experiments have convinced the physicians here that a solution of formol, known as formaldehyde, containing iode and mercury, is absolutely fatal to the bacilli of tuberculosis, even when applied in the form of vapor. This exceedingly powerful antiseptic cannot without great danger be taken through the stomach, and the reports submitted to the Medical Congress by Drs. Bertheau, Ducamp and Labadie show that by static electricity the vapor of formaldehyde has been transfused into the tissues of the chest and lungs, thereby destroying the bacilli of tuberculosis and preventing reproduction in their tubes of cultivation.

Since M. Crotte communicated the theory of his discovery to the French Academy of Science in 1894, 800 tuberculosis patients in France have been treated by his method and 600 of these have been completely cured. The number of patients whose treatment has been set forth in "clinical" detail by the reporting physicians and submitted to the congress is 42. Of these, 10 were reported upon by Dr. Bertheau, 11 by Dr. Ducamp, and 21 by Dr. Labadie. All the cases known to have been treated by the new method are divided into three categories: first, patients who are in the first stage of tuberculosis; second, those who have reached the second stage, and third, those where the progress of the disease is so advanced that under ordinary circumstances they would be considered incurable.

LONDON NOTES.

[From our London Correspondent.]

The New Generating Station of the City and South London Railway.

Now that the great excitement created by the inauguration of the Central London Railway has to some extent subsided, engineers are turning their attention again to the City & South London Railway, which has equipped a new generating station at Clapham on very different lines from those adopted for the original station opened in 1890, and from the system employed by the Central London Railway at Shepherd's Bush. The great point of difference, appealing to engineers in this country, is found in the fact that the power station of the Central London Railway is American from top to bottom, while that of the City & South London is developed and equipped on exclusively British principles, with British made machinery. The old generating station, which did ten years' good service, although its machinery naturally was not quite so economical as was desired, is now to be used for tool and repair shops. All of the original machinery has been disposed of with the exception of one 125 kw. Siemens-Willans set, which is now doing service in the new station, together with two 300 kw. high-speed Siemens-Willans sets, and two 800 kw. steam generators with Corliss compound engines with very heavy fly wheels, driving Electric Construction Company's generators, which are compound wound to maintain a constant potential of 500 volts at the switchboard. Surface condensing plant and Klein's cooling towers are installed. The system of distribution is of great interest. The three-wire system was adopted by the officials after careful consideration of the objections which had been stated against it for service of

Digitized by Google

this kind. On the original line the ordinary two-wire system was employed, but when the extensions were taken in hand it was considered no longer suitable on account of the return drop in the rail and the loss in the feeders. The three-wire system with balancers was adopted, and the officials assert that the first few months' working has been quite satisfactory. The running rails form the middle wire, and the working conductors in the tunnels the outers, with a difference of 1,000 volts between, namely, 500 volts between the working conductor and the running rail in each tunnel. The working conductor in each tunnel is fed to three points, namely, Stockwell, Kennington and London Bridge. The Kennington feeder is coupled through a booster to compensate for the drop in the feeder. At London Bridge the battery sub-station and reducers maintain a constant potential. From the main board at Stockwell the London Bridge substation is fed on a five-wire system, a motor generator being placed between the bus bar and the high tension feeder, adding 500 volts to the feeder. At the London Bridge substation there is a battery of 556 Tudor accumulators. At the stations at Moorgate street, the Elephant and Castle, and Clapham Common balancers are placed, each of which is capable of dealing with a load of 160 to 200 amperes, concentrated on one side of the system.

The boilers are nine in number, of the Davey-Paxman "Economic" type, 15' 6" x 8' 9". Vicars' mechanical stokers are fitted to each.

Mr. P. V. McMahon, the chief engineer to the company, designed the power station and its equipment, and the work was of course carried out under his supervision.

LEGAL NOTES.

Judge Pollock recently handed down a decision in the case of the Fargo (N. D.) Gas and Electric Company against the Fargo Edison Company, favorable to the latter. The former company claimed an exclusive and perpetual franchise, granted in 1881, and sought to prevent the Fargo Edison Company from erecting poles and stringing wires. A temporary injunction had been issued to that effect till the case could be heard on its merits. Judge Pollock holds that the original company has no exclusive franchise and also dissolved the injunction against the Fargo-Edison people. The case will be appealed to the Supreme Court. Much of the trouble started over the poles. The telephone company has one side of the street and the light companies are fighting for the other. The old company claims damages by induction from the wires erected by the Fargo-Edison Company.

Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended September 13:

Aberdeen, 3 cases, $400; Antwerp, 23 cases, $4,034; 1 case motor trucks, $25; Australia, 257 cases, $15,770; 270 trolley poles, $9,700; 600 cable reels, $32,800; Brazil, 7 cases, $1,324; Bristol, 86 packages, $10,135; 26 packages electric cables, $4,433; British East Indies, 25 packages, $1,334; British Guiana, 26 packages, $786; British Possessions in Africa, 44 packages, $2,966; British West Indies, 7 packages, $131; Cantillana, 63 cases, $12,504; Central America, 69 cases, $1,057; Chili, 1 case, $24; Copenhagen, 6 cases electric cranes, $1,400; Cuba, 42 packages, $1,834, 8 cases, $173; Dutch East Indies, 6 cases, $261; Dutch West Indies, 2 packages, $38; Ecuador, 1 case, $15; Glasgow, 54 packages, electric cable and fixtures, $14,085; 5 cases, $89; Hamburg, 1 motor car, $915; Havre, 109 cases, $5,162; 8 cases insulators, $312; Hull, 1 case motors, $180; Japan, 111 cases, $18,971; 7 cases motors and parts, $1,006; Jarrow, 52 packages, $10,600; Leghorn, 1 case, $15; Liverpool, 54 cases, $3,411; 75 cases trolley poles, $2,200; London, 136 cases, $14,047; 14 cases motors, $803; Madrid, 25 cases, $3,900; Manchester, 1 case, $300; Marseilles, 9 cases, $762; Mexico, 101 cases, $1,479; Newcastle, 32 packages, $1,650; New Zealand, 5 cases, $82; Peru, 58 packages, $990; Philippines, 42 cases, $6,125; Porto Rico, 20 packages, $455; Riga, 25 cases, $429; Siam, 23 packages, $395; Southampton, 1 case, $190; 11 packages, $556; St. Petersburg, 1 case motors, $145; Tynemouth, 2 cases, $200; U. S. Colombia, 8 packages, $605; Venezuela, 71 packages, $126.

PERSONAL MENTION.

Mr. John I. Beggs was lately chosen president of the Appleton (Wis.) Electric Company.

Mr. Roland T. Carlisle, formerly of Buffalo, N. Y., but for the past two years connected with the Western Electric Company of New York, died in this city last week of typhoid fever.

Mr. Frank S. Bloodgood, for many years the manager of the Owego (N. Y.) telephone exchange, but for the past year relieved from duty, will be reinstated as manager in about a week.

INCORPORATIONS.

The Sherburne Electric Light & Power Company, Sherburne, Minn. Capital stock, $15,000.

The Acme Electrical Company, Philadelphia, Pa.—to deal in electrical supplies. Capital stock, $100,000.

The Sunbeam Incandescent Lamp Company, Glenridge, N. J. Capital stock, $150,000; capital in Illinois, $38,000.

The Electropulsion Company, Newark, N. J.—to apply motors to vehicles. Capital stock, $100,000. Incorporators: A. G. Voght, F. K. Irving, L. S. Mott and others.

The General Light & Power Company, Charleston, S. C.—to do a general electric light and railroad business. Capital stock, $5,000,000. Incorporators: M. J. Hogan, T. J. Begley, T. F. Daley, L. H. Cohen and A. Preston, all of Philadelphia, Pa.

The Grand Rapids Company, Grand Rapids, Mich.—to do a general railroad and telegraph business. Capital stock, $5,000,000. Incorporators: J. P. Rinn, J. F. Hill, T. F. Shanlan, F. L. Drew and A. Smith, all of Boston, Mass.

The Westville Electric Light & Power Company, Danville, Ill.—to operate an electric light, power and steam plant. Capital stock, $20,000. Incorporators: M. Kelly, W. M. Kelly and E. J. Kelly.

The Howard Electric Company, Kansas City, Mo. Capital stock, $20,000. Incorporators: James H. Howard, W. S. Voigt, W. P. Robinson, Jr., W. L. Poffenbarger and Edward L. Massie, all of Kansas City.

The Troy Electric Leasing Company, Troy, O. Capital stock, $25,000. Incorporators: C. C. Hobart, Walter H. Colis, Herbert L. Johnson, Adeline S. Johnston and Ida Rhodes.

The Light Weight Battery Company, Newark, N. J.—to deal in electric batteries, etc. Capital stock, $500,000. Incorporators: A. G. Voght, F. K. Irving, P. T. Austen, H. Tuttle and L. S. Mott.

The Alden Electric Company, Chicago, Ill.—to do a general manufacturing and mercantile business. Capital stock, $12,000. Incorporators: Fred H. Alden, J. Schlesinger and Jacob Geiserowich.

COMING ELECTRICAL EVENTS.

American Electro Therapeutic Association—Will meet in New York City Sept. 25-27, 1900.

American Street Railway Association—Will meet in Kansas City, Mo., Oct. 16-19, 1900.

National Association of Municipal Electricians—Will meet in Pittsburg, Pa., Sept. 25-27, 1900.

Roentgen Society of the United States—Will meet in New York City Dec. 13-14, 1900.

ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U. S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N.W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

LETTERS PATENT ISSUED SEPTEMBER 11, 1900.

ELECTRIC RAILWAYS AND APPLIANCES.

657,628. Ice Removing Trolley for Electric Railways. John J. Shirkey, Chicago, Ill. Filed April 30, 1900.

657,637. Trolley-Head, Stanislas Bourgeois, Manchester, N. H. Filed April 10, 1900.

657,730. Electric-Railway Signal. George H. Dunham, Quincy, Mass., assignor of one-half to Elmer H. Heath, Boston, Mass. Filed Nov. 11, 1899.

657,757. Electric Bond for Railway-Rails. Harold P. Brown, Montclair, N. J. Filed Feb. 18, 1899.

657,830. Conductor and Collector for Electric Railways. Arthur Petzenburger, Berlin, Germany. Filed Dec. 8, 1899.

657,887. Electric Train-Signal Device. James F. Scullen, Chicago, Ill. Filed Jan. 26, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

657,541. Device for Fixing Incandescent Electric Lamps. Louis J. P. Hollub and Henri Mignal, Paris, France. Filed May 29, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

657,703. Electrical Rheostat. Harry W. Leonard, New York City. Filed Feb. 11, 1899.

657,760. Electric Igniter for Explosive-Engines. Isaac H. Davis, Boston, Mass., assignor of one-half to E. D. Mellen, Cambridge, Mass. Filed Nov. 18, 1899.

657,795. Electric-Circuit Closer for Looms. Harry W. Smith and William H. Redding, Worcester, Mass. Filed July 13, 1898.

TELEPHONES AND TELEPHONE APPARATUS.

657,854. Combined Telephone Signal and Jack. Oren R. Cline, El Dorado, Kan. Filed Feb. 6, 1900.

MISCELLANEOUS.

657,516. Motor-Vehicle. Clyde J. Coleman, Chicago, Ill., assignor, by mesne assignments, to the General Automobile Company of New Jersey. Filed Oct. 27, 1899.

657,527. Process of Making Metallic Duplicate Phonograph-Records. Thomas A. Edison, Llewellyn Park, N. J. Filed May 4, 1900.

657,574. High-Voltage Insulator. Alf Sinding-Larsen, Frederiksvaern, Norway. Filed Dec. 11, 1899.

657,638. Secondary-Battery Plate. William Bowker, Sr., Waltham, Mass. Filed Jan 19, 1900.

657,646. Apparatus for Reclaiming Tin and Zinc from Tinned and Zinc Scrap. George B. Cruickshank, Birmingham, Herbert R. S. Coleman, Smethwick, and Percival Cruickshank, Birmingham, England. Filed May 28, 1900.

657,650. Automobile Vehicle. Leonard H. Dyer, Washington, D. C., assignor of one-fourth to Frank L. Dyer, Montclair, N. J. Filed June 8, 1898.

657,659. Secondary Battery. Augustus Jamieson, Elizabeth, N. J., assignor of three-fifths to Sydney H. Carney, Henry E. Knox and William Watt, New York City. Filed Nov. 18, 1897.

657,678. Secondary Electric Clock. George P. Rose, Jr., Dubuque, Iowa, assignor to Barnim L. Behrendt, New York City. Filed Oct. 30, 1899.

657,694. Electric Clock. George Fichter, Lynn, Mass. Filed Jan. 10, 1900.

657,711. Motor-Vehicle. Francis E. Stanley and Freelan O. Stanley, Newton, Mass., assignors to the Stanley Automobile Company of New York. Filed Oct. 16, 1899.

657,722. Means for Controlling Excitation of Boosters or Generator Fields. Joseph Appleton, Philadelphia, Pa., assignor to the Electric Storage Battery Company, Gloucester City, N. J. Filed March 30, 1899.

657,731. Graphophone-Clock. John F. Eldred, Chicago, Ill. Filed Oct. 28, 1899.

657,732. Coupling for Electric Conduits. Edward S. Francis, Hartford, Conn. Filed July 6, 1900.

657,736. Electric Furnace. William S. Horry, Sault Ste. Marie, Mich., assignor to the Union Carbide Company, Chicago, Ill. Filed Nov. 23, 1897.

657,771. Transmission Device for Motor-Cars. Fritz Henriod Schweizer, Marin, Switzerland. Filed April 12, 1900.

657,782. Electric Elevator. John W. Mabbs, Chicago, Ill. Filed July 26, 1897.

657,785. Phonograph. Ademor N. Petit, Newark, N. J. Filed Oct. 27, 1899.

657,804. Tip for Commutator-Segments. Anton R. Westerdahl, New York City, assignor to the General Electric Company of New York. Filed May 31, 1900.

657,828. System of Multiple-Rate Metering. Eustace Oxley, Lynn, Mass., assignor to the General Electric Company of New York. Filed July 31, 1899.

657,829. Multirate-Meter. Eustace Oxley, Lynn, Mass., assignor to the General Electric Company of New York. Filed Aug. 7, 1899.

657,853. Electric Lock. Henry G. Carleton, New York City, assignor to the Carleton Electric Company, same place. Filed Jan. 13, 1900.

657,855. Frictional Driving Gear. Clyde J. Coleman, Chicago, Ill., assignor to Thomas J. Ryan, New York City. Filed Jan. 12, 1900.

657,861. Electric Measuring and Indicating Apparatus. Horace Darwin, Ernest H. Griffiths and William C. D. Whetham, Cambridge, England. Filed May 29, 1900.

657,892. Electrically-Actuated Safety-Device for Elevators. Nelson B. Keyser, Philadelphia, Pa., assignor to Marcus B. May, Winchester, Mass. Original application filed Oct. 17, 1893. Divided and this application filed Oct. 29, 1897.

657,899. Motor-Vehicle. Clyde J. Coleman, Chicago, Ill., assignor to Thomas J. Ryan, New York City. Filed Dec. 8, 1899.

THE TELEPHONE WORLD.

Independent Telephone Companies in the South.

The combined interests of the independent telephone companies of the States of North and South Carolina are making a fight against the Bell Telephone Company in the above territory in the line of business competition. The independent interests are strongly organized as the "Independent Telephone Association of the Carolinas," with W. B. Moore, of Yorkville, S. C., as president.

The independent lines have been in existence for about four years and represent in round numbers about $1,000,000. In many toyns the franchises of the independent companies hold them to stipulated rates, which, they claim, are lower than the Bell rates wherever the two companies have come into competition, and it is further claimed that as a result the Bell Company has been compelled to lower rates, in some instances 50 per cent., in order to compete with the independent lines.

One hundred cotton mills in the Piedmont section of the Carolinas are connected together by the independent lines, and it is claimed that these lines are an important factor in the development of this as yet only partially developed territory. The independent lines have grown in numbers, from a small beginning to 125 separate lines, with a total of 12,000 'phones.

It is claimed by the independent men that they have a more comprehensive service than their competitors in that territory. In addition a movement is now on foot to organize the separate independent lines into a company, having headquarters at Spartanburg, Columbia, Charlotte and Greenville, and the object is to obtain a service which shall give the telephone subscribers a service embracing the entire independent system.

The Rome (N. Y.) Home Telephone Company's plant is in operation—not only in operation but successfully so. With the improved switchboard, long distance telephones and two wire system the people of Rome have a telephone system that is beyond compare. The switchboard is said to be one of the finest in the State. The board is equipped complete for 700 telephones and so arranged that the ultimate capacity will be 1,000 'phones. At present the directory of the company shows that there are 275 'phones ready to be connected up and the officials are very much pleased with the prospect. New subscribers are being secured at the rate of five per day and without doubt the company will have from 400 to 500 subscribers connected by October 1. In a recent interview, an official said: By September 20 the Home Telephone Company will have its toll lines completed from Rome to Camden, Taberg, Oneida, Verona, Vernon, Verona Springs, Clinton, Clark's Mills, Kirkland, Waterville, Oriskany Falls, Deansville, Lowell, McConnellsville, Blossvale, Stittville, Holland Patent, Boonville, Lee, Lee Center, Lorena, Point Rock, West Leyden, Constableville, Delta, Lowville, Lyon's Falls, Vienna, West Branch, West Leyden and almost every postoffice in Oneida and Lewis Counties. In Oneida County the company connects with the exchange of the Camden Telephone Company, which has 100 subscribers in Camden, the exchange of the Clinton Telephone Company with 100 subscribers, the exchange at Boonville with 100 subscribers and with exchanges at Waterville and Oriskany Falls with 200 subscribers. Before October 1 the long-distance copper lines of the Rome Home Telephone Company and the Syracuse Telephone Company will be connected at Oneida, which will give this company service with 2,000 subscribers of the Syracuse Company, and to all towns reached over the Syracuse system.

A contract was recently let by the new Union Telephone Company of Glens Falls, N. Y., to the Eastern Electrical Construction Company of Philadelphia for the equipment of its system, which will include toll lines to Troy or Albany and Luzerne, Corinth, Lake George, Warrensburg, Chester, Ticonderoga, Schroon Lake and other northern towns, and also Granville, Cambridge, Salem, Castleton and other towns in Washington County and Western Vermont. About 4,000 poles will be required. The cost of the plant will be more than $100,000. The switchboard will have a capacity of 1,500 telephones and all will be long-distance instruments. It is expected that the plant will be ready for use not later than January 1.

The telephone committee of the board of aldermen of Worcester, Mass., will have the franchise of the Citizens' Telephone & Telegraph Company ready this month. The work of the committee goes on smoothly and the members are agreed on every vital point. The preparation of such a franchise requires careful work and naturally takes considerable time.

Work has begun on the spur of the telephone line which will connect Chili Station, N. Y., with the main line.

Telephone Competition.

The right of telephone competition in Kansas City, Mo., is undoubted. The value and expediency of two systems is a matter which is apparently about to be demonstrated. The long fight in the council on this question was terminated a short time ago by the passage in the lower house of the ordinance granting a franchise to the Missouri Interstate Company.

All possible care seems to have been taken in the preparation of the ordinance to prevent the consolidation which usually follows the attempt to establish competition in public utilities. The new company has placed itself under the strongest possible promises to redeem its pledges, and the mayor and the council are, apparently, fully satisfied as to the sincere business intentions of the rival corporation.

The practical result of two telephone companies in Kansas City will be awaited with a blending of curiosity and apprehension that it will carry with it some annoyance with its anticipated benefits. Outside of the persons personally interested in the scheme, competition was favored only as a means of curing the defects in the service of the Missouri & Kansas Company. Had this been satisfactory as to quality and cost there would have been no effort made to establish a rival system. "In such a public utility as telephone service monopoly seems to be almost a logical condition," says a Kansas City paper. "There is needless expense and trouble in maintaining two machines, which would seem to be a necessity where there are two companies. Competition gave Kansas City dollar gas. Whether the same expedient will improve its telephone service is something that remains to be discovered."

The Mutual Telephone Company has made a liberal reduction in tolls on the Winston and Elkin, N. C., line. They are now probably not more than one-half the usual charges for same distances. The company hopes by this means to encourage the public to use the service freely. In order to make the service more satisfactory it has been found necessary to establish stations for use of the public in different parts of Winston.

The Missouri-Kansas Telephone Company of Wichita, Kan., is rushing the work in the placing of its new switchboard in position. The work will be entirely completed by the latter part of the month and Wichita's service will be in splendid condition. New cables for the business there are being put up and each contains ten wires.

A short time ago the officials of Williamsport, Pa., and the North and West Branch Telephone Company, met at the city hall, in accordance with their advertisement, to hear complaints of people who did not want the poles for the new line placed in front of their homes. No person put in an appearance, and consequently it is supposed that nobody will complain. The work of erecting the poles will begin soon.

The lines of the Ansonia, Conn., Telephone Company, a local system in operation in Ansonia, Derby, Shelton, Seymour and Oxford, and those of the local system of Woodbury, operating in Woodbury, North Woodbury, Hotchkissville, South Britain, Southford and Southbury, were connected recently in Oxford after the stringing of seven miles of wire. This establishes long distance communication between the two systems. The wires are working well and conversation is surprisingly distinct.

The wires of the Rochester, N. Y., Telephone Company in the outskirts of that city were somewhat damaged by the recent wind storm. No serious damage was done, however, as most of the wires of the company are underground and were not affected by the storm. Under the direction of Superintendent of Construction C. O. Harris the wires were put in shape, and all the 'phones of this company are working in the usual manner.

The East Tennessee Telephone Company is making many improvements in its plant at South Pittsburg, Tenn. The company has a force of men engaged stringing twenty wires between South Pittsburg and Jasper. The same number of wires will be placed between South Pittsburg and Bridgeport, Ala. When these improvements are completed subscribers in the three towns can talk to each other without additional cost.

The question of the site for the new Holyoke, Mass., telephone exchange has been decided, and a fine fireproof central exchange will be built as soon as plans can be furnished. The cost of the building with switchboards and connections will be about $60,000.

The telephone line from Oakland, Ore., via Stephens, Umpqua Ferry and Coles Valley to Millwood, promises to be a sure thing.

The manager of the Springfield, Mass., division of the New England Telephone Company has notified manager Bradley of the Pittsfield, Mass., district, of an entirely new plan to secure new subscribers to the service of the company in Pittsfield. The plan is to give the use of metallic circuit, long distance transmitter telephones on party lines to merchants and resident property owners for a period of four months. This of course is offered only to those who have not telephones at their residences. Canvassers are to shortly arrive in Pittsfield, and will make the round of the business houses of the city. Any reliable merchant who wants a telephone placed at his residence for a period of four months can do so. If at the end of that period he finds that the telephone is of no service to him the company will take out the 'phone, and the trial service will not cost him anything. If he is satisfied with the trial that the 'phone has been of service and desires to retain the use of it he will be required to sign a year's contract with the company.

There is every indication that the People's Telephone & Telegraph Company of Knoxville, Tenn., is preparing to greatly enlarge its toll line territory within the next few months. The company held its annual meeting a short time ago, and the officials at that time would give out no information as to what was done, except as to mere routine matters. It had been stated previously, however, that a decision had been reached to add to the territory already covered by the company's wires and the wires of the independent companies with which it has toll line connections, and this policy has, in fact, been carried out steadily for the past two years. It was learned recently on the highest authority that a new system is being put in at Louden, Tenn., and a gang of workmen, also employes of the People's Company, is at work in Williamsburg, Ky., where a similar exchange is being put in. It is understood also that the Lexington, Ky., independent telephone company is making large contracts for poles, to be delivered not later than October 1, and that a new exchange is to be put in there as soon as the materials can be gotten on the ground. Later, toll line connection will be established with Williamsburg.

The Bell Telephone Company, which includes the Ridge Road in West Seneca, N. Y., in its Buffalo district, has received many complaints of late from subscribers over the ervice furnished, and in most instances the complaints have been fully justified. On many days during the last six months the lines have been out of order, and at other times there has been such a buzzing noise on the line when a receiver was held to the ear that it was impossible to hear any conversation. Another disagreeable feature commented upon mostly by the women of the households supplied with telephones is that strange men have been calling at the houses every few days on one pretence or another to repair or look at the telephone. It has been very seldom that the same man called twice. The Bell Telephone Company, realizing the force of the complaint made by the women, has given to each of its employes a card stating that they are in the employ of the Bell Telephone Company, which the employes are expected to show before entering a house.

The wires of the New Augusta, Ind., Telephone Company were lately connected with Indianapolis, through those of the New Telephone Company. The New Augusta Company now has about twenty-five miles of wire stretched. It connects with several junctions in the oil fields near Broad Ripple. The line will soon be extended to Trader's Point and Flackville. It is a recently organized concern. William B. McDonald is president.

The new telephone line from Ebenezer to Beaver Ridge via Cedar Bluff and Ball Camp, Tenn., was opened for business a short time ago. The line is a part of the East Tennessee Telephone Company's long-distance toll system.

The business men of Norfolk, Va., are certainly interesting themselves in the telephone situation. Committees are investigating the question of rates, and the result no man knows. Each of these committees means business, and when they report it will be interesting.

The Oregon Telephone Company gives notice that an office has been opened at Crawfordsville, Ore.

TELEPHONE INCORPORATIONS.

The Massillon Telephone Company, Massillon, O. Capital stock, $75,000.

The Athens County Telephone Company, Athens, O.—to construct and operate a telephone line. Capital stock, $15,000. Incorporators: C. L. Jones, G. W. Duffee, W. E. Moler, A. F. Holmes and E. J. Holmes.

The Lawrence Telephone Company, Ironton, O. Capital stock, $24,000.

GENERAL NEWS.

What is Going On in the Electrical World.

LIGHTING.

Bryant, S. D.—W. Denevan has submitted a proposition to the citizens of this place to put in and operate an electric light plant.

Butte, Mont—The Butte "Journal" is agitating the question of an electric light plant to be owned by the city.

Christiansburg, Va—This city will build an electric light plant. D. M. Munroe, engineer of Washington, D. C., has prepared the plans. M. H. Tompkins, mayor.

Coffeyville, Kan.—Coffeyville has voted $20,000 worth of bonds for the purpose of putting in an electric light plant.

Dalton, Ga.—This city has purchased a gas plant and contemplates the erection of an electric light plant as soon as arrangements can be made.

Fayette, Miss—Machinery and fixtures will be purchased for an electric light plant. Address Fayette Oil Works, Fayette, Miss.

Gloucester, N. J—The South Jersey Gas, Electric & Traction Company will soon abandon its Woodbury electric light plant and furnish power for that city from the plant recently acquired here.

Griffin, Ga.—The Griffin Knitting Mills of this city want to buy a dynamo for 100 lights and contract for putting up the plant.

Hawkesbury, Ont.—Alexander Cote, electrician at the Riordon Paper Mills, has recently been canvassing the town with the view of having an electric lighting plant established.

Heyworth, Ill.—Messrs. Blair & Newell of Chicago, will erect an electric light plant here.

Huntington, Ind.—Boyd & Company have made a proposition to the council to erect an electric light plant.

Iowa Falls, Ia.—The Iowa Falls Electric Light & Power Company will reorganize with a capital of $40,000.

Jewett, Tex.—Keeton & Steel of this place are in the market for a new or second-hand 300 to 500 incandescent dynamo.

Laurel, Md.—This city has issued bonds for the building of an electric light plant, and bids will be received by J. C. Howell, secretary of the Laurel water board.

Magnolia, Miss—J. H. Jenks, an electrician from St. Louis, has been looking over this town, and making estimates as to the cost of erecting an electric light plant.

Manitowoc, Wis.—The city of Manitowoc is negotiating for the purchase of the electric light plant.

Marion, Va.—The council has decided that this place shall have an electric lighting system.

Mendon, Mich—The citizens of this place have decided in favor of the municipal ownership of the electric lighting plant, and will issue $8 000 in bonds, payable at the rate of $1,000 per annum.

Normal, Ill.—This town is agitating the queston of owning and operating an electric light plant.

Oxford Junction, Ia—The citizens of this place have voted in favor of granting an electric light franchise.

Pembroke, Ky.—The city council has contracted with Walter S. Bumbus to light the streets with electricity.

Pontiac Mich—J. W. Martin states that the Oakland County Telephone Company, of which he is the manager, is considering the advisability of establishing an electric plant to furnish light, heat and motive power.

Port Huron, Mich.—The City Electric Railroad Company is preparing plans for a new plant to be erected on Beard street.

Reinbeck, Ia.—A party from Davenport wants to put in an electric light plant here.

Sedro, Wash—Shrewsbury & McLain, mill men of this city, intend to put in an electric light and power plant at once.

Sidney, O.—Bids are asked until September 22 for lighting this city for 10, 15 or 20 years from August 1, 1901, requiring about seventy-five 2,000 cp. arc lights. Address F. Mumford, chairman of the light committee.

Stephen, Minn.—The Triumph Electric Company of Cincinnati has been awarded the contract to erect the new electric light plant here.

Sturgeon, Mo.—J. K. Fyfer, of Centralia, is figuring with Col. O. D. Gray and other capitalists of this place upon the furnishing of electric lights for Sturgeon.

Talladega, Ala.—This city will erect an electric light plant.

Thief River Falls, Minn.—At a recent meeting of the city council it was voted to put in an electric light plant.

Weldon, N. C.—A large electric plant will be established on the canal of the Roanoke Navigation & Water Power Company.

West Plains, Mo—Plans are being prepared for the erection of a new electric light plant here.

Wyoming, Ia.—This place has been asked for a franchise to establish an electric light and power plant.

Zanesville, O.—A deal has been completed by which a controlling interest in the property of the Zanesville Electric Light Company has passed into the hands of a Boston syndicate, represented by the International Trust Company of that city.

STREET RAILWAYS.

Angola, Ind.—A special election has been called to be held October 10 to vote on the proposition to vote an appropriation of $20,000 to aid in the construction of the electric railroad projected to be built from here across the Michigan line, with Coldwater as the terminal point.

Battle Creek, Mich.—The right of way for the proposed electric road from this city to Coldwater has been secured, the route selected running through Burlington and Union.

Bryan, O.—Local and Eastern capitalists have practically secured the right of way for a new electric road to connect Toledo with this place.

Columbus, O.—The Columbus, London & Springfield Electric Railway Company has increased its capital stock from $100,000 to $1,000,000. The company is pushing the road to completion in this city, and has about finished its line from Dayton to Urbana.

Gardiner, Me.—The Gardiner Electric Railroad Company will apply for a charter for an electric road to South Gardiner.

Grand Rapids, Mich.—The survey of the route of the proposed Grand Rapids-Holland Electric Railroad has been completed and construction work will begin very soon.

Lebanon, O.—The county commissioners lately granted to J. P. Wolf and W. P. Sunderland a 25-year franchise for building and operating an electric car line over the Dayton, Centerville and Lebanon pike from the corporation line of Lebanon to the north boundary line of the county.

Lenox, Mich.—It is proposed to build an electric road from this place to Sanilac Center, about 40 miles. G. R. Lovejoy, of Mt. Clemens, is interested.

Natick, Mass.—A company is projected to build an electric railroad connecting this place and Sherborn. It will also run to Holliston, making a shorter route to that town from here.

Sing Sing, N. Y.—The authorities are trying to compel the company controlling the trolley road here to put fenders on the cars.

South McAlester, I. T.—The Union Electric Railway Company, lately capitalized at $122,000, will construct and operate an electric railroad through the streets of this town, and one or more lines from here to and through the towns of McAlester, Krebs, Cherryvale, Alderson and Hartshorne, a total distance of twenty-five miles.

Springfield, Ill.—The proposed electric railway between this city and Jacksonville is again under consideration.

West Boxford, Mass.—The proposed electric railroad between Andover and Groveland Bridge, through this town, is being talked of, and when a location is granted the work of building the road will be pushed ahead.

Weyauwega, Wis—A. R. Hutchinson of this place states that surveys have been made and rights of way secured for the proposed line between Berlin, this city, New London and Wautoma about 70 miles long to be operated by electricity.

Whitehall N. Y.—The Whitehall & Granville Railroad Company of Washington County will operate a street surface railroad by electricity or other power, except locomotives, with a capital of $750,000.

MANUFACTURING.

Hamilton, Ont—The Leitch & Turnbull Company, Limited, of which Andrew Leitch is president; Wm. Leitch, vice president; E. H. Thompson, secretary-treasurer; William Turbayne, electrical engineer, and James Turnbull, director, will manufacture elevators and electrical machinery.

New York City.—The Unique Electric Device Company, of which James P Hines, Michael Sorhan and Michael Hines are the directors, was recently organized here to manufacture electric machinery and appliances with a capital of $10,000.

Philadelphia, Pa.—The Navy Department has awarded a contract for the installation of an electrical conduit system at the Washington navy yard to George W. Ledie of this city at his bid of $15 246.

Trenton, N. J.—Charles Smith has taken the old Pope & Lee Pottery on Meade street, and is having it remodeled for the purpose of manufacturing electric supplies.

COMPANY MATTERS.

Clyde, N Y—By order of the Supreme Court, the real, personal or mixed property, effects, assets, privileges and franchises of the Clyde Gas & Electric Company will be sold at 10 A. M. September 26, at the office of the company in this place, by the temporary receiver, Edward Moir.

Niles, O.—The Niles Electric Company's plant was sold here last week by W. G. Hurlburt, receiver, to J. H. Orwig of Niles, the highest bidder; consideration, $1 500.

POWER AND TRANSMISSION PLANTS.

Hanford, Cal—The Mammoth Electric Company has filed upon water rights in the upper San Joaquin River, which it is estimated, at the lowest stage of the river, will develop 55,000 horse power. The cost of installing the plant will amount to upwards of $2 500,000. It is stated that the work of transmitting electric current to San Francisco will soon be under way. H. G., O. M. and R. C. Lacey, S. E Biddle, J. E. Rawlins and others are interested.

Henderson, N. C—The Henderson Power & Lighting Company has lately been formed here, the purpose of which is to build and operate electric light and power plants, to sell and transmit electric current, power, etc., to manufacture and sell ice and conduct a cold-storage plant. Samuel H. Pulliam and E V. Williams of Richmond, Va., and J. H. Bridgers of this city have an interest in the firm.

Redding, Cal.—A fifty-year franchise to conduct an electrical plant and furnish power and lights to mines and the unincorporated towns of this county was sold by the supervisors to A. H. Davidson of San Mateo County.

AUTOMOBILES.

Chicago, Ill.—The Electric Storage Battery Company announces that it has sold the use of its patents for automobile purposes to the Columbia Automobile Company, for which it received $1,000,000 of the latter's $3,000,000 of capital stock. The Electric Storage Battery Company says it has booked orders so far this year amounting to $2,000,000.

Portland, Me—The Waltham Motor Carriage Company has been organized here for the purpose of manufacturing and dealing in automobiles, bicycles and electric goods, with $300,000 capital. W. A. Ingraham of Lowell, Mass., is president, and R. B. Johnson of Waltham, Mass., treasurer.

Springfield, Mass.—J. F. Duryea of this city is president of the Hampden Automobile & Launch Company, organized at Portland, Me., with a capital of $100,000, for the purpose of dealing in automobiles and launches.

Washington, D. C—The American Bicycle Company has entered extensively into the manufacture and sale of automobiles. The electric vehicle is the ideal carriage here for the business or professional man and for ladies' use.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16⅝c.; Lake, 16⅝@16¾c.; casting, 16⅜@16½c.

Western Union directors have formally declared the regular quarterly dividend of 1¼ per cent. on the stock.

There has been listed on the Philadelphia Stock Exchange $1,000,000 additional stock of the Bell Telephone Company.

The North Detroit Electric Railway has executed a $600,000 mortgage on its lines to the City Trust Company of New York.

Directors of the Manhattan Elevated Railway Company have declared the regular quarterly dividend of 1 per cent., payable October 1.

The United Traction & Electric Company of New Jersey has declared a dividend of 1 per cent., payable October 1. Books closed September 10 and reopen October 2.

The Metropolitan Street Railway Company of New York has declared the regular dividend of 1¾ per cent., payable October 15. Books close September 26 and re-open October 16.

The Safety Car Heating and Lighting Company has declared a regular quarterly dividend of 2 per cent., payable October 1. Books closed September 15 and re-open October 2.

The Brooklyn Rapid Transit Company's annual report, although filed with the Railroad Commission at Albany, will it is understood not be ready for distribution for about a week.

The Jackson, Mich., Street Railway was purchased from the receiver recently by a New York broker for $155,000. It is expected that it will be consolidated with the Kalamazoo, Battle Creek & Jackson Electric Street Railway system.

The Columbus, (O.) London & Springfield Electric Railway has increased its capital stock from $100,000 to $1,000,000. The road is being pushed to completion and has about completed its line from Dayton to Urbana.

Directors of the General Electric Company have declared a quarterly dividend of $2 per share on the common stock, payable October 15. This is an increase of ½ per cent. and places the stock on an 8 per cent. basis.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 17@20; New York Electric Vehicle Transportation, 7½@8; New England Transportation, 3½@3¾; Gramophone, 35@40.

The annual report of the Auburn (N. Y.) City Railway Company shows the net earnings of the corporation to be $76,237; operating expenses, $50,002; other income, $342; fixed charges, $22 416; net income, $4 160; total deficit, $21,920,

Specie movements at New York last week were: Silver imports $136,109, exports $964 428; gold imports $30,228, exports $9,800. Since January 1: Silver imports $3 510,216, exports $33 947, 213; gold imports $1,621,464, exports $47,760,536.

P. A. B. Widener says of the Metropolitan Street Railway Company: "We have plenty of money on hand for all the needs of the road, so that the new issue of $7,000,000 stock, which has been authorized, will not be made for a long while yet."

The Rockland County, N. Y., Traction Company has been incorporated with $300,000 capital. The length of the road will be 30 miles, entirely in Rockland County. C. W. Reeves, of Brooklyn, takes 2 958 of the 3,000 shares. Henry F. Shields and Ethelbert D. Harris are two of the directors.

The Gas and Electric Company of Bergen County, N. J., reports for June, July and August: Gross earnings $52,230, expenses and taxes, $32,491; net earnings $19,739. The company reports the number of consumers on September 1 at 5,400, an increase of over 60 per cent. over same date last year.

At a special meeting of the Chicago Board of Trade on the 14th inst., a resolution authorizing the president and secretary to execute contracts with the Exchange Telegraph Company was adopted. One of these contracts provides for the completion of a comprehensive telegraph system, connecting the important exchange centers, on or before December 31, 1904. upon completion of which line the Exchange Telegraph Company is to have the exclusive telegraph space in the Exchange hall and Board of Trade Building in Chicago.

An English copper firm says of the situation: "The outlook is any thing but satisfactory for the average consumer of copper, who has been compelled to pay very much more than he regards as a fair price for the metal, but by the same token the producer it promised a further run of prosperity which he will do his best to prolong in all probability by not being too anxious to increase his output materially. If the smaller miners in America actually did their best during the first half of the current year, it seems a fair inference that not only the mines controlled by the Amalgamated, but some of the large independent properties, deliberately decreased their production. The same remark applies to Europe. The American production for the six months was 134,577 tons, compared with 124,488 tons last year and 120,487 tons in the first half of 1898."

Russell Sage is thus quoted regarding two of the properties in which he is largely interested: "The Western Union is doing a very satisfactory business, and is showing a slight increase as compared with last year, notwithstanding the cutting off of Chicago quotations. Too much seems to have been made of this factor. To contend that it would amount to the wiping out of surplus after dividends and might endanger continuance of dividends at present rates is absurd. Money is being expended freely on maintenance, and the company is better equipped and the property in altogether better physical condition than ever before. The work of electrically equipping the Manhattan lines is proceeding satisfactorily, and on or about October 1 we will be in position to show what we can do in the actual running of trains by electricity on the Second and Ninth Avenue lines. I hope for great results."

ELECTRICITY.

Vol. XIX. NEW YORK, SEPTEMBER 26, 1900. No. 12.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4021 Cortlandt.

SUBSCRIPTION RATES:

United States, ...	$2.50
In Clubs of Five or More, . . .	2.00
Foreign Countries, ...	4.50
Single Copies, ...	10 cents

Remit by Express, Money Order, Draft, Post Office Order or Registered Letter.

ADVERTISING RATES.

As Electricity reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application.

Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter

EDITORIAL NOTES.

Havana's Street Railway. The various islands acquired by this country as the result of the war with Spain are already feeling to a greatar or less extent American enterprise and push. In the Philippines it must be acknowledged the extent is as yet less than in Porto Rico and Cuba, although many improvements have been made in and about Manila since Admiral Dewey entered that harbor two years ago.

In Porto Rico arrangements are under way for the construction of up-to-date electrically-propelled street railways, as well as electric lighting plants, while Cuba, owing probably to its proximity to this country, has felt the touch of American methods more than any other of the islands. In Havana the antiquated street railway has been taken over by a number of capitalists who some time ago organized the Havana Electric Railway Company. Up to the time of the organization of that company the street railway system, known as the Ferro-Carrill Urbain, consisted of about 25 miles of tracks, located upon 13 miles of streets. Considering the size of the city, this amount of mileage, according to Mr. Hanson, president of the Havana Electric Company, was totally inadequate for the proper accommodation of the public and based on the experience of American cities, could be increased to three or four times the amount with advantage. The Ferro operated 61 cars and 11 steam engines. The number of passengers carried on the street railway lines of Havana before the war, reached 7,500,000 per year, even at the high rate of 15 cents, 10 cents and 5 cents, which were charged on many of them. The Havana Electric Railway Company, which has taken over the property of the Ferro Company, has now in course of construction about 80 miles of track, and they propose to operate on their system about 120 cars. Owing to the narrow streets in certain parts of Havana, and after the company's plans had been submitted to the Governor, it was deemed proper to fix upon two maximum rates of speed on narrow streets. On such streets the speed will be from six to eight miles an hour, while eight to fourteen miles an hour is to be the speed on the wider thoroughfares. On each route cars will be run on a varying schedule, to suit the requirements of travel, starting with ten minutes' headway, reducing the headway to 7½ minutes, and then to 5 minutes, so that during six hours daily the headway on each of the four lines will be 2½ minutes, Night car service will be established from midnight until regular day car service.

The new track construction consists of 7-inch girder rails, weighing 90 lbs. per yard. The Havana authorities have insisted that the double overhead trolley system be installed, which will prevent the possibility of damage by electrolysis to any underground metal structures that may be laid before or after the completion of the road. It is expected that the line will be ready for operation by the middle of December when the residents of Havana will have at their disposal as adequate means for transportation as are to be found in most small cities of the United States.

* * *

An English View of Nikola Tesla's Invention. The patent granted Mr. Nikola Tesla on August 14 for a method of insulating electrical conductors, and which was referred to in the issue of Electricity of August 22, seems to be attracting considerable attention in England. The process, as will be recalled, consists in a word in placing the conductors in a trough below the surface of the ground and surrounding them by a frozen substance which is supposed to act as a perfect insulator. Owing to the present high price of coal in certain parts of Great Britain several English papers seem to think that if Tesla's scheme is practicable a large amount of money could be saved by generating electric current at points where fuel could be obtained cheaply and transmitting it to localities in the Kingdom where high prices for fuel prevails. Referring to this subject editorially the N. Y. "Sun" recently said:

"Welsh coal now costs at Cardiff, its port of shipment, about $7, while North of England coal cannot be laid down at its shipping point, Newcastle, for much, if any, less than $6. Such prices obviously threaten to deprive England of her export trade in coal, which, last year, was valued at upward of $43,000,000, exclusive of the quantity sold to ocean-going steamers for steam-generating uses on their outward voyages. This is by no means the most ominous outcome of the situation, however. As the London 'Spectator' points out, the recent rise in the price of English coal portends lower

Digitized by Google

wages to all British workingmen but colliers, and more men thrown out of work. As the cost of each industry becomes greater, owing to the large sum required for the purchase of the power-creating combustible, the smaller factories will be closed one by one, and the larger factories will reduce their output. So far as producers are concerned, what dear coal means is ruin to small employers, diminished profit to large employers, and less work with less pay for the men employed. To consumers, on the other hand, it means higher prices for all manufactured products, although to the poor even a slight increase in the price of necessary articles is a hardship.

"An increase in the cost of clothing, for instance, can be met on the part of the workingman only by buying inferior articles or by pinching in his food. Still another privation is unavoidable, if the present prices of coal in England continue; as they must, unless English railways lower the charges for transportation, which nobody expects to see them do. Throughout Great Britain, during the winter, fires are a necessity of health, and, in a large part of the island, a necessary of life. It is certain, however, that, when the price of coal passes a certain figure, even the preservation of life will have to be disregarded by the poor. Warmth is a luxury for which people of limited means cannot pay more than a certain price.

"If, then, Mr. Tesla's scheme be practicable, two indispensable things may be secured by the mass of England's population, namely, cheapness of manufactured products and cheapness of warmth."

The "Spectator" further holds that an incalculable improvement would be effected in the conditions of British life if Mr. Tesla's method of transmitting electricity should prove practicable, and should be adopted on a large scale in great Britain. Electric lighting would be so cheapened that householders would no more be poisoned by gas, or run the risk of fire from kerosene lamps. Electric heating would be introduced, and place Englishmen as regards the air in their houses on a level with the inhabitants of Southern Europe. In a word, light and warmth would be supplied with as much ease as water, and possibly at a smaller cost.

There is no doubt but what Mr. Tesla's invention would materially tend to benefit mankind if it proves practicable. But in the case of new inventions and untried things the "if" should not be overlooked, and as we stated last month there would seem to be several reasons why this method of insulating electrical conductors will scarcely prove a commercial success. It might be well therefore for our English cousins to await further developments before becoming too enthusiastic on the subject.

Trade and Its Possibilities in Scotland.

The recent tendencies of trade in certain sections of Scotland, especially in Edinburgh, indicates that American manufacturers and exporters are giving due attention to a market which was practically long neglected. Although American goods of various kinds have been sold in Scotland to a limited extent for many years, yet it can hardly be said that there was any serious effort to build up a trade in any particular line until the manufacturers set themselves to the work of placing their wares directly before the people by sending representatives there, either from the United States or from the London agencies.

So long as our manufacturers seemed to be content to allow a general agent in either London or Liverpool simply to take orders from Scotland just whenever they happened to receive any, the growth of the trade was, as a matter of sequence, exceedingly slow. When, however, modern methods of trade extension were adopted, and agents from the United States as well as salesmen from London and Liverpool, were sent among the Scottish business men to show wares and give prices, there was a quick change for the better in the volumn of trade.

In the first instance manufacturers in this country took a wrong view of Scotland and its possibilities. They seemed to be under the impression that this division of the United Kingdom was a mere commercial appendage of England; whereas, as a matter of fact, the laws, methods, business habits and customs in Scotland differ very materially from those maintaining in England, and to obtain trade there a foreign manufacturer must present himself to Scottish business men, and meet their requirements, quite irrespective of any connection, however successful, that he may have with Great Britain in other parts.

The Scotchman thinks for himself, and selects goods upon what he regards as their merits. No one is more alert than he to discover the real value in goods of any kind, and it follows that the best way to sell goods of real value in Scotland is to bring them directly under the notice of the best business houses, and to give to those houses the benefit of the lowest price. American manufacturers are adopting this plan, and they find that it pays. This is pretty clearly shown by the increasing proportion of American exports to Scotland through the Scottish ports, thus saving, in large part, the expense of inland transportation. This proportion will, it is probable, grow steadily in the future, inasmuch as the facilities for all-water transportation between North Britain and the United States are improving.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

The "Electrical World and Engineer," in its issue of September 22, makes the amende honorable as follows:

"In our last issue attention was prominently called to the electric lighting situation in San Juan, Porto Rico, where an attack of suspicious and even vicious character has been made on an enterprising American company putting in a new street lighting and trolley system there. To support the attack alleged interviews with two editors of two New York electrical journals were published in San Juan, roundly damning the alternating current and aerial circuits. We referred to the dubious nature of these interviews and ventured to hope that we might elicit a denial that would counteract the intended injury to the new company in San Juan. Mr. W. L. Hedenberg, editor of Electricity, whom the local Porto Rican newspaper had named, now comes forward in his latest issue and, as we anticipated, contradicts the interview alleged to have been had with himself as follows: 'I beg to say right here that the statements credited to me are false from beginning to end.' This emphatic refutation should give a quietus to the clumsy conspiracy in our West Indian annex against American enterprise and modern electrical apparatus."

As was to have been expected and in accord with its usual policy of allowing its first statement to stand, even when wrong, the "Electrical Review" shuns the subject entirely. Really, some papers have no more backbone than a jellyfish.

The Rensselaer Polytechnic Institute of Troy, N. Y., will have in operation by October 1, a new electrical laboratory, containing sixteen machines, generators and transformers, together with a full equipment for practical tests. These have all been presented to the Institute during the past year and will afford excellent opportunities for students in electrical engineering.

A new smoke consumer was recently tested at the plant of the Commercial Electric Company of Indianapolis, Ind. The test was made under the direction of the building inspector, who still says he hopes to be able to stop the smoke nuisance.

It is announced that G. W. Miles will erect an electric plant to cost $40,000 at East Radford, Va., to furnish power to run machinery, and will offer as a special inducement to enterprises to locate there electric power gratis for two years at any capacity.

The Federal District Street Railway Company which operates the street railway lines of the City of Mexico and Puebla, contemplates connecting the two cities with an electric road. There are a number of thriving towns in that vicinity, which will also be connected with the City of Mexico by electric lines.

Howard K. Wood, of the Corporation Trust Company of New York, who recently returned from a several months' trip in Europe, said that he was surprised at the remarkable increase in the amount of American goods that can be seen everywhere in the principal cities. "The increase has become marked within two years," he said. "All the elevators one can see in London and Paris are of American make, and n the new rapid transit line, which is now in operation in London, most of the electric appliances bear American names."

Electricity as a motor for regular railway trains has been found 15 per cent. cheaper than steam in the experiments recently made at Berlin on the Wansee-Bahn.

E. B. Pope, Western passenger agent of the Chesapeake & Ohio Railway at St. Louis, Mo., has lately invented an ingenious device, which consists of a second electric "headlight," or searchlight, mounted upon the roof of a cab of a locomotive, pointing always to the rear of the train, therefore he calls it a "hind light," and the chief object of the invention is to protect the hind end of the train from being run into by any train that may be following it. The "hindlight" rests upon the roof of the cab, and is attached to one end of a lever about eight feet long, and is steadied and controlled by two parallel rods, and by means of a simple arrangement of cylinders and compressed air can be elevated six or seven feet above the roof of the cab or swung around at right angles to either side of the cab, so that the powerful light can

Digitized by Google

be seen at a great distance from any point in the rear of or on either side of the train. Intense darkness, rain, snow or fog simply render the light more prominent, and the engineer can instantly change the color of the light from white to red or green, as occasion may require.

IT is said that the electrical effects to be exhibited at the Pan-American Exposition in Buffalo, N. Y., next year, will exceed anything of their kind ever shown before. The enormous energy of the Niagara power plant will be available for the contemplated illuminations and this will mean that a flood of electrical energy will be poured in to maintain the really marvelous display of electric light that will be shown. It has been suggested that an artificial sun shall be shown, consisting of an immense plate of carbon heated to blazing incandescents by means of five or ten thousand horse power of electrical current. Such an apparatus would develop many million candle power and would really rival the sun in its illuminating effect in the immediate neighborhood.

OMAHA capitalists propose to tunnel the great continental divide, 80 miles west of Denver, and 12 miles south of Georgetown, and operate an electric road through it. It will start at the base about 14 miles from Grant and terminate at the head waters of the Snake River, will be 7,000 feet long and 1,700 feet deep. The object is to facilitate mining operations. The tunnel will be built of sufficient size to admit a steam railroad train, and may be utilized by some one of the great transcontinental lines as a short cut.

ISRAEL A. KELSEY, until recently general manager of the Winchester Avenue Railroad Company, and who controlled large blocks of stock in several trolley companies in Massachusetts and Rhode Island, died at his home in West Haven, Conn., Monday, aged 41. Mr. Kelsey was attacked with nervous prostration while aboard his yacht in the early summer and since then had been confined to his home with malarial fever, which finally merged into typhoid fever.

ACCORDING to reports, the introduction of electric traction and lighting into South Russia is making rapid headway. A Belgian has obtained a concession to construct and work an electric tramway in the town of Poltawa. The necessary capital will be found by a limited company to be promoted in Brussels. It is intended to commence the construction of the line next spring. Further, the Belgian Street Railway Company in Odessa has obtained a concession to construct and work an electric railway in Winnitza, and to light the town by means of electricity for a period of 30 years. Not long since a cable works was opened in Kiew. At present it is producing only insulated wires for telegraph and telephone work, but later on it is intended to install a plant for the manufacture of electric light cables.

UP to the present there have been two general methods for operating railroad switches from a central tower. The most common and oldest of these is by means of manual levers in the tower, mechanically connected to the track switch by a system of rods, chains or wires. The second system known as the electro-pneumatic, consists of electro-magnets, controlled from the central tower operating valves which in their turn control the compressed air used to change the switches and signals. Now there comes a new system, the "all-electric" as it has been named, which consists simply of a small electric motor at each switch, whose action is governed from a central tower. The only connection necessary is the two wires of the motor circuit. This system has recently been installed in several railroad yards in Chicago, and is giving satisfaction. The practical perfection of the whole apparatus, which in theory is so simple, and especially of the electric interlocking machine in the tower, is the result of several years' experimental work.

THE Green Signal Corps of Dallas, Tex., is now drilling with the heliograph. "The heliograph," said Lieut. Camp, "will transmit messages from one eminence to another accurately 85 miles, and it is claimed that it has done so 100 miles. We are drilling at night with the instruments under the electric lights, which answer every purpose for short distances. Merely for drill purposes, as we can learn as readily by this means as with the sun. During the fair we propose to put a searchlight in the cupola or tower of the courthouse, and another in the tower of the exposition building on the fair grounds and give exhibitions of our skill as a signal corps in transmitting messages by night or by day for long distances where telegraph or telephone systems can not be used, as in the case of war, for instance."

GREAT expectations are entertained and many plans are being formed in Porto Rico for the installation of short inland electric railways from the central range to the coast. The power is to be developed through the agency of many streams to be met with in every part of the mountain range, which traverses the island from end to end. If all that is expected in the way of new roads and other electrical works is accomplished there will be a field in Porto Rico for considerable electrical machinery and material. The only road on the island, from the capital to Rio Padres, some nine miles in length, is shortly to be equipped electrically.

A. J. CASSATT, of the Pennsylvania Railroad, who reached home from Europe last week, said that while in London he looked into the underground railroad system. "It is one that will be adopted in this country," he said. "They have gone down eighty feet in London, the purpose being to get below all pipes and foundations. At that distance below the surface they run trains that carry an average of three hundred each. The motive power is electricity, and in equipment they have closely followed the elevated road in New York. The tunnel is dry and there is good ventilation. The constant movement of trains forces the air out of the shafts and out of the elevators used to lower the passengers, and there consequently is no vitiation. While there will, of course, be surface transit still I am of the opinion that the underground system will be taken up in our large cities."

THE signal officer at Washington, D. C., has received a report from Lieut. D. G. Burnell, who is constructing the telephone line from Fort Valdez to Fort Egbert. He hopes to have the line constructed and in use this winter. Fort Valdez is on the open sea, about 100 miles north of Juneau, and near the mouth of the Copper River, while Fort Egbert is the post on the Yukon near the eastern boundary line. Lieut. Burnell says that anything in the way of reading matter that could be sent through the Quartermaster's Department for the enlisted men in Alaska would be most acceptable to the soldiers during the long winter that is before them.

THF BRITISH ASSOCIATION.

[From our London Correspondent.]

The 1900 meeting of the British Association for the Advancement of Science, which closed on Wednesday, September 12, at Bradford, has been an excellent one from an electrical point of view. Abstracts of some of the papers are now being reprinted in ELECTRICITY. One that was delivered from a few rough notes in his note book by Prof. S. P. Thompson was of great interest to the small company of practical electrical engineers, who happened to be assembled when it was delivered. It was devoted to a comparative consideration of the numerous types of dynamo construction and design in evidence at the Paris Exhibition, with special reference to several particular machines. It was a pity that so important a subject should be dealt with to so scant a company; but the professor is an eminent expert in dynamo design, and his complete paper will be welcomed by all interested in the subject, when it is published. On Saturday evening, the professor lectured himself into the affections of over 3,000 of the artisans and general populace of Bradford on electricity in the industries, and by means of many elementary experiments carried out in his own inimitable and pleasing way, the professor made his lecture more instructive than is sometimes the case with some lectures. He did not lose the opportunity for rubbing it into Brad ord people of what great advantage electric driving could be to them in the textile industries for which their factories were world-famous. He quoted instances of Swiss factories which had found their salvation by substituting for old methods the adoption of electric power. He dwelt in a most enthusiastic and convincing manner upon the necessity for such towns as Bradford supporting the large electric power distribution schemes. The next fifty years are rich in promises for the applications of electricity. The supply of electric power at cheap rates, he said, was a national and social question rather than merely municipal. He also did not forget to tell his hearers that he was the inventor of a surface contact system of electric tramway, at the same time advising them to dispense with the overhead wires! *Verb sap.*

An evening discourse to nearly 2,000 members of the Association, was delivered by Prof. Gotch, F.R.S., on "Animal Electricity." He held his hearers with unflagging interest from first to last, and explained in great detail the electric cell structure of electric fishes. Lantern slides and diagrams were thrown upon the screen showing these, illustrating the electric action and so on of skate, gymnotus, malapterurus, etc.

The titles of certain other papers have already been stated in ELECTRICITY. It only remains to be added that the meeting was a success, and that next year's conference will be held at Glasgow, opening on September 11. Prof. A. W. Rucker, F.R.S., will be the President.

It has been decided to allow women members to act on the committee. An argument used by Prof. S. P. Thompson in favor of this, was that one the best papers read at the Paris International Electrical Congress was that by Mrs. Ayrton.

ELECTROLYTIC ANALYSIS.

(Summary by our London Correspondent.)

The sixth report of the British Association Committee, which has been investigating the electrolytic methods of quantitative analysis since its appointment in 1894, completes its work. Hitherto the work of the committee has included a complete bibliography on electrolytic analysis up to the end of 1894, and experimental investigations on the electrolytic determination of antimony, bismuth, cobalt, nickel, zinc and the separation of antimony and zinc. This year's report deals with further work on the determination of bismuth, and with the determination of iron, its separation from manganese, and the application of the electrolytic method to the determination of iron in organic products. These experiments cover some of the most important applications of electrolytic analysis which required further investigations. The following are embodied as part of the report:

"The determination of bismuth (Part II)," by Prof. J. E. Reynolds and W. C. Ramsden.

"The determination of iron," by Charles A. Kohn.

(1). "The conditions under which iron is deposited from ammonium oxalate solution, and the most favorable conditions for its electrolytic determination," by C. A. Kohn and H. H. Froysell.

(2). "The influence of ammonium chloride on the electrolytic determination of iron."

(3). "The complete separation of the iron when deposited from ammonium oxalate solution; the sulphocyanide reaction for iron under the conditions of the experiments," by C. A. Kohn, F. J. Brislee and H. H. Froysell.

(4). "The presence of carbon in iron deposited from ammonium oxalate solution, and the determination of its amount," by C. A. Kohn and F. J. Brislee.

(5). "The electrolytic separation of iron and manganese in ammonium oxalate solution," by Kohn and Froysell.

(6). "The electrolytic determination of iron in urine and other animal products," by Kohn and G. C. Clayton.

Note on the Propagation of Electric Waves Along Parallel Wires.*

BY W. B. MORTON.

In the "Annalen de Physik" for June, 1900, a very complete investigation of this problem has been published by G. Mie. He finds expressions for the wave-length and damping of the oscillations, involving a series of ascending powers of the ratio of radius of wires to distance apart. The object of this note is to point out that the approximate solution, in which the square of this ratio is neglected, can be very easily obtained from the known solution for a single wire, as worked out by Prof. J. J. Thomson, and by Sommerfeld. The formula for the damping agrees with that given by Heaviside's simple theory when Lord Rayleigh's high frequency values are used for the resistance and inductance. Attention is called to an error in the formula for the Ko function in the work of Thomson, Sommerfeld and Mie, arising probably from an erratum in Heine's "Kugelfunctionen." It affects the numerical values worked out in Sommerfeld and Mie's papers.

* Abstract of paper read before the British Association for the Advancement of Science, held at Bradford, Eng., Sept. 8, 1900.

DUST FIGURES OF ELECTROSTATIC LINES OF FORCE.*

BY DAVID ROBERTSON, B.SC., A.G.T.C., A.I.E.E.

The method of getting pictures of magnetic lines of force by means of iron filings is so well known that it is surprising that the making of analogous pictures of electrostatic lines does not also form one of the regular lecture table experiments of every elementary class on electricity. More especially is this the case now that electrostatic phenomena, which at one time were considered of purely scientific interest, are every day becoming of more importance in the application of electricity to practical purposes.

Some time ago the writer described† a method of obtaining such pictures with the apparatus illustrated in Fig. 1. Tinfoil electrodes of any desired form and number are stuck on one side of a sheet of glass, and this is laid in the wooden frame, W F, with the tinfoil on the under side. A half-plate photographic glass is a convenient size to use, and then a plate carrier from a camera or an ordinary printing frame will serve to hold it, but larger plates may be used with advantage. Vertical connecting wires, with spring tops, make contact with the tinfoil electrodes, and put them into connection with the poles of an electrical machine through the bare connectors, C, and fine spirals of covered wire. These connectors are insulated from the table by a sheet of glass or ebonite. Each electrode will have a separate vertical wire, and the connections for any desired combination are easily made at the bottom by short pieces of bare wire. Another bare rod, S C W, lies across the two horizontal wires, so as to short-circuit the machine.
